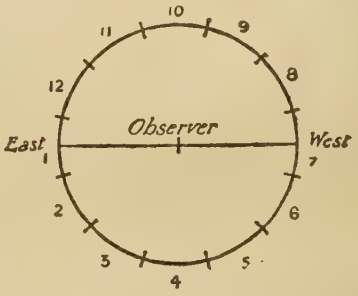
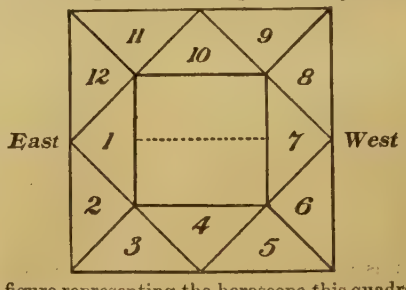
But there is likewise an apparent daily revolution of fixed stars and planets alike around the position of the observer, each of them crossing his meridian once in every 24 hours; while if they lie in the equatorial circle the intersection takes place exactly 6 hours after they rise in the east, and 6 hours before they set in the west. Hence the observer's celestial equator, too, is always laid out in 12 segments corresponding to the 12 constellations of the zodiac; and if we disregard the sun's daily eastward movement of one degree, we find that every two hours the zodiac changes its position relatively to the equator by one whole zodiacal sign of 30 degrees. Now the intermediate positions of the signs during these two hours being left out of account, the observer's celestial equator was once for all divided into 12 apparently stationary parts, each of these having its own meridian. The illustration below shows an equatorial section traversing the horizon and the celestial sphere. These parts were called 'houses,' and all the conditions found within them were treated as if stationed in their respective middle lines. Now, as the enumeration of the houses began in the east, and then proceeded downwards under the eastern horizon, *i.e.* according to the order in which the phenomena of each successive house would appear above that horizon, the due east point fell exactly in the middle of the first house, the due west point in that of the seventh, the meridian in that of the



tenth, and the opposite meridian in that of the fourth. All primitive astronomical and astrological study of the sky was occupied, and indeed necessarily occupied, with the rising, culmination and setting of the heavenly bodies, with the passage of planets, normal stars, and constellations from one house to another, and with the mutual positions of the planets as measured by the houses they happened to occupy at any given time.

It would appear that these houses were sometimes divided in two, as, *e.g.*, in Egypt in the time of King Seti; and this led quite naturally to the division of the day into 24 hours, and eventually to the arrangement of the dial-plate of our clocks. For more exact observations, however, each house was subdivided into three decanates, and each decanate into ten degrees, the advantage of this being that the sphere of the observer had the same number of parts as the ecliptic, while the boundary lines defining the parts of each coincided every four minutes.

This method of parcelling out the sun's apparent daily course must have been instituted at a very remote period, in an age indeed when the astronomer had not yet grasped the idea of a circular orbit, but still thought of the solar path as a square. In



the figure representing the horoscope this quadrate form was retained, and it has remained in use till modern times, and, in fact, till the present day. To this method of delineating the stellar paths in

the horoscope by means of the square we shall frequently have occasion to return, as a considerable number of symbols relating to God and the world were evolved therefrom. In interpreting the horoscope the various positions were so far as possible brought into relation with the first house, and with the latter as starting-point the astrologer, applying the principle of even and odd as in the case of the exterior planets, Sun, Mars, Jupiter, and Saturn, alternately assigned to the other houses an essential character of benefit or bane. Thus the twelfth house was unfavourable, the eleventh favourable, the tenth — apart from its special position—unfavourable, the ninth favourable, the eighth supremely unfavourable, and so with the rest. This mode of interpretation was also arrived at along another line of thought, and, being thus supported by two ostensible proofs, it was believed to be established beyond dispute. The second proof in question was that supplied by the 'aspects,' of which we shall treat presently.

The plan of indicating position by means of zodiacal signs and houses could at best give approximate results. For the sake of simplicity it was assumed that the boundary lines of the several signs always coincided with those of the several houses, and that accordingly at the end of a Babylonian double-hour each sign moved instantaneously into another house, whose number was one less than that of the house which it had vacated. For all further deductions within the limits of plane geometry, the entire contents of any particular zodiacal sign were regarded as concentrated in the middle point of the sign and the house then congruent therewith.

The enumeration of the astrological houses from the east downwards towards the west, then eastwards again above the horizon, so that account is first of all taken of the invisible regions of the stellar heavens, had its origin in the fact that the attention of the astrologer was primarily directed towards the rising of the stars, and accordingly the houses were numbered in the order in which the stars contained in them at any given time would reach the eastern horizon and become visible.

4. Aspects. — The term 'aspects' was used in astrology to denote the relative positions of the houses and zodiacal signs, or of the stars situated in the houses at any given time. Planets in the same sign and the same house were said to be in conjunction; planets in opposite signs and houses, in opposition. The other possible relations amongst the celestial phenomena were defined with reference to regular inscribed polygons. Thus, if a planet were situated in the twelfth or the second house, then the line joining the middle point of either of these houses and that of the first house would form one side of a regular inscribed dodecagon; in

which case the planet in question was said to be in dodecagonal aspect to the east point, or 'horoscope' in the original sense. As in the same way planets in the eleventh and third houses furnished the side of a regular hexagon, their aspect towards the east or the horoscope was spoken of as sextile. Similarly planets in the tenth and fourth houses were in quartile or square, and those in the ninth and fifth were in trine. The line joining the middle point of the eighth or the sixth house with the east point was not a constituent part of any regular figure within the circle, and suggested at best a cross dodecagon, formed thus, which was regarded as the violation of all order. But as conjunction and opposition were reckoned amongst the regular aspects, the eighth was the only visible house having no aspect towards the horoscope. The principle of alternate numeration likewise pronounced this house unfavourable. In the astrological application of spherical astronomy it therefore signified the house of death.

Prior to the stage now reached, the exclusive concern of the astronomer had been to map out the heavens with such precision as would enable him to fix his observations by means of a verbal record. His conception of aspects, however, *i.e.* of the relations of the stellar positions to the horoscope, led him to assign values to the stellar positions themselves, and as soon as these came to be represented as anthropocentric or concentric, the initiative was given to the science of Judicial Astrology. Nevertheless we must emphasize the fact that the original scheme of the horoscope was depicted as a square, and that, before it became possible for astrology to speak of regular polygons, the conception of the sun's apparent diurnal motion as a circle must have come to the front. Thus the very language of astrology shows it to have been a kind of excrescence, not inherently connected with astronomy at all. Even in the Middle Ages a distinction was still maintained between Natural Astrology and Positive Astrology. The former dealt with the actual, and especially the baneful, influence of the planets upon meteorological changes—wind, storm, hurricane, thunder, flood, and earthquake. It was accordingly bound up with the naive and fantastic weather-lore of primitive man, and is to some extent still in evidence in scientific meteorology. In regard to the latter it is even yet frequently true that *sub iudice lis est*.

Positive or Judicial Astrology, on the other hand, was concerned from the earliest times with the supposed influences of the planets upon the fortunes of men and nations. It is now regarded by all sober minds as an extravagance of the human intellect, as something that the race has finally left behind. In Judicial Astrology it was no longer merely the aspect of a star to the horoscope, *i.e.* the east point, that was specified and appraised, but also the aspect of two planets with respect to each other. If one planet, for example, was situated in the eleventh house and another in the eighth, the two were said to be mutually in quartile. Here again, moreover, we find the alternate distribution of good and evil: conjunction was good; adjacent aspect or aspect in dodecagon was evil; sextile was good; quartile relatively evil; trine specially good; absence of regular aspect was specially evil, and opposition relatively good.

Since the line between the eighth or the sixth house and the east point did not form the side of a regular inscribed polygon, these two houses were deemed of inferior value. For the anthropocentric mind of the astrologer it was therefore a short step to regard them as houses of misfortune. The eighth house thus became the house of death, and the sixth the house of pains. We shall see later that in the reciprocal relations between the macrocosm and the microcosm the left arm became a synonym for the house of death and the left leg for the house of pains, and that in consequence these bodily parts themselves came to be regarded as of evil omen.

As emphasis was laid likewise upon the mutual correspondence of east and west—an idea that was corroborated by the principle of alternate numbering—the twelfth and second houses were counted

unfavourable. In primitive plane geometry the inscribed triangle and hexagon were deemed preeminently regular figures, and once more the alternate enumeration gave the same result. Consequently the eleventh, ninth, fifth, and third houses were reckoned favourable; while the tenth and fourth, again, were relatively evil. These symbolical interpretations, however, were sometimes set aside, sometimes even reversed, especially those connected with the invisible half of the sky.

The tenth house, as that in which the stars culminated, was supposed, by a very natural symbolism, to preside over dignities and offices, while the fourth house, lying directly beneath us, came in similar fashion to be associated with parents and ancestors, as those who had passed into the under world, and inferentially with all the other ties of kinship. On the ground of a certain analogy with the eighth house, *i.e.* that of death, the twelfth became the house of enmity (*κακοδαίμων*), and, by a further analogy, the second became the house of poverty. As the second house, however, was situated in the sky belonging to the under world and therefore opposite to ours, it became the house of fortune and riches, and for the same reason the sixth house, that of pains (or, according to another interpretation, that of service), became the house of health. Next to the house of death came the ninth as the house of the tutelary deity, while the eleventh, adjacent to the house of enmity, became that of friendship (*ἀγαθοδαίμων*). On the ground of similar considerations the third became the house of brothers, and the fifth the house of children. Finally, as the first house was specially associated with the querent of the astrological oracle, the seventh belonged to the querent's counterpart, *i.e.* in the ordinary course of things, wife or husband.

The designations of the various houses were therefore as follows: (1) life, (2) riches, (3) brothers, (4) parents, (5) children, (6) health, (7) marriage, (8) death, (9) religion, (10) dignities, (11) friendship, and (12) enmity. But this arrangement gave only the general scheme of astrological prognostication, and in the course of thousands of years various changes were introduced. Our information regarding any particular era of astrological speculation is defective, and we speak only in a general sense when we assert that from first to last the system detailed above remained essentially unchanged. It was all along recognized, moreover, that the scheme must be specially adjusted to special circumstances. Thus in the case of sickness the real querent was the invalid himself, and it was about him, therefore, that the first house supplied information. The counterpart was meanwhile not the wife, but the disease itself, upon which accordingly light was cast by the seventh house. The tenth house, in which the stars culminated over the patient, symbolized the physician, while the fourth, lying directly beneath in the under world, signified medicine. Account was also taken, of course, of the eighth house as the house of death, and of the sixth as the house of health. The houses of friendship, enmity, riches, brothers, and children were not supposed to wield any influence upon the course of the disease. Nor was much importance attached, in such cases, to the symbolism of the sun's planetary family; and, in fact, according to Greek accounts of Egyptian astrology, neither Venus nor Mercury was taken into consideration at all.

5. The astrological conception of the world.—The enormous advances that have been made within modern times in the study and practical application of the natural sciences, as well as the great contrast that obtains between the ancient and the modern scientific point of view, are matters of common knowledge. It is impossible to understand the theories of nature held by the ancients without a clear conception of the difference between their fundamental standpoint and our own. According to the older view of the world, which can be traced backwards for 5000 years before Christ, and which still held unquestioned sway for 1000 years after Christ, all natural objects issued in parallel lines from certain primary causes of universal operation. Modern science, on the other hand, assumes that the various groups of physical phenomena proceed by differentiation from certain primordial forms. While the ancients, therefore, looked upon the diversity of things as original, and their common elements as due to external influences, the moderns assume that the properties which objects have in common are inherited from a single primary form, and that their differences have been produced by external conditions, such as, *e.g.*, the struggle for existence.

The two conceptions, however, are not held stringently apart, nor does history show a rigid line of demarcation between the later and the earlier. Even in Genesis ($10^{1\text{ff.}}$), for instance, we have a table of nations which stands in complete agreement with the modern point of view, more particularly in the circumstance that it traces back the ancestry of all mankind in a series of converging lines. Much more in accordance with the ancient conception, on the other hand, is the Greek Deluge-story of Deucalion, according to which human beings were generated spontaneously from stones acted upon by the formative powers present in the air.

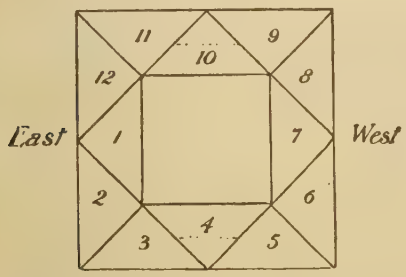
The theory of parallel processes may be called the 'ancient astrological,' or, again, the 'Oriental astrological' view of the universe. It had its birth amongst the early civilizations of the East, and its leading science was astrology; nor is it yet a spent force among certain Asiatic peoples of to-day. Now even our modern science, with its discovery of steam-power and its remarkable utilization of electricity, does not enter so profoundly into contemporary experience as did the ancient astrological conception into the life, thought, and feeling of the distant past.

Perhaps the most effective resistance to the more harmful issues of the astrological theory of the universe was made by the peoples living around the Mediterranean. But the Scriptures of the Old and New Testaments are likewise free from the evil outgrowths of that view. Nevertheless, we must remember that even the Biblical writers were children of their time, and could therefore hardly avoid expressing their thoughts in terms of the recognized philosophy of their age. Hence, just as we have come to recognize that the thoroughgoing study of Biblical Hebrew cannot dispense with the philological investigation of Arabic, Ethiopic, Babylonian, Syriac, etc., so we are now beginning to realize the impossibility of understanding the tenor of Biblical modes of expression apart from a knowledge of the astrological conception of the world common to the Babylonian, the Egyptian, and other ancient civilizations.

We must again refer to the square form of the horoscope, as furnishing the ground-plan of this theory of the world. The figure shows us the link which the theory had with astrology, and also with other two occult sciences, viz. Alchemy and the Kabbala.

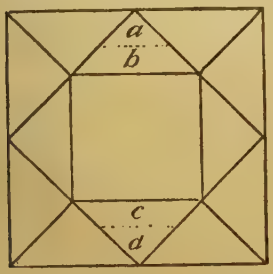
It is of interest to note that the symbols used in astrology for the four cardinal points were simply the triangles corresponding to the first, fourth, seventh, and tenth houses respectively. But while, according to the expedient already noticed (p. 52[a]), the positions of the stars in the ecliptic were determined by the observer on the north, the fixing of the cardinal points was effected by his fellow on the south. The horoscope was therefore seen by the latter from the opposite point of view, and the

four houses in question took a reverse form, so that △ came to mean north, ▽ south, ▷ east, and ◁ west. With this exception, however, all further inferences were drawn from the proper form of the horoscope, *i.e.* from the figure it presented to the observer on the north.



The tenth house, as the *summum cœlum*, and the fourth, as the *imum cœlum*, embraced everything in the world above and the world below respectively. The upper world as a whole, however, consists of the eighth, ninth, tenth, eleventh, and twelfth houses. In the hieroglyphic script of Egypt, accordingly, heaven is represented by the exterior boundary of these five houses, thus: , which, of course, according to the Egyptian practice in such matters, is only a contour, and really stands for . The same proportions and angles are likewise retained in the Egyptian representation of the goddess of heaven, who broods over the earth-god—a phenomenon which will meet us again when we treat of Egypt. The under world was represented, of course, by the same figure inverted. Now we find two different ideas attaching to each of the houses numbered ten and four. According to one conception the *summum cœlum* contains the heavenly upper ocean, from which rain falls (אַרְבֻּת מַשְׁקִים in the Biblical narrative of the Deluge), while the *imum cœlum* embraces both the ocean of the under world and the subterranean water from which the fountains of the deep are fed (מַעְיְנוֹת תְּהוֹם; also the sources of the Nile in Herodotus). According to the other conception there lies above us first of all air, then fire; and beneath us, first earth, then water.

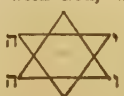
Now the latter theory furnished also the alche-



a = Fire △
b = Air ▲
c = Earth ▽
d = Water ▽

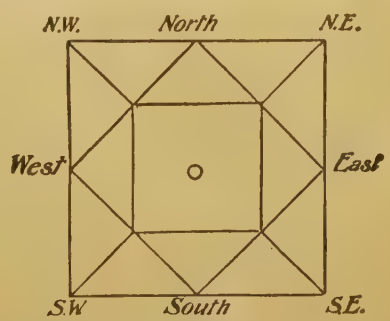
mistic symbols of the elements—symbols which are still written by doctors in old-fashioned mysterious receipts, and were in common use among physicians and apothecaries a hundred years ago. Thus, for example, ▽*sigill.* signified *terra sigillata*; *lumbric.* ▽*restr.* = *lumbrici terrestres*; ▽*flor.* ⊙*rant.* = *aqua florum aurantiorum*; or something was to be boiled *leni* △, *i.e.* *leni calore*. Distilled alcoholic liquors were known as 'burnt water,' and were denoted by a combination of the symbols for water and fire, thus  . To this day the device displayed upon rustic inns indicates the licence to sell brandy.

This combined symbol was used not only in alchemy but also in the Kabbala, where it represented the Star of David. It became, in fact, a symbol for God (just as the fire-eye, *i.e.* , was employed in Christian symbolism to signify the Holy Spirit); for, by the rules of the Kabbala, the combination of the principal consonants of אֵשׁ ('fire') and מַיִם ('water') yielded the word שָׁמַיִם ('heaven'), which in its turn was the cabalistic equivalent of אֱלֹהִים ('God'). Thus the term God could be expressed by the secret sign as the synthesis of fire and water. In the synagogue all pictorial representation of God was forbidden, nor was it allowable to give utterance to the tetragram יהוה unless absolutely necessary. In the same way, therefore, as the word אדוני had to be resorted to as the oral designation of God, the symbol came to be used in the architecture of the synagogue as His graphic designation. This figure, moreover, not only contains within itself the symbols of the four elements, interlaced with one another, but, besides the upper and lower triangles signifying fire and water respectively, it also shows four extra-mundane triangles, which could thus be regarded on cabalistic principles as metaphysically symbolizing the four consonants of the tetragram. Hence, even in passages of ancient Christian works where we might expect some such phrase as 'with God,' we actually find the cabalistic device



signifying יהוה.

According to the astrological theory of the world, however, not only the perpendicular section through the universe, but the surface of the earth itself, was thought of as quadrate, since the cube, as the ideal geometrical figure, was the accepted symbol of the world as a whole. This idea finds



frequent expression even in later cabalistic writings treating of the origin of salt, which, of course, also crystallizes in cubes. The scheme of the horoscope, accordingly, became a comprehensive map of the world as well. As previously explained in

connexion with the points of the compass, the horoscope was in this case constructed, as it were, from the opposite point of view. In the centre was the navel of the world, which every nation sought to claim for its own territory, and as the site of the national sanctuary. The figure also supplied the four pillars, viz. N.E., N.W., S.E., and S.W., upon which the heavens are supported. Of these the best known was the S.W. pillar, as it was there that Atlas had been relieved by Hercules.

6. **Anthropomorphic nomenclature of the sphere.**—The square horoscope was not the only expedient resorted to in setting forth the relations of the stars, as another method was also in use among the Egyptians. From a time anterior to Menes until the final period, the high priest of Heliopolis was known as  , *i.e.* 'chief astrologer.' We may note in passing that this office was held by Poti-phera (of which name the literal Greek translation was Heliodoros), the father-in-law of Joseph (Gn 41[45]). Tables of observations made in Egypt during the Twentieth Dynasty are still extant, and in these are recorded the times at which the fixed stars cross the middle lines of the houses, *i.e.* the beginnings of the double-hours. The astrologer on the north found the meridian of the place of observation by looking through the slit of the palm-leaf rib above the bald crown of his companion. The middle meridians of the first and seventh houses were given by the horizontal line, while the observer found those of the eleventh and ninth houses by lines projected over his companion's right and left eyes respectively, and in similar fashion those of the twelfth and eighth houses by lines above the right and left elbows. It is probable that the sixth house was in like manner associated with the left knee, and the second house with the right.

From this point of view the left arm corresponded with the house of death and the left leg with the house of sorrows, and on this account there eventually arose a superstitious aversion to using the word 'left' at all. In particular, all actions performed by the left hand came to be regarded as unlucky. It may well be the case that mankind was right-handed rather than left-handed before astrology asserted its sway, but the ban thus laid upon the left extremities of the body undoubtedly supplied a further reason for excluding the left side and especially the left hand from all actions of great and critical moment.

7. **Applied astronomy and astrology.**—Alike in the greatest and in the smallest affairs of life uncivilized man is affected by the changes incident to the day and the season, by the phases of the moon by night, and by the ebb and flow of the tides. Hence the observation of sun and moon with a view to a standard measurement of time, or, in other words, to the construction of a calendar, was a vital condition of all progress in civilization. But, as the periods of the earth's rotation about its axis (*i.e.* the apparent diurnal movement of the sun), of the moon's revolution, and of the sun's apparent annual revolution, are incommensurable with regard to each other, the early attempts to frame a serviceable calendar were attended with no small difficulty. As the lunar month made more impression upon the primitive mind than the actual solar year, endeavours were made in the earliest calendars to base the latter upon an integral number of the former, and all sorts of expedients were tried in order to harmonize the two periods. At a further stage in the growth of civilization the determination of the true solar year became the subject of inquiry, the length of the true lunar month being then left out of consideration. Here again, however, the residual fraction of days provided difficulties, and the difference between the calendars of Western Europe and Eastern Europe (Russia) shows that these difficulties have not yet been overcome. In the pre-Christian era there was a disparity between Babylon, with its cyclically adjusted lunar year, and Egypt, with its solar year, or, rather, its two unequal solar years. Other civilizations employed other types of calendar. A purely lunar calendar is still in use among Muhammadans.

The outstanding periodic phenomena of the apparent courses of sun and moon were registered in these calendars, and were celebrated as occasions of joy or sorrow according to their influence upon human life. In such feasts and fasts the moon and the sun were, first of all, personified, and they still continued to be revered as divine or heroic beings even after the particular days connected with their movements by astrology and astronomy had been duly set down in the artificially corrected and adjusted calendars of ancient and modern civilized peoples.

8. **Lunar, solar, and planetary deities.**—The ascertainment of such varying influences of the moon and the sun as could be registered in the calendar was undoubtedly a forward step in the mental development of primitive man. But the notion that the movements of moon, sun, and planets were effected by powerful and conscious beings, more or less endowed with free will, was an open door to all illusion. The religion and mythology of the lowest races are permeated with this idea. Amongst more highly civilized peoples, again, we find a stock of myths of like purport, which, partly indigenous and partly exotic, forms a kind of illicit religion or superstition, and which shows many points of contrast with the teachings of the recognized national cult. In periods distinguished by a high state of civilization this supplementary religion finds acceptance only amongst the lowest and least enlightened ranks of the people, while at times, when culture is at a low ebb, it extends its sway over the leading classes as well.

In cases, however, where a relatively advanced and purified form of religion found its way into a region already civilized, the old representations of moon and sun as personal beings, as also the narratives that had grafted themselves upon their festivals, degenerated into mere legends. As illustrations of the process we may name the *Metamorphoses* of Ovid in the Roman religion, the stories of the Thousand and One Nights in Islām, and Grimm's domestic and popular tales in Christianized Germany.

But it was also possible that a fusion might take place between the older and the newer narratives. Thus, apart from the sphere of religious history as such, there are many mediæval kings and heroes whose actual experiences, on the one hand, stand forth in the clear light of history, but whose legendary adventures, on the other, show unmistakable deposits from the personifying narratives about the moon and the sun. The same process has been at work practically everywhere; we trace it not only in the *Nibelungenlied* and the *Iliad*, but also in connexion with all the great figures who as gods or prophets occupy the supreme place in the various systems of religion. Popular imagination, in fact, clinging as it does to the ancient legends, is quite indifferent as to the figure around which it throws them; it may fix upon Confucius, Buddha, Zarathushtra, Jesus, or Muhammad. Even the older religions, with deities unmistakably of planetary origin—the Babylonian

Shamash, the Egyptian Rê, the Greek Apollo—show such secondary deposits from various astro-mythological sources.

The disengagement of this secondary astro-mythological element from the Christian system of thought has now become one of the prime tasks of theological criticism. It is no longer possible for any earnest scholar to reject the fundamental idea of such analysis, and the extent to which the work of elimination shall be pursued depends entirely upon whether the individual theologian leans towards the more orthodox or the more liberal side. In regard to Confucius, Buddha, Zarathushtra, and Muhammad, as also in regard to the Alexander romances, the Christian theologian concedes the rights of the method without hesitation. Further, the OT and the Life of Jesus have from ancient times been the nuclei of a mass of legendary stories (the Talmud, etc.; Gospels of the Infancy, etc.), which all theologians have for centuries regarded as apocryphal; and it cannot be disputed that the study of astro-mythology has rendered valuable service in throwing light upon the origin of these spurious additions to the lives of the leading personalities of our religion. Once more, there is a group of writings which, though reckoned apocryphal by evangelical Churches, are still included in the Roman Catholic canon; and, as might be expected, the bearing of the astro-mythological theory upon these writings is estimated by the two great parties within Christianity in precisely opposite ways. And when at length the theory is applied to certain constitutive elements in the OT, and to the life of Jesus as given in the evangelical records, the theologians who concede its rights in these domains are fewer still in number. The explanation of this, of course, is that such criticism seems to undermine the historicity of the Biblical narratives, and to leave nothing but a mass of mythical stories about the planets, which have crystallized around certain more or less unreal figures in the history of Israel. The logical result of the process appears to be the subversion of every constituent of Christianity save its ethics.

Taken in this sense, the comparative study of astrology and astro-mythology rests upon an impregnable foundation. The implications of its results, as was said above, may quite well be brought into harmony alike with the most rigid orthodoxy and the broadest liberalism. Hence it cannot be non-suited by either of the warring schools; it is reconcilable even with the aims of its critics. Just as comparative philology is an ideal and impartial science, so must the comparative study of myths assume a like impartiality; and the indispensable framework of this study is formed by the planetary deities of astrology.

9. Prophetic astrology.—From the theological point of view, prophetic astrology must be regarded as a by-way towards superstition, and, indeed, as one of the main sources of superstition. It was evolved by gentle gradations from what we may call 'calendar astronomy.' Primitive man discerned parallelism not only in the processes of nature, but also in the State and in human life; nay, even in the forms and organs of animals he read analogies and homologies, and many other fields of observation presented similar correspondences. But by far the most obvious and unmistakable cases of parallelism were those which subsisted between the motions of the sun and the moon, on the one hand, and the periodic variation of the tides, of light and heat during the day, and of the seasons, on the other. Hence arose the notion of planetary deities or angels—beings who acted according to highly complicated laws, ordained either by themselves or by a superior power, and who sought to bring all events, great and small alike, within the range of parallel uniformities. Where the trend of thought was polytheistic, the planets were regarded as gods; where it lay towards monotheism, they were but the messengers of a Divine will beyond them; or, as the case might be, an inevitable fate was supposed to hang over the gods themselves.

From the standpoint of the ancient astrologer, the supreme function of all learning was the observation of certain simple phenomena and the drawing of inferences bearing upon a parallel series of facts otherwise veiled. The primary task of astrology was to ascertain the positions of the planets in relation to one another, to the zodiacal signs, and to the observer himself, and then to make deductions therefrom. This was astrology properly so called, and it required for every particular case a direct reading of the sky. A cloudy night, however, rendered such direct readings impossible. Now, the Kouyunjik inscriptions, dating from the time of the Assyrian king Assurbanipal, yield evidences for a continuous series of actual observations. From these we learn that, notwithstanding the complexity of the planetary movements, the periodic repetition of essential phenomena had been calculated for each particular planet. Thus the astrologer could fall back upon tabulated records covering every particular sequence of planetary movement, and could substitute these for direct observation. It is true that, owing to trifling inaccuracies in the data thus supplied, this course was avoided for thousands of years; but at length the momentous step was taken. No doubt, it still remained necessary to bring certain recorded positions to the test of actual observation; but, with these exceptions, the researches of the practical astrologer were thenceforth pursued in the study. Our earliest evidences for this procedure date from the period of the Persian monarchy.

So far as astronomy itself is concerned, this was a progressive movement; but, from the standpoint of observational science, it was a backward step. It issued finally in the determination and mathematical calculation of the planetary orbits by Kepler. But, in our estimate of Kepler's discoveries, we must always bear in mind that he was still under the spell of the astrological conception of the universe. It was his firm belief that his discoveries supplied the key to all events of history, and had exalted astrology to the level of a perfect and independent science of simple calculation, while in reality he had given the death-blow to its pretensions.

From the time of the earliest attempts to draw up a calendar—through the period of the Sumerians and Akkadians—to the days of Kepler astrology underwent no essential change, save that it gradually abandoned the method of direct observation of the heavens in favour of, first, a partial use of tables containing earlier observations, and, finally, a purely arithmetical determination of the positions occupied by the planets at any given time. Astrology, be it remembered, was a study of international importance. Wherever, therefore, in the history of any civilized country we can trace some slight advance in astronomical science, we find corresponding records, practically contemporaneous, in all the civilized countries of that epoch. Additions to men's knowledge of the stars were valued only as ancillary to the determination of the planetary positions. As all the available evidence goes to show, however, astrology, throughout its entire career, had but one method of adapting this knowledge to oracular ends—the method, namely, of symbolical interpretation, with a more or less clearly realized principle of alternation. In the main, the positions of the planets were made

the basis of prognostications of the unborn future, but they were also used as a means of filling up *lacunæ* in the knowledge of the past and the present.

10. **Astrology and medicine.**—In the ancient Oriental view of the world, astrology, religion, and therapeutics went hand in hand. In the conviction that all things in the universe proceeded in parallel lines, men spoke of a macrocosm (primarily the stellar world as the province of Deity) and a microcosm (primarily the human body), and sought for far-reaching analogies between them. Thus—to take one of many examples found in Sanskrit literature—the Vedas and their allied texts exhibit attempts to establish an exact equivalence between the number of the bones in the human body and that of the days in a year. Simple as would have been the task of enumerating the bones accurately, they were purposely numbered wrongly, so that the desired numerical relations might be educed; the lower jaw, for instance, was said to be composed of eighteen single pieces, not including the teeth, just because this number, while purely factitious, could, as the twentieth part of 360, be used for purposes of speculation. The method was applied in every field, and things which did not harmonize in fact were arbitrarily made to do so.

In the ancient East the therapeutic art was based upon the two fundamental postulates of air in motion and liquid in motion, and it was supposed that in the human body the air passed along the arteries, while the liquid traversed the veins. The solid substance of the body (its earthy constituents) and its native heat (its igneous constituents) were regarded as forming a fixed and constant mass: earth and fire, in fact, were probably never considered in their physiological aspects until the Hellenistic period. The astrological references hitherto discovered in Babylonian and Egyptian texts show that air and liquid alone were taken into account. In the further development of these notions, special prominence was given to the air by the pneumatists, and to the blood (*i.e.* liquid, and a mixture of the four principal humours, viz. water, phlegm, yellow bile, and black bile) by the hæmatists. We cannot enter here into the particulars of the antagonism maintained between the two schools for several thousand years, an antagonism which we can trace in the period when the Pyramids were built, and which, again, moved the hæmatist Aristophanes to the mortal hatred wherewith in the *Clouds* he arraigned the pneumatism of Socrates before the Athenian populace. Suffice it to say that, in all references to the facts of nature found in the Pentateuch, the Jahwistic sections (of Genesis in particular) represent the pneumatic, and the Elohistic portions the hæmatic, point of view, whereas the Priestly Code exhibits no scientific tendency at all. The pneumatists regarded the nose as the most important organ of the body. We may recall the numerous phrases formed with אַף in the OT, and the large noses of the singers in the chorus of the *Clouds*. Even amongst the inscriptions from Nineveh, which must, on the whole, be reckoned to the hæmatic school, the present writer has found no fewer than fourteen different texts referring to divination by the nose.

According to the hæmatist, life was concentrated in the liver, the כָּבֵד, or heavy organ, which, accordingly, together with the blood, plays a prominent part in the OT and the Talmud. Among the Babylonians and Etruscans, again, as also among the various peoples influenced by them, haruspicy took the special form of divination by inspection of the liver. The cuneiform texts which treat of this hepatoscopy are without number, and have been read and translated mainly by Jastrow. In the ancient East, and even in Greece, the hæmatists were for the most part firm believers in astrology, omens, and all that we now brand with the name of superstition. To dreams, above all, they attached great importance, while the pneumatists, on the other hand, as is shown by the writings of Hippocrates, declared dreams to be unworthy of consideration. The pneumatists seem to have borne the reputation of being enlightened persons, or sometimes even atheists, as was the case with the pneumatist Socrates as delineated by Aristophanes. From certain fragmentary indications we may perhaps gather that in the main the Christians of the early centuries were pneumatists in their knowledge of nature.

From the mental standpoint of the hæmatic astrologer every actual group of relations amongst the planets mirrored itself in all synchronistic events and conditions, and thus the entire horoscope would be reproduced in the variations and peculiarities found in the liver—the central organ—of the newly-born sacrificial animal. An expert examination of the liver could therefore quite well take the place of a direct observation of the sky. The practice of hepatoscopy was extensively diffused, and diagrams illustrative of the art are still extant. The method adopted by the Babylonians was to portion out the liver in what may be called oracular squares by means of a right-angled system of ordinates, a device reminding us of the square sections shown by the extant Egyptian projection of the heavens made in the time of King Seti, and likewise of the square figure used as the ground-plan of the normal horoscope. Among the Etruscans, however, hepatoscopy employed a polar projection in its construction of oracular fields, and to this arrangement corresponds the system of regular polygons designed to represent the relative positions of the planets in the circular horoscope.

Another way of dispensing with direct observation of the heavens was to watch the forms assumed by certain substances when suddenly placed under new conditions, as it was supposed that the forms thus produced were determined by the configuration of the planets at the time. Oil or melted tallow was dropped into water, or water into oil, and the diviner took note of the resultant forms. We possess two comprehensive lists drawn up in the reign of King Ḥammurabi of Babylon for the express purpose of interpreting these formations. This mode of divination still survives in the superstitious practice of dropping molten lead upon a cold surface.

A further variety of oracle was found in dreams, to which reference has already been made. Dreams also were believed to run parallel to the facts of astrology, and might, therefore, be substituted for the latter. But, as dreams were held to have their origin in the blood, their significance was conceded by the hæmatists only.

Finally, every unaccountable phenomenon of nature—from the movement of an animal to a monstrous birth—everything, in short, that touched human life at any point, came to be associated with planetary influence, and might become the basis of divination. The library of Sardanapalus contains thousands of tablets in which such superstitious ideas and practices are expounded with the most precise casuistry. They seem to have been regarded as the supreme and final expression of wisdom, and might relate to matters a thousand years old. But these fallacious issues of man's search for knowledge, involving such a prodigal expenditure of energy in collecting data, find their ultimate explanation in the fundamental misconception of astrology, viz. that the incidents of life, being dependent upon the contemporaneous con-

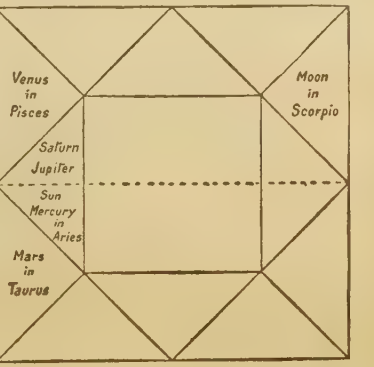
figuration of the planets, must exhibit a parallel order in their occurrence, and that accordingly valid inferences regarding either of the parallel series may be drawn from the other. The underlying conception of the whole procedure, however, was that of the astrologer, and hence we find that in the system of divination by bowls which was practised in the time of Ḫammurabi, the instantaneous formations of dropped grease were regarded as yielding actual knowledge of the planetary deities.

11. Subsidiary tables.—The various substitutes for astrological diagnosis might become, and, indeed, necessarily became, very important, as it was often difficult to determine the requisite facts concerning the planets. We must remember that the problem usually set before the astrologer was to draw the horoscope of the birth or conception of an individual at a time when years had elapsed since these events, and by this means to forecast the future. His task was, in short, to re-construct the astrological conditions of a past event, and he had in consequence to refer to tables or lists of earlier astronomical observations. As regards the sun and the moon, the information he required was furnished by the calendar, but special lists were necessary for the five smaller planets. An extensive table of this kind, written in the Demotic character of Egyptian, and dating from the reign of Augustus, has been preserved. The Julian emperors, let us remember, used to settle their retired soldiers in Egypt. Colonies of veterans thus established in the Fayum would be largely drawn from those who had been born in the reign of Augustus. It was therefore necessary that the astrologer who practised his art in this province should possess lists of the successive positions of the planets during that reign. The example before us is but the transcript of a transcript: whole lines are wanting, and figures have been misread. We may thus infer that such lists were produced in great profusion to meet the needs of astrologers in the various districts and villages. In order to make the proper entries in the horoscope required, the astrologer needed simply to know the zodiacal signs in which the several planets were situated at the time, and accordingly the information supplied by the astrological lists regarding any particular planet was confined to the day of the month on which it entered a new sign. The ancient lists of ephemerides were thus neither more nor less than astrological tables.

For predictions of a general kind the astrologer constructed 'nativities,' while for cases of sickness he drew horoscopes of the *κατάκλισις*, *i.e.* the inception of the disease, and otherwise adapted his art to special circumstances. He had to be informed of the day, month, and year of the critical event. The signs occupied by the smaller planets at the given date were then noted down from lists like that of the Berlin Papyrus 8279; the moon, together with the day indicating its age, was inserted in the proper sign according to the calendar of the lunar cycle, its lunar station being also fixed by established rules; the sun was placed according to the date. The next step was to arrange these particulars systematically in the twelve houses, the exact hour of the event, or, failing that, the time of sunrise, being used as the determining point. From this, again, the positions of the planets relative to one another, to the eastern point, and to the different zodiacal signs, were deduced and interpreted.

12. The horoscope of Jesus Christ.—As an illustration we shall take the horoscope of the conception of Jesus, according to the form in which we are able to re-construct it from the Demotic table of the planets in the Berlin P. 8279. The dates given are themselves products of astrological speculation, and cannot be regarded as historically established, but they are nevertheless worthy of notice. On the 24th of June, B.C. 7 (or previously), took place the conception or birth of John the Baptist. On the 15th of April, B.C. 6, 5 a.m., the annunciation to Mary (instead of the conception of Jesus), and, at the same time, the observation of this 'nativity' by the Magi. Between the 24th of June, B.C. 6, and the 25th of November, B.C. 6, occurs the visit of the Magi to King Herod. After the 25th of November, B.C. 6, the Magi notice the re-appearance of the stellar configuration at the annunciation. On the 27th of December, B.C. 6, the stellar configuration becomes stationary (*ἀστὴρ ἔστη*), and the Magi worship the infant at Bethlehem.

Now the horoscope of the 15th of April, B.C. 6, can be re-constructed thus:



and supplies the following apotelesmata capable of interpretation:

(1) The horoscope of the day appears (with sunrise). (2) Aries is in the ascendant. (3) Mars, as lord of the house of Aries, presides over the birth. (4) The sun is in the ascendant. (5) Saturn in the ascendant. (6) Jupiter in the ascendant. (7) Mercury in the ascendant. (8) Saturn in the ascendant, and above the horizon. (9) Saturn is intercepted between the favourable planets Venus and Jupiter. (10) Mars in the second house. (11) The moon enters the eighth house. (12) Venus is in the twelfth house. (13) Mercury in the house of Mars, and likewise in immediate proximity to Mars. (14) Saturn is in his *ταπείνωμα*, or 'detriment.' (15) The sun in his *ὕψωμα*, or 'exaltation.' (16) The moon in her *ταπείνωμα*. (17) Venus in her *ὕψωμα*. (18) Venus is *matutina* (morning star). (19) Jupiter is in proximity to his house Pisces. (20) Jupiter in trine (*adspectus trigonalis*) with his house Sagittarius. (21) The sun in trine with his house Leo. (22) Saturn's motion is direct. (23) Jupiter is direct. (24) Mars is direct. (25) Venus is retrograde. (26) Mercury is direct. (27) Mercury is combust. (28) Mercury in immediate proximity to the sun. (29) Mercury is invisible. (30) Mars is not combust. (31) Mars is nevertheless invisible, and is, in fact, entering upon its invisible period of three months. (32) Mars is separated from the sun by Mercury. (33) Saturn is separated from the sun by Jupiter, though the latter is combust. (34) Jupiter is combust. (35) Jupiter is separated from the sun by small planets. (36) All the morning stars are visible. (37) All the evening stars are invisible. (38) Mars is situated in his nocturnal triangle. (39) The terrestrial triangle contains Mars only, its nocturnal lord, situated in Taurus. (40) Mars is in opposition to his house Scorpio. (41) The moon in trine with her house Cancer. (42) The moon is in her domain. (43) The trigonum of fire contains its lords conjoined in Aries. (44) The trigonum of water contains its diurnal lady Venus. (45) The trigonum of water contains its nocturnal ruler, the moon. (46) The moon and Venus are in trine. (47) The trigonum of air is empty. (48) Saturn and Jupiter are in conjunction. (49) This conjunction occurs in Aries, and is thus *conjunctio maxima*, and dominates the entire horoscope. (50) This *conjunctio maxima* was preceded by a *conjunctio magna*, occurring in Pisces (indicating the astrological necessity for the forerunner, John the Baptist). (51) Saturn is in conjunction with the sun (but cf. 33). (52) Saturn is in conjunction with Mercury. (53) Mars and Mercury are in different houses, but close together. (54) Saturn and Venus are in the same relation. (55) Jupiter is in conjunction with Mercury. (56) Venus is visible. (57) Saturn is visible. (58) Jupiter is visible. (59) Saturn has no aspect with the moon. (60) Saturn is in *adspectus confinis* with Venus. (61) Saturn is in *adspectus confinis* with Mars, but triply intercepted.

(62) Jupiter has no aspect with the moon. (63) Jupiter is in *adspectus confinis* with Venus, but intercepted by Saturn. (64) Jupiter is in *adspectus confinis* with Mars, but doubly intercepted. (65) The sun has no aspect with the moon. (66) The sun is in *adspectus confinis* with Venus, but doubly intercepted. (67) The sun is in *adspectus confinis* with Mars, but intercepted once. (68) Mercury has no aspect with the moon. (69) Mercury is in *adspectus confinis* with Venus, but triply intercepted. (70) Mercury is in *adspectus confinis* with Mars. (71) Mars is in opposition to the moon. (72) Mars is in trine aspect with Venus. (73) Full moon is just past. (74) No planets are in quartile with each other. (75) Of the tropical signs only Aries is occupied, but it contains four planets. (76) All the planets except the moon are clustered near the sun. (77) All the planets except the moon and Venus are under the influence of the sun (Mars as lord of the sun's house). (78) Jupiter emerges from the sun's beams. (79) Hence the *conjunctio maxima* also emerges. (80) All the visible planets and the moon are situated in the diurnal sky. (81) All invisible planets are in the nocturnal sky. (82) The lord of Saturn's house is Mars. (83) The lord of Jupiter's house is Mars. (84) The lord of the sun's house is Mars. (85) The lord of Mercury's house is Mars. (86) The lord of Venus's house is Jupiter. (87) The lord of the moon's house is Mars. (88) The lord of the house of Mars is Venus. (89) The horoscope, *i.e.* Aries, is masculine. (90) The other occupied houses are feminine.

Several points of detail may be left out of account. By making the horoscope more precise, and dividing it into decanates and degrees, we might multiply indefinitely the ninety particulars given above. These data of the positions occupied by the planets were known as *apotelesmata*. The ninety *apotelesmata* enumerated here can be interpreted only in part at the present day, as our information regarding ancient modes of astrological interpretation is at best fragmentary. According to rules still extant, interpolations and adjustments, no doubt, have also been made in certain particulars. So far, however, as we can test the interpretations of this horoscope, it corresponds with the evangelical narratives of the life of Jesus even in its smallest details.

13. The development of astronomy and astrology among the various peoples.—The foregoing sketch makes it evident that primitive peoples constructed their calendars by direct observation of the heavens. Similarly, it is amongst these primitive peoples, as indeed we might expect, that we find the first steps of the transition from astronomy to astrology. Thus, in the interior of some of the larger South Sea Islands, as, *e.g.*, Borneo, a primitive astronomy and astrology are found amongst the aborigines, while the inhabitants of the sea board, as also of the smaller islands, exhibit a higher development in the science of the stars, partly because their nautical interests demanded a more thoroughgoing observation of the heavenly bodies, and partly because they were influenced by the higher standard of culture attained by the Asiatic races, as is shown, for example, by the fact that the Malay language contains words borrowed from Chinese, Sanskrit, Arabic, and Persian. Of the pictorial writing of ancient Mexico, part of the calendar is all that has hitherto been deciphered; but even this suffices to show striking correspondences between the civilizations of America anterior to its discovery by Columbus and those of the ancient Asiatic races, and not least in astronomy and astrology. The development of these sciences already attained in the Babylonian period or later in the time of Alexander the Great is practically the same as now prevails throughout China, in part of Japan, and, above all, in India.

In the West, likewise, the results of astronomical inquiry were still encumbered with the old superstitious conceptions. The earliest successful attempts to eliminate these conceptions and their effects from astronomy were made about A.D. 1500. It is true that at the zenith of Roman civilization the educated classes tried to throw the lumber of astrology overboard. Certain of the Church Fathers wrought strenuously to oust it from its place. But, on the one hand, the vexed question regarding the date of Easter, which was simply a consequence of combining the lunar calendar of Babylon with the solar calendar of Egypt, and, on the other, the attempt to fix a year for the birth of Christ, gave astrology once more a certain adventitious prestige in Christian life and theology. Fresh vantage ground was also won for it in the secular learning of the Middle Ages by the Western drift of Islām and the Jewish Kabbala. As a matter of fact, the astronomy of the West, and, in particular, the coalescence of astronomy and astrology in the later culture of Western lands, is a development or an importation from the astronomy and astrology of the ancient East.

Until the time of Kepler, astronomy was always bound up with astrology, and its progress was for the most part of a meagre kind. This may seem incredible so long as we confine our investigation to a short period abounding in records, but it is always unsafe to argue from the silence of the earlier records that the apparently fresh facts set forth in the later constitute an actual advance. No candid observer in the field of astrology could fail to notice that, while this or that forecast might happen to be correct, yet in many cases the configuration of the planets, however skilfully interpreted, could not be reconciled with the facts of experience. Certain details of astrological procedure were, therefore, constantly being left behind, as in an ever-seething witches' caldron; and, on the other hand, long disused methods were once more resorted to. This was especially the case when, in periods of unrest, races and civilizations were shaken and mingled together. Detailed research in a narrowly circumscribed period may thus produce the illusion of rapid development in a science which, in its leading features, really remained unchanged from age to age.

The fundamental tenets promulgated by astrology as inviolably true were manifold. From the fourth house, as it seemed, welled up the subsoil water and the springs which fed the rivers, while from the tenth house came the rain. Now when primitive man found the moon in either of those houses he anticipated a flood. But the moon was evidently connected also with the occurrence of menstruation, which was regarded as a periodic overflow of blood. The astrological explanations of these phenomena tended to corroborate one another so fully that the sovereignty of the moon over the liquid element was deemed indisputable. An example of a different kind is furnished by the horoscope of disease, or rather of the κατάκλισις. Here the invalid was the querent, and his malady the quesited, and information regarding them was supplied by the first and seventh houses respectively. Now, in the regular horoscope the sixth house was significant of pain and the eighth of death, and thus the entire western section of the sky from 45° above the horizon to 45° below it was the region of disease. In this expanse, however, the sun, distinguished among the planets as the source of heat, is situated between three and nine o'clock p.m., and this again is the time when the invalid shows symptoms of fever. An easy explanation was thus provided for the increase of febrile temperature, while on the other hand the validity of the science was demonstrated once more. Astrology simply abounded in spurious proofs of this type.

Thus the leading principles and ideas of astrology were looked upon for centuries as incontrovertible. Its failures were attributed to points of secondary moment, save in cases where it seemed more convenient to change the time premised by a whole double-hour, and so to shift the entire horoscope by one house—an artifice

which would in general quite invert the first interpretation. Corrections and alterations were thus made in matters of detail, while among the more progressive peoples the general tendency was towards over-refinement in interpretation and an ever-expanding casuistry.

Accordingly there was no real development in the astronomy and astrology of the ancient East within historic times. The extant evidences of the inscriptions go as far back as the period of Šargâni-šar-ali and Narâm-Sin. From the reign of the former eight short texts are all that have as yet been brought to light, and from that of the latter sixteen only, all of the same date. It is not to be expected, therefore, that we shall trace all the details of later astrology in such meagre records. It is surely sufficient for our purpose that the later period, the archives of which may quite well extend backwards to the monarchs just named, yields a mass of evidence to show that astronomy and astrology had by this time reached the status of a closed and rounded system. Inscriptions from the age of Ḫammurabi make it clear that full instructions had already been drawn up for the practice of divination by cups in connexion with planetary configurations. From a period about a thousand years before Christ come the inscribed boundary-stones, the dates of which are indicated by their arrangement of the planetary symbols. Thereafter the richest vein of astrological records is found in the library of Sardanapalus. We learn from these that there was a system of observatories covering the whole kingdom, that there was an established scheme of relays for the professional astrologers and of serial reports regarding their work, and that a State library had been established for the purpose of supplying all needed information in astrology and the auxiliary arts of divination. It is to be regretted that as yet only the *Reports* of the astrologers and the instructions regarding hepatoscopy have been properly edited. The cuneiform texts of the period between Sardanapalus and the beginning of the Christian era are not so rich in relevant information. The astronomical texts of this epoch, however, have found a thoroughly capable editor in Kugler, whose labours were based on the preparatory studies of Strassmaier and Epping, but who, unfortunately, engaged as he was with the productions of a relatively short period, has failed to grasp the subject in its entirety. A final residuum of Babylonian astrology was the perfunctory knowledge of 'the science of the Chaldæans' current in the days of the Roman Empire. From the beginning of our era astrology and astronomy languished on in the various Asiatic countries, but they were borne westwards by the Arabs. Mesopotamia always remained more or less of a *terra incognita* for countries influenced by Græco-Roman civilization.

On the other hand, Egypt became permanently merged in the Roman Empire, and, at a later period, in the Byzantine Empire. It was Egypt, therefore, that brought Babylonian astronomy and astrology into real contact with the West. Even in the most remote times, in a period, it may be, anterior to the First Dynasty, astrology, religion, and medicine were combined as one science at Heliopolis. The high priest of Heliopolis, officially invested with the star-spotted panther's skin, was all along the supreme State astrologer until the imperial age of Rome, and he bore the title of 'great in vision' already alluded to. A hierarch of this order is named in the Bible (Gn 41^{45}) as the father-in-law of Joseph—of that Joseph who was himself an interpreter of dreams ($40^{5ff.}$ etc.), and practised the art of divination by bowls ($44^{5.\ 15}$), referred to in connexion with Ḫammurabi. On the wall of a tomb dating from the reign of Seti I. we find lists of stars, times of culmination, etc. Extensive tables of ephemerides and a fragment of planetary divination according to the different houses, together with corresponding dream-tables, have survived from the age of Augustus. We possess even horoscope-texts drawn up in the Imperial period. Our minor records of later Egyptian astrology are thus fairly numerous.

Græco-Roman civilization throughout its entire geographical and historical range, until the establishment of the world-empire and its swift decline, never produced such monuments as we find in the great empires of the East. Observatories of colossal proportions, attached to primeval temples containing archives by which the positions of the planets might be traced and tested for centuries and millenniums, were never the work of Greece and Rome. Among the Etruscans, therefore, and subsequently among the Romans, it was the surrogates of astrology that occupied the central place. Apuleius explicitly asserts that the Chaldæans were the founders of astronomy and astrology. But, so far as the Romans concerned themselves with the study, they appealed to the works of an assumed Egyptian king called Nachepso and his astrologer Petosiris of Sais. At a later period Claudius Ptolemæus (A.D. 100–178) was regarded as the final authority in our twin sciences, and beside him we catch a glimpse of the somewhat legendary Hermes Trismegistos. But, as has been already indicated, the claims of astrology were not left unchallenged in this period. About the year A.D. 200 the famous physician Sextus Empiricus wrote a work in six books *πρὸς μαθηματικούς*, of which the fifth was directed *πρὸς ἀστρολόγους*. He prefaces his confutation by a sketch of the entire system of knowledge possessed by the *Χαλδαῖοι*, and in this he provides valuable materials for a thoroughgoing digest of the astrological texts in the library of Sardanapalus.

In this later period, however, astrology has maintained some degree of progress in the Far East. Among the Chinese and Japanese, occult art, in the modern 'fengshui,' seems rather to have taken the form of geomancy. Just as in the Near East astrology gave birth to hepatoscopy, so in China and Japan the interpretation of the planets in the celestial vault has been transformed into divination by the carapace of the tortoise. Similarly the Gypsies have developed a system of fortune-telling from the open hand; and the designation of the convexities of the palm as 'mounts' of the various planets shows us that this practice also is a surrogate of astrology.

LITERATURE.—The significance of astronomy and astrology for the interpretation of the religious conceptions of the ancient East, as also for the exegesis of the Bible, has only recently been recognized. There is as yet no comprehensive work dealing with the subject. Contributions to the study have come mainly from the hand of H. Winckler (especially in *Im Kampfe um den alten Orient*, Leipzig, 1907), of whom A. Jeremias (*Die Panbabylonisten, der alte Orient und die aegyptische Religion*, Leipzig, 1907) has proved an able ally. Fugitive essays have appeared in considerable numbers, principally in publications of the *Vorderasiatische Gesellschaft* and the *Orientalistische Literaturzeitung*; Hinrichs (Leipzig) has also issued a number. At first the new exegetical theory encountered very strong opposition, but afterwards seemed to have won a general assent; more recently, however, the work of Kugler, already referred to and appraised, has given it a partial reverse. K. Sudhoff (*Iatromathematiker, vornemlich im 15. und 16. Jahrhundert*, Breslau, 1902) and the present writer, starting from the history of medicine, have studied the ancient astronomy and astrology, and have arrived at the same results as Winckler, though by a very different path. The present writer has also written numerous essays on the subject, and these have appeared in various periodicals, medical, philological, and theological, esp. *Die Angaben der Berliner Planetentafel*, p. 8279, Berlin, 1903, *Das Horoscop der Empfängnis Christi*, do. 1903. These publications are based upon cuneiform and hieroglyphic (or demotic) texts which have only recently become accessible.

The leading work for the discovery of the relevant cuneiform texts is C. Bezold, *Catalogue of the Cuneiform Tablets in the Kouyunjik Collection of the British Museum*, 5 vols. The shorter texts are to some extent accessible in Thompson, *Reports of the Magicians and Astronomers of Nineveh and Babylon* (1900). Outgrowths of Oriental astronomy and astrology are found in the writings of Claudius Ptolemæus, Claudius Valens, Paulus Alexandrinus, Julius Firmicus Maternus, and Marcus Manilius, and also in the works of opponents, such as Sextus Empiricus, Cicero (*de Divinatione*), Horace, Juvenal, Pliny, and, in the 15th and 16th cents., Hieronymus Cardamus and Pico de Mirandola. Boll, *Sphæra*, is a modern comprehensive work dealing with classical astrology and astronomy, but the author had not the requisite data for a corresponding treatment of the ancient East. The latest cuneiform texts from the period of the Persian kings and the Seljūks have been utilized by Kugler in vol. i. of a work to be completed in 5 vols. E. Stucken, *Astralmythen* (Leipzig, 1907), admirably depicts the process by which the myths and legends of the various races of mankind grow out of the same original astrological conceptions, and arranges the stupendous mass of materials according to their affinities with the Biblical narratives regarding Abraham, Lot, Jacob, Esau, and Moses. A short manual of astrology by Ernst Mayer, entitled *Kurzes Handbuch der Astrologie*, and giving technical information about the placing of the horoscope, was published by Dekker (Berlin, 1891). A vast aggregation of data relating to the vestiges of astrology in Asia and the South Seas may be gleaned from the *Mittheilungen der deutschen Gesellschaft für Natur- und Völkerkunde Ostasiens*, in *Der Janus* (*Archiv für Gesch. der Medicin*), and in the publications of Sanskrit scholars. The attempt to furnish a more detailed bibliography than the present is always confronted with the difficulty of knowing which of the manifold ramifications of our subject the reader is interested in. In one or other of the leading works here cited, however, the student will find a more complete list of works relating to the particular field of inquiry with which he is concerned.

F. VON OEFELE.

SUN, MOON, AND STARS (Primitive).—Knowledge of the movements of the heavenly bodies is possessed in varying degrees by most primitive peoples. In the earlier stages of civilization that continued observation which is necessary to arrive at a reasoned explanation, which is the foundation of astronomical science, is not possible through lack of proper means of recording its results, nor is it called for by the practical requirements of a population which lives chiefly by hunting. For an agricultural people, however, foreknowledge of the recurring seasons becomes essential, and it is necessary that some means should be found to mark the proper seasons for performing the operations to ensure the food supply. In the stars, with their regular motions of rising and setting, primitive man has found the earliest and most convenient calendar. In default of a theory based upon a series of observations, the supposed movement of the sun round the earth, the phases of the moon and the motion of the stars, the shape and character of the sky, have been explained by formulæ composed of material drawn from the texture of man's religious beliefs. The celestial bodies, equally with his fellows and material surroundings, he considers to be animated with a personality like his own, though more powerful. Starting from this fundamental assumption, primitive man has fashioned for himself, in his legends, a fairly complete explanation of the celestial phenomena which come under his observation.

1. **Sun and moon.**—It is almost universal among primitive races that both sun and moon should be regarded as alive and quasi-human in nature. Their sex differs among different races, but the moon is more commonly male and the sun female. Relation between them, varying in character, is also recognized. Among the Dieri of Australia the sun is the daughter of a Dieri woman, who after her birth sank into the earth in shame. The natives of Encounter Bay say that the sun is a woman who has a lover among the dead. Each night she descends among the dead. At her rising she appears in a red kangaroo skin, given her by her lover. A Wotjobaluk legend relates that the sun is a woman who was digging yams and reached the West; after wandering round the earth she came back to the other side, and has done the same ever since. The Wurunjerri say that the sun is the sister of every one. This may be compared with the story of the origin of the sun told by the Arunta. At Alice Springs there is a tradition that in the Alcheringa the sun came out of the earth at a spot now marked by a stone in the country of the Bandicoot people, in the form of a spirit woman, accompanied by two other Panunga women, who were sisters, the elder of whom carried a child. The spirit woman went up into the sky, and she does this every day, visiting the old spot at night and rising in the morning. A medicine-man could see her in the hole, but not a person with ordinary vision. The two women settled among the Bandicoot people, and originated a local sun totem. This totem may be compared with the sun totem of the Incas. The sun has a definite relation to each individual member of the various divisions, belonging itself to the Panunga division, as did the two women. Among these people a ceremony connected with the woman and the child is performed, in which symbols of the sun are worn.

The Masai say that the sun married the moon, and they had a fight. Each damaged the other. The sun was so ashamed that he became bright, in order that people might not be able to look at him. The moon was not ashamed, and it is possible to see that her mouth is damaged and that one eye is missing.

It is interesting to note that, while the sun is a man and the moon a woman, the Masai word for sun, *eng-oloñg*, is feminine, and *ol-apa*, 'the moon,' is masculine. The Bushman story goes that the sun was an old man, from whose armpit light radiated; some children threw him up in the sky, where he stuck.

Occasionally both sun and moon are feminine. Among the Mantras the sun is a woman, who is continually being pulled by a string held by her lord. The moon is a woman, the wife of Moyang Bertang, who sits in the moon making nooses for men.

(*a*) *Origin and movements of the sun.*—The origin of the sun, as related in the Tembeh legend of Sam-mor and his battle with Naing, has advanced beyond the anthropomorphic stage. When Sammor had imprisoned Naing, he rolled the fire with which he had fought into a ball, and this, as the sun, still revolves round the mountain to watch Naing. This conception of the sun as inanimate is probably due to external influence, but it has a parallel among the Gallinomeros of Central California, where the hawk and the coyote, after jostling one another painfully in the darkness which then prevailed, collected two masses of inflammable substance; the hawk then flew up into the sky with them, and lighted them with flint. They give light as the sun and the moon. The Wurunjerri believe that the sun was made by Puppu-imbul, one of the race inhabiting the earth while everything was dark. This personage, it is hardly necessary to point out, belongs to the race of demiurges of which Prometheus is the type.

The sun did not always cross the sky in the same leisurely manner as at present. The great feat of Maui, the Maori hero, was that he tamed the sun. According to one version, he beat him so unmercifully that he lamed him, and he has walked slowly ever since. In Samoa the sun had a child by a Samoan woman, who trapped the sun by a rope made of vine. Another Samoan lassoed the sun, and made him promise to go slowly. The same or an analogous explanation is found in Aztec folk-lore and in North America. On the other hand, in Australia and in Melanesia the sun did not set. In the myth of the aborigines of Victoria, Norralie decided that the sun should disappear at intervals, and addressed it in an incantation, 'Sun,

sun, burn your wood, burn your internal substance, and go down.' The sun now burns his fuel in a day, and goes below for fresh firewood (R. Brough Smyth, *Aborigines of Victoria*, iv. 430). In Melanesia Qat (the Melanesian hero) went to Qong ('night') and begged assistance. The latter put him to sleep, and, in twelve hours or so, crept up from the horizon and sent the sun crawling to the West (Codrington, *JAI*, Feb. 1881). In a Brazilian myth, a man ('the great serpent') who owned night sent it in a gourd to his daughter on her marriage; the messengers opened the gourd and let it out.

Various explanations are given of the sunset. The simplest is that the sun sinks into a hole, occasionally the hole from which he arose. The Dieri say it sinks into a hole near Lake Eyre, and in the night travels underground to the East, in the same manner as it was believed to do in ancient Egyptian belief. Not infrequently the sunset myth takes the form of a legend of a personal hero plunging into the body of a personal night. Maui was caught in the mouth of Hine-nui-te-po, 'Great Daughter of Night,' and thus brought darkness and death into the world. Since then the sun descends into the under world, and repeats the battle with Hine-nui-te-po every night. An explanation of sunset is that Maui took fire, and when it burnt him he plunged into the sea. Among the Basutos, all men but Litaolane were devoured by a monster. He also was swallowed, but cut his way out. The Zulu story of the rescue of Princess Utombende is of a similar character.

(*b*) *Origin and movements of the moon.*—The moon occupies a prominent place in primitive folklore for which her periodical growth, diminution, and disappearance, phases more marked than those of the sun, may not unreasonably be held to be responsible. Like the sun, the moon is regarded as a living person. Allusion has already been made to the variation in the attribution of sex to the moon among different peoples. One or two further instances which illustrate other points of lunar mythology may be added. Among the Aruntas the moon is a big man (*etwa oknurcha*). They say that, when there was no moon in the sky, a man died and rose again as a boy. The people ran away. He said, 'Do not run away or you will die. I shall die, but will rise again in the sky.' He grew up and died, reappearing as the moon. Since then he dies periodically. When he is not visible, he goes away to his two wives who live in the west. A second legend of the origin of the moon, which is found among the same tribes, relates that the moon was carried by a blackfellow in the hollow of his shield, who hid it in a cleft of the rocks during the day. Once it was stolen from his shield while lying on the ground. He pursued the robber but could not catch him, so he shouted that the moon should go up into the sky and give light to the people during the night. In South-East Victoria in one myth the moon is an old man who climbed a tree to pick grubs. His sons made the tree grow to the sky, where he became the moon. The Dieri say that there was once no moon; the old men held a council, and a *mura-mura* gave them a moon in order that they might know when to hold their ceremonies. The same reason for the moon's existence is given among the Todas.

The marks on the face of the moon are explained in various ways. The Eskimos say that these marks are the ashes which were smeared on his face by his sister the sun, when he tried to embrace her. Among the Besisi it is said that their chief ancestor Gaffer Engkoh once fell to earth and climbed back to the moon by means of a festoon which he plaited. His comrade Porang Aliyan ascended with Engkoh, but the latter slipped back quickly, taking his rope with him. Porang now dwells in the moon, protecting the souls of the dead who visit the moon from wild beasts. The Mantras believe the dark spots on the moon to be a tree. The Malays see in the moon a banyan tree, under which sits a hunchback plaiting a fishing line. When the line is finished, he will fish up everything on earth, but a rat always gnaws away the line. This belief also occurs in Sumatra. The Malays also say 'the moon is great with a mouse deer,' a belief possibly derived from the Sanskrit idea of the hare which was taken up into the moon for protection. In Mexico it was said that a god smote the moon in the face with a rabbit (Sahagun, viii. 2); in Zululand and Tibet a hare was translated to the moon. The connexion between the hare and the moon is also found among the Namaquas of South Africa. The hare was sent to men to confer upon them a return to life after death, but by a mistake in the message made them mortal. In Fiji the same point of human mortality was argued between the moon and the rat. The latter prevailed.

The Wotjobaluk also connect the moon with a resurrection after death. When all animals were men and women, the moon used to say, 'You up again,' and the dead came to life. An old man said, 'Let them remain dead'; none then came to life except the moon. The connexion is obviously suggested by the necessity for finding an explanation of the phases of the moon. Various explanations are current. The Masai say that the sun carries the moon in his arms when she is tired. After carrying her for two days, he leaves her in his setting-place. On the fourth day she is visible to donkeys. On the fifth day men and cattle see her again. The Wiimbaio say that the moon did not die periodically until so ordered by Nurelli. The natives of Encounter Bay held that the moon was a dissipated woman who spent her time among the men, but when she wasted away they drove her out. While she is in seclusion she feeds upon nourishing roots and becomes plump again (Brough Smyth, *op. cit.* i. 432).

(*c*) *Eclipses.*—An eclipse, whether of the sun or of the moon, is at all times regarded with dread; it is almost universally believed, at the early stages at least, to be caused by a monster who devours, or attempts to devour, the luminary. See art. PRODIGIES AND PORTENTS, vol. x. p. 368 f.

2. Stars.—The belief that the stars are great men and divinities translated to the heavens occurs among nearly every people in the world. Stars are grouped together in constellations which represent persons, many of them large, sometimes including one or more of the constellations of our astronomy. The inhabitants of Torres Straits include in their constellation Tagai—a hero who stands at the head of a canoe holding a spear and a bunch of fruit—the Southern Cross, Scorpio, Sagittarius, Corvus, and stars of Lupus and Centaurus. The 'Shark' includes the Great Bear and Arcturus and Gemma. In New Zealand Orion's Belt is Maui's Elbow, while the Southern Cross is identified with the stern of the canoe of Tamarete. Among the Wurunjerri of Australia α and β Crucis and α and β Centauri and other stars are the sons of Bunjil, the latter himself being Altair. Two stars on either side of him are his wives, who belong to the black swan totem, while his brother Nurong and his wives are Antares and adjacent stars. Bunjil and his sons were translated to the sky in a whirlwind. The whole group is intimately connected with the totemic system, Bunjil or Pund-jel being an Australian demiurge. At Alice Springs in Australia the Aruntas say the Evening Star is a woman who went into the earth at a spot marked by a white stone at Temple Bar in the Macdonnell Range, leaving her *churinga* behind. Every child

conceived at this stone belongs to the Evening Star totem, although it is in the lizard totem country, and any child conceived *near* the stone is a lizard. Orion's Belt is said to be a group of young men dancing corroboree. Jupiter, the 'foot of day' (Ginabong-Bearp), was a chief among the old spirits, a race translated before the appearance of man. Among the Eskimos of Greenland, Orion's Belt is 'the Lost Ones,' a number of seal hunters who lost their way home. The Pleiades, an extremely important group of stars for primitive peoples, were known to the Indians of North America as 'the Dancers,' to the Lapps as a company of virgins, and to the Australians as a group of girls playing corroboree. The Aruntas believed them to be women who went up into the sky and have remained there ever since. A legend of the Wurunjerri runs that, when some young women were digging yams, the crow stole their yam sticks. They were swept into the air, when Bellin-Bellin let the whirlwind out of the bag, and the stars are the fire on the end of their yam sticks. Another version says that the group is Bunjil's daughter and two men who were turned into women by Bunjil's son, each receiving yam sticks from Bunjil's daughter. The almost unvarying association of the Pleiades with women among different races is remarkable. It thus appears that the legends which attribute an heroic and human origin to the stars and constellations contain the germs of conceptions which have been utilized by modern astronomy in mapping out the heavens.

Stars, however, are not always translated human, divine, and 'semi'-divine beings. Allusion has already been made to the Malay and Sakai belief that stars are clefts in a superincumbent rock. Take-mahuta, in the Polynesian story, after separating his father and his mother, stuck stars all over his father's body. Maui, after slaying his sons, placed an eye of each in the heaven as the morning and evening star respectively—a story which represents a transition stage between the two groups of animate and inanimate origin.

It is not surprising to find the stars regarded as the moon's children. The Mantras say that once the sun and moon, who were both women, had many children, the stars. They agreed to devour them. While the sun did as agreed, the moon hid her children, producing them afterwards. The sun, being very angry, now pursues the moon but cannot catch her, though sometimes she succeeds in biting her, causing an eclipse. The same story is told by the Hos of Chota Nāgpur. In this story, however, the sun threw a hatchet at the moon and cut her in two.

For practical purposes among most primitive peoples the stars perform a more important function than the sun. By their rising and setting the times of the feasts and ceremonies are determined, and among agricultural peoples their movements serve as a calendar by which the various operations in cultivating the soil are regulated. In the Torres Straits, Tagai marks the time for new yams and the migrations of turtle; Seğ, the time for another kind of yam. The Murray Islanders also use Tagai as a mark in navigation. The rising of the constellation Dorgai, which coincides with the North-West Monsoon, is the time to 'make dance.' The natives of Borneo, especially the Dayaks, watch for the Pleiades to determine when to prepare their ground for planting. When it is estimated that the wet season is approaching, men are sent to the forest to watch for the rising of the Pleiades. The Kenyahs and Kayans of Borneo measure the length of the sun's shadow by means of a marked stick with the same object (C. Hose, *JRAS*, Straits Branch, Jan. 1905). The importance of such observation of sidereal phenomena is evident when it is remembered that in tropical regions the seasons bring little or no sign of change to serve as the farmer's calendar. The Masai recognize that the rainy season is approaching when they see the Pleiades, while in the Society Islands the year is divided into two halves, *Matari-i-inia* and *Matari-i-raro* according as this constellation is visible above the horizon after sunset or not. In fact, over nearly the whole world the rising of the Pleiades is the beginning of the year or a cycle, marks the time for feasts, and is an occasion of ceremonial observance. It may be recalled in passing that Penrose found that the Hecatompedon and the old Erechtheum had been ascribed to the heliacal rising of the Pleiades on May day; and in Britain, it is suggested, while Stonehenge appears to have been built in relation to the rising of the sun at the summer solstice, the 'Hurlers' in Cornwall on *prima facie* evidence seem to have been built in relation to the heliacal rising of the Pleiades on May morning B.C. 1600 approximately.

In some cases the use of the stars as a calendar is not immediately obvious, but is a matter of interpretation. In Australia, Yuree and Wanjel (Castor and Pollux) pursue the Kangaroo (Capella) and kill him at the beginning of the great heat, and the mirage is the smoke of the fire they roast him by. Marpean-Kurrk and Neilloan (Arcturus and Lyra) discovered the ant-pupa and the eggs of the loan bird and taught the aborigines to use them for food. As Tylor points out, these legends and their analogues may fairly be interpreted as indicating the seasons when the pupa and eggs may be found, the great heat expected, and so forth.

3. Signs and omens. — The train of thought underlying primitive astronomical theory would seem peculiarly adapted to foster the magical conceptions and analogies upon which astrological reasoning is based. Omens and signs, favourable and unfavourable, are and have always been the object of constant observation in the past of savage and semi-civilized people. It is, therefore, not surprising that peculiar powers in controlling human events should be attributed to those heavenly bodies which are regarded as endowed with powers similar to but greater than those possessed by human beings. Even when a stage has been reached at which the magic powers of the witch no longer gain credence, belief in the power of the moon or the first star of the evening to grant a wish remains as evidence of a time when the favour of the heavenly bodies was essential to success. Lacking the knowledge necessary for the pseudo-scientific cartography of astrology, primitive races never attained the heights of judicial astrology. Yet the belief that, for instance, a child born under Leo would possess qualities usually associated with a lion is one with which a savage would find himself in full sympathy. The Malays possess an elaborate system by which the year is mapped out into lucky and unlucky periods depending upon a rotation of days, each associated with deities, planets, and lucky and unlucky colours, and are acquainted with the use of the magic squares. But their astrological science has been borrowed from the Hindus and Arabs. In the case of races which may truly be described as primitive, the germ of the science rather than the science itself is found, while vestigial traces of these primitive beliefs linger in the popular folk-lore of civilized countries. The belief that the weather changes with the phases of the moon is found among the Ewe peoples of West Africa, where a certain number of days' rain is said to accompany each of the four changes of the moon. At these times they are forbidden to take purgatives, and children and cattle are born. At the rising of Ezā (Orion) rain

falls for seven days in accordance with the number of stars in the group; three days' rain follows the rising of the group Atielo, while the star Toro is peculiarly favourable to huntsmen, who call this time *Ladorgbe*, 'animal chop grass' (P. Fr. Müller, 'Folkloristische Ewhetexte' (Gē-Dialekt), *Globus*, lxxix. Jan. 17, 1901). These beliefs, however, may be regarded as generalizations from imperfect data assisted by magic, rather than as originating in a magical connexion. A less doubtful case of intimate relation between celestial and terrestrial phenomena occurs in the widely distributed belief, still common in European folk-lore, that fertility of crops and success in an enterprise depend on an action undertaken under a waning moon. The Lithuanians wean boys on a waxing, and girls on a waning moon, believing that in the one case it provides strength, in the other, slenderness and grace.

An instance of a belief which most nearly approaches judicial astrology is quoted by Tylor (*Prim. Cult.*[4] i. 129) from Shortland. The Maoris when besieging a 'pa' believed that the result could be foretold by the relative position of Venus and the moon; if the planet were above the moon, the foe would conquer; if below, the home force would be victorious.

LITERATURE.—No comprehensive study of *primitive* astronomy on scientific lines has been made; reference to astronomical legends and a few identifications of stars known to the natives will be found scattered in works dealing with individual races. General principles of study will be found in E. B. Tylor, *Prim. Cult.*[4] 2 vols., 1904, and A. Lang, *Myth, Rit. and Relig.* 1899. See also Sir N. Lockyer, *Dawn of Astronomy*, 1894. For ceremonies connected with the Pleiades see R. Andree in *Globus*, lxiv. no. 22. Instances here quoted are taken chiefly from W. W. Skeat, *Malay Magic*, 1900; Skeat-Blagden, *Pagan Races of the Malay Peninsula*, 1906; A. W. Howitt, *Nat. Tr. of S.E. Aust.*, 1906; Spencer-Gillen, *Nat. Tr. of Cent. Aust.*, 1898; A. C. Haddon, *Head Hunters*, 1901; A. C. Hollis, *The Masai*, 1905; Sir G. Grey, *Polynesian Mythology*, 1855.

E. N. FALLAIZE.

SUN, MOON, AND STARS (American).—**1. Sources.**—A large part of our knowledge of the astrology and astronomy of the American Indians is derived from their traditions as reported by early European and American missionaries and travellers. These writers had the advantage of contact with the various tribes before European influence had extensively modified their modes of thought, but they paid little attention to astronomical traditions. The few constellations mentioned by them are seldom identified, and the identifications are frequently indefinite or incorrect. A number of works by native authors give tribal tradition in authentic form, but little astronomy.

In Mexico and Yucatan a few codices, which escaped destruction at the hands of the Spanish priests, contain many complex astronomical symbols of which little is definitely known as yet, but from which, undoubtedly, much will eventually be learned. They are supplemented by hieroglyphs on structures and monuments. In Guatemala there is the *Popol Vuh*, or 'Book of the People' (ed. and tr. Brasseur de Bourbourg, Paris, 1861), and in Peru Salcamayhua's Spanish account of Aymara Quichua antiquities (tr. Markham, Hakluyt Society, 1873). These manuscripts either are of pre-Columbian origin or present pre-Columbian material with slight European modifications. They include some myths and legends having an astronomical basis (cf. also Brinton, *Annals of the Cakchiquels*, Philadelphia, 1885; and *Tres relaciones de antigüedades peruanas*, ed. Ximenez de la Espada, Madrid, 1879). Until recently even scientific travellers have often shown indifference towards astronomical traditions, but ethnologists now recognize the importance of this subject and are collecting material which, in spite of the long contact between Indians and Europeans, affords sufficient evidence of native origin.

In North America these traditions are supplemented by a few valuable star charts. Three have recently been collected amongst the Osages, Pawnees, and Huichols (Dorsey, in *9 RBEW*, p. 378; *Field Columbian Museum Report*, xi. pl. 72; Lumholtz, in *Memoirs of the American Museum of Natural History*, iii. 57 ff.). The two first are intimately associated with the ritual of the tribal secret societies. The Osage chart represents the Hyades, Pleiades, morning and evening stars, sun and moon, and probably the Milky Way and part of Scorpio. The Pawnee chart shows the Pole Star, Great and Little Bear, Northern Crown, Orion, Hyades, Pleiades, Milky Way, and probably Capella; that of the Huichols depicts as stars or constellations the Scorpion (Scorpio) and its Heart (Antares), the Deer (Taurus?), which is pursued by the Dog, a Woman bearing a child, the Crab, Beehive, Humming Bird, and other objects. The winter counts of the Western tribes represented each year by some important event, which is pictured upon a buffalo hide. Naturally they include astronomical figures. That of Lone Dog, for example, presents the meteoric shower of 1833, a comet, and a solar eclipse. The altars of Pueblo secret societies furnish numerous stellar symbols, as is shown by the researches of Cushing and Fewkes in *RBEW*, *JAFL*, and *Amer. Anthropologist*. Tablets inscribed with astronomical characters have been found at Rockford, Illinois, Mitchell Co., North Carolina, and in Missouri. Excepting the rayed solar face, crescent moon, and morning and evening stars, the characters upon these tablets have not been satisfactorily deciphered.[1]

The Mexican calendar stones present another and an elaborate source of astronomical symbolism, to which considerable study has been directed (see CALENDAR [Mexican]). Inscribed stones of astronomical significance have also been found in the Chibcha region of Colombia. The symbols seem to correspond with those ascribed to the Chibcha calendar and constellations by Duquesne (cf. Bollaert, *Antiquarian Researches*, London, 1860; also Humboldt, *Researches*, and Lemly, in *Century Mag.*, 1891, p. 885). A circular gold 'zodiac' from Cuzco presents a solar rayed face surrounded by twelve unknown symbols (Bollaert, *op. cit.* p. 146; Markham, *Cuzco and Lima*, London, 1856, pp. 107–108; Winsor, *Critical and Narrative History of America*, Boston, 1884–1889, i. 235). A wooden box from the west coast of South America figured by Kingsborough (*Mexican Antiquities*, London, 1831, iv.) presents Peruvian symbols of the sun and moon, Orion, Taurus, the Pleiades, and other constellations, but they are associated with symbols of European origin.

A most valuable source of astronomical knowledge is the Peruvian star chart of Salcamayhua, a pure-blooded Aymara of the ruling class, who wrote during the first quarter of the 17th century. With the exception of a prudential reference to the symbol of the Southern Cross, this chart presents only native concepts. It gives symbols of the sun and moon, morning and evening stars, southern pole, Coal Sack, Milky Way, and all the zodiacal asterisms (cf. Hagar, in *Compte Rendu du Congrès international des Américanistes*, Paris, 1900, p. 271 ff.).

2. Scientific knowledge.—The use of gnomons, natural and artificial, was wide-spread in America. Amongst many of the tribes there are still old men who delight in determining the seasons and the time of day by the position and direction of the solar shadows. The Pueblos have measured and named the sunrise points on the eastern horizon so as to divide the year into two periods of six months, and the time of the equinox is determined with great care. The Zuñis used as a gnomon an erect sandstone slab adorned with a solar effigy (Dellenbaugh, *North Americans of Yesterday*, New York, 1901, pp. 305–306; Fewkes, *Annual Ceremonies at Walpi*, Leyden, 1895).

At Chapultepec, in 1775, a stone was found under which three crossed arrows pointed accurately to the equinoctial and solstitial sunrise points (Bollaert, in *Memoirs of the Anthropological Society of London*, i. 210 ff.). The main doorway of the chief temple of Cuzco fronted the north-east, so that at the June solstice the rays of the rising sun would penetrate into the temple and illumine the solar plate at the opposite end, thus recalling the temples of Egypt and Greece; and the early Christian cathedrals oriented to the sunrise point on the day of the saint to whom they were dedicated. It is not unlikely that the orientation of Mexican and Peruvian structures will enable future investigators to determine the dates of their construction by means of the method so brilliantly pursued by Lockyer in Egypt and Penrose in Greece (Lockyer, *Dawn of Astronomy*, London, 1894). Beebe has shown that the monolithic gateway and a large stone platform at Tiahuanaco probably served as a solar dial. The

[1] See *Proceedings of Davenport Acad. of Sciences*; J. P. McLean, *The Mound Builders*, Cincinnati, 1879, p. 118; Short, *North Americans of Antiquity*, New York, 1880, p. 38. W. S. Beebe, who made a special study of the Davenport and Piqua tablets, attempted a full explanation of both. He makes the former wholly and the latter partly astronomical, but his interpretation of the latter stands little chance of acceptance in the present stage of our knowledge. A copy of his privately printed notes is deposited in the Davenport Academy, Davenport, Iowa. One is in the author's possession.

sides of the pyramids of Mexico and Central America are often aligned to the cardinal points. In Mexico, Nobel describes a perpendicular shaft in the pyramid of Xochicalco which permitted the rays of the zenith sun to fall upon an altar in an interior chamber. The shadows cast by the steps of the pyramid of Papantla were observed for calendar purposes (Humboldt, *Researches*, ii. 87), and tradition indicates a similar use of the steps and platforms at Cuzco known as the 'Monkeys' Dance.' Mrs. Zelia Nuttall, moreover (*Boas Anniversary Volume*, New York, 1906, pp. 290–299), points out various pictographs in the Mexican codices which represent priests observing the stars to determine the time. The different divisions of time were marked by the sounding of drums or trumpets in the temples. The priests used various methods to fix the position of the asterisms. They observed them through the doorway of the temple, which was elevated above the surrounding country, sometimes placing forked or bifurcated sticks within the doorway to define the position more exactly, and sometimes using a peculiar figure representing the drawn-up limbs of a seated man for the same purpose. A possible use of rows of upright sticks is also indicated.

The Peruvians are also said to have noted the solstices and equinoxes by means of the shadows cast by certain columns. Those on the equator were held most sacred, because at the equinox they cast no shadow (Garcilasso de la Vega, *Commentarios reales de los Incas*, vi. 22). These columns have never been found, but circular stone sun-dials, called *intihuatana*, 'the sun tied up,' exist on the Carmenca hill at Cuzco, where the 'columns' are said to have stood, and elsewhere. A shadow is cast thereon by a small erect stone, which, Squier suggests, may rightly have been known as the *inti rucana*, or 'sun-finger.'

Alleged telescopic tubes have been found in the mounds of the United States and in Peru (Bollaert, *op. cit.* pp. 213, 276; du Gourcq, in *Popular Science Monthly*, xlv. 832), but were probably used by the physicians, who in the latter country were expert in sucking poison from wounds and diseased tissues. The Mexican astronomers, however, seem to have employed obsidian mirrors in their observations (Nuttall, 'Fundamental Principles of New and Old World Civilization,' in *Peabody Museum Publications*, ii., Cambridge, Mass., 1901).

The more advanced American nations, such as the Mayas and Aztecs of Mexico, and the Aymaras and Quichuas of Peru, seem to have attained an astronomical knowledge nearly, if not fully, equal to that of any people prior to the invention of telescopes; they had learnt all that could be learnt by the unaided eye. Their principal practical incentive to stellar observation was the accurate determination of seed-time and harvest, this being elaborated into a calendar. They do not seem to have attained to the heliocentric system, but they knew the cause of the lunar phases, and distinguished the five brighter planets. The Mexicans estimated their synodic periods accurately, and the Peruvians observed the sun-spots (Humboldt, *Vues des Cordillères*, ii. 302, *Researches*, ii. 173; Salcamayhua, *op. cit.* p. 131; du Gourcq, *op. cit.* p. 825), large spots being sometimes visible to the naked eye through the mist or light cloud (*garua*) which is of common occurrence in Peru. In some myths the sun and other celestial bodies, and even the earth, are represented as balls or globes. This does not necessarily imply either European influence or exact knowledge. It may be an analogy derived from the supposed hollow ball of the sky.

3. Astrology.—A system of astrology was undoubtedly in vogue in America. The *Tonalamatl*, or book of lucky and unlucky days, included in the Mexican codices, indicates the propitious and unpropitious times for performing certain actions. In the Codex Vaticanus a human figure appears surrounded by the day signs, which have also zodiacal associations. The commentator says that the influence of month signs upon the moment of birth was an established belief.

'The Mexicans,' says Sahagun (*Historia general de las cosas de Nueva España*, iv. Introd.), 'take much care to know the day and hour of birth of each person in order to conjecture his destiny, life, and death, but they do not base their prognostications upon the positions of the stars.' Nevertheless, the stars warn a god that he must go away in five years (H. Phillips, jun., in *Proc. of American Philosophical Soc.* xxi. 617 f. [Philadelphia]). In Guatemala diviners were called upon to determine the propitious date for each monthly festival. As soon as a child was born, it was brought before the diviner, who, observing the day of birth, told what the child would be and what disposition it would show. He announced these things after consulting a book which contained the month and day signs (Ximenez, *Las Historias del origen de los Indios de Guatemala*, Vienna, 1857, pp. 158–160). In Peru one class of priests devoted themselves to divination by observation of the stars, and the chief priest dwelt away from the Inca capital that he might observe them and meditate more freely upon them. In the solitude of the mountain deserts lived priests who contemplated and adored the stars 'almost without ceasing.' People visited them to learn about lost articles, absent friends, and future events. Even the wild tribes of Eastern Peru regard some constellations as propitious to man, others as hostile (Lorente, *Hist. del Peru*, Lima, 1860, p. 229; Markham, *Cuzco and Lima*; von Tschudi, *Travels in Peru*, New York, 1854, p. 288; 'Relacion anonima,' in *Tres relaciones de antigüedades peruanas*, pp. 157, 164, 178).

It is said that the coming of the Spaniards had been predicted many times by these observations. Atahualpa's general is quoted as saying to his ruler just before the arrival of the Spaniards became known: 'My lord, I watched the stars last night, and saw in them the presage of a great calamity.' Later, Atahualpa himself declared that the appearance of a comet in the Sword of Perseus presaged the death of a man of high rank, and that a similar sign had been seen in the skies a short time before the death of his father, Huayna Ccapac. He was murdered soon after. A diviner, by observing the appearance of the moon, is said to have foretold to Huayna Ccapac the civil war between his sons and the destruction of the Inca rule. Comets and a thunderbolt which fell upon that Inca's Cuzco palace occasioned analogous predictions. Similar prophecies in Mexico were not so clearly attributed to the stars (Garcilasso, *Commentarios reales*, tr. Markham, Hakluyt Society, v. 28, ix. 14; Humboldt, *Views of Nature*, London, 1856, p. 429; Prescott, *Conquest of Peru*, bk. ii. ch. 6).

4. Ritual.—The ceremonials of the various tribes also include astronomical features; in fact many of their elements seem to have originated in the wish to imitate on earth the aspects and movements of the celestial world. The imitations of animals in the dances of the primitive tribes arise among those more advanced to elaborate figures, dances, and processions reflecting the orderly movement of the sun and stars across the sky and the progress of time and of the seasons. The American Indians as a whole are a thoughtful and religious race, much given to ceremonials. Even their games and sports, even their ordinary details of domestic life, are made part of the religious ritual to be ceremonially performed, and from the grandest to the most insignificant details of their ritual much is based upon astronomical symbolism.

In the various ball games found from one end of the continent to the other, the movement of the ball originally represented that of the sun (Brinton,

Myths of the New World, New York, 1868, *American Hero Myths*, Philadelphia, 1882, p. 119). Among the Cherokees, prior to the contest, the opposing teams were carefully instructed in the use of magic formulæ, and the issue was supposed to depend upon the amount of magic power thereby developed (Mooney, in *7 RBEW*, p. 301 ff.). In Yucatan and Central America the ball court itself represented the celestial field. The game was won by the player who drove the ball through a stone ring upon which two interlaced serpents, symbols of the eternal years, were sculptured. The *Popol Vuh* describes contests at this game, the result of which determined the control of *Xibalba*, or Shadow Land; and Mrs. Nuttall asserts that the ball courts were also used as astronomical observatories. The Araucanians saw the divine will in the result of the game, and used it to decide the fate of those accused of crime.

It is probable that the annual ceremonial hunts, once common in the South-western United States, formed a terrestrial imitation of the celestial Hunter, as in Peru, and foot-races also symbolized the solar journey. In the Mexican game of 'those who fly' the celestial revolution was symbolized by four men masked as eagles who circled about a pole at the end of four cords wound round it (Clavigero, *Historia*, ed. Mora, Mexico, 1844; Nuttall, *op. cit.* p. 24 f.). Dice games, common in North America, reflect the celestial imagery on both dice and board. The Mexican game of Patolli uses a cruciform board representing the four celestial regions, through the divisions of which a stone marker progresses like one of the celestial bodies (Sahagun, *op. cit.* vi. 8; Culin, 'American Indian Games' in *24 RBEW*; Nuttall, *op. cit.* pp. 82, 87). A serpent-dance in which the dancers imitated the motion of the serpent existed until recently among the Micmacs and other Northern tribes, and in Peru. In the North the dance symbolized the movement of the Pleiades across the sky (Hagar, in *Congrès international des Américanistes*, New York, 1902, and *JAFL* xiii. 92 ff.). The famous serpent-dance of the Hopis, figured on Mexican and Central American monuments, was a rain-making ceremonial performed in August under the sign of the Tiger Sun (Leo). The well-known mural paintings in the Temple of the Tigers at Chichen Itza represent a similar ceremony also dedicated to the Tiger Sun. In the Mandan buffalo-dance, twelve dancers divided into groups of four represented the cardinal points, and doubtless also the twelve regions and the months. Two of the middle four were painted black and dotted white to represent the night sky and the stars. The other two, painted red, personated the day (Catlin, in *Smithsonian Report*, 1885, p. 359), and the movement represented alternating day and night. The Natchez ceremonially gathered to watch the rising and setting solstitial sun through the doorway of their temple. The sun-dances of various tribes dramatize the progress of time and the seasons. The nocturnal Iroquois feast of the dead seems to have celebrated the return of the spirits to earth over the Milky Way in spring and fall.

At the end of each fifty-two years' period the Mexicans expected that the midnight culmination of the Pleiades would mark the end of the cosmos, or its renewal for a like period. All fires were extinguished, and the advance of the Pleiades towards the critical point was observed from the summit of the mountain called 'Hill of the Star.' The stars having passed the meridian, a fire was kindled upon the summit, from which fires were re-lighted elsewhere, and the people gave themselves over to rejoicing (Sahagun, *op. cit.* tom. i. lib. 4, tom. ii. lib. 7; Torquemada, *Monarquia Indiana*, tom. ii. 292–295; Boturini, *Idea*, pp. 18–21; Clavigero, *Storia antica del Messico*, tom. ii. pp. 62, 84, 85; Mendieta, *HE*, p. 101; Acosta, *Hist. de las Yndias*, pp. 398–399). In Peru as in Mexico this date marked the entrance of the sun into the sign of the dead, symbolizing death, destruction, and renewal.

The rising of the morning star, the Pleiades, and Gemini was hailed with songs and dances by many tribes. In Mexico there was an annual sacrifice of a human being, who enacted the yearly course of the sun. He ceremonially ascended the steps of the *teocalli*, or god-house, to represent the sun climbing from the south to the northern solstice. At the moment when the sun reached the meridian he was slain, and his body was hurled down the steps to represent the declining course of the sun after the northern solstice (Hagar, *Peruvian Astronomy*). Similarly, among the Chibchas a human victim fastened on a pole was annually slain by the arrows discharged by a ceremonial procession of people masked and costumed to represent the various zodiacal asterisms (Duquesne, in Bollaert, *Antiquarian Researches*, p. 47).

About the time of the December solstice, though in recent times not every year, the Skidi Pawnees sacrificed a maiden to the morning star. There is no reason to doubt the indigenous origin of this very remarkable and suggestive ritual, which is described in art. PAWNEE, vol. ix. p. 699[a].

In similar obstacle legends among the more advanced tribal families of the American Indians there are indications that the astronomical symbolism was itself used to typify as the ultimate meaning the progress of the human soul (cf. Dorsey, in *Congrès international des Américanistes, XV[e] session*, Quebec, 1907, ii. 66–70, and Natalie Curtis, *The Indians' Book*, New York, 1907, pp. 102, 103; the deductions are the writer's, and will be found further developed in his *Peruvian Astronomy*).

A monthly ritual is known to have existed among the Pueblos, Mexicans, Mayas, Central American tribes, Peruvians, and probably the Chibchas. Among all of them the features of these festivals referred to some attribute of the zodiacal asterism through which the sun was supposed to be passing at the time.

The plan of the Peruvian temple of Cacha, or 'the messenger,' as well as the remarkable legend connected with it, points to a ceremonial procession enacting the yearly course of the sun within the building. The importance of the stellar cult in Peru is indicated by the fact that the Peruvians made images of all their constellations.

5. Mythology and star-lore.—The arch of the sky was generally regarded as a kind of transparent roof, over which the heavenly bodies walk. The Chinooks on the north-west coast and the Peruvians represented it by two oblique lines meeting in an acute angle. Possibly the 'Maya arch' possessed a similar symbolism.[1] On the Peruvian box the sky is seen as a woman's breast. It forms the clothing of the Huichol eagle-goddess and of the wife of the Pawnee Spirit of Life, and is symbolized by the concave interior curve of some Central American and Pueblo vases (Dorsey, *op. cit.* p. xviii; Stevenson, *op. cit.* p. 24). Above the sky dwells the Sun Father, with his wife the Moon Mother (who is sometimes also his sister), attended by the divine pair of the morning and evening stars, and surrounded by their stellar children.

The sun and moon were regarded as the progenitors of the stars and of mankind, but seldom or never as the supreme celestial powers. They

[1] Collection of A. F. Chamberlain; Hagar, *Peruvian Astronomy*, Salcamayhua Chart.

were the objects of a celestial cult existing practically everywhere in America, in which, at different times and places, sun, moon, and various constellations seem to have assumed predominance without occasioning more than a relative change of influence. Nor is there much evidence of conflict between the votaries of the various aspects of the astronomical cults. Sectarianism was almost unknown in the natural religions of America; such tortures and persecutions as existed in Mexico, for example, had little or no connexion with religious or theological differences. In Mexican tradition two men, one of them leprous, threw themselves into a fire and came out respectively the sun and the moon.

The gender of the sun and moon is sometimes reversed. A legend found in almost identical form among the Eskimos, the Cherokees, and the Amazon tribes personifies the moon as a man who secretly visited his sister at night. She, desiring to identify her unknown visitor, rubbed upon his face some black substance, which produced the lunar spots. A similar legend occurs among the Caddos (Dorsey, *Traditions of the Caddo*, Washington, 1905, pp. 11–12). The Iroquois saw in these spots an old woman who each month stirs a bowl of hominy with her cat (dog?) seated beside her. The Peruvians interpreted them as resulting from the embraces of a fox enamoured of her beauty; the Mexicans as a form of a rabbit, with which the gods struck the face of the moon, wishing to lessen its light, which formerly was as great as that of the sun. According to the Mexicans, the moon is always running after the sun, but never overtakes him. The divine being Quetzalcoatl made his son the sun, the god of water made his the moon (Phillips, *op. cit.*). The Onas of Patagonia make the sun pursue the moon (his wife) because she overheard some of the secrets of the male secret society. In terror she sprang off a cliff, the sun followed, and both jumped into the sky, where the pursuit continues (Barclay, in *Geographical Journal*, xxii. 62). In Corvichan tradition the sun, moon, and stars were shut up in three boxes, which were opened by the hero Yehl, whereupon they escaped to the sky (Deans, in *AAOJ* x. 111).

In higher Peruvian symbolism, the sun was tied by an invisible cord to the invisible pole of the sky, and was driven round it like a llama by the power of the Universal Spirit, although generally, after passing over the sky, he was thought to enter a cave in the west and to proceed by a subterranean passage to emerge next morning in the east. An equally interesting explanation of the origin of night and day is found in the Wichita legend (echoed by the Caddo) of the three deer, who are three stars, pursued by a fourth, which is a hunter who will overtake them at the end of the world. One deer is white, representing day, one black, representing night, one half black and half white, representing alternate day and night. The last was wounded, whence we have day and night (Dorsey, *Myth. of the Wichita*, Washington, 1904, pp. 21, 25–26, *Traditions of the Caddo*, pp. 13–14).

Among the Peruvian coast tribes, according to Garcilasso, the sun plunged into the western ocean and dried up the waters with his heat both where he entered and where he emerged—whence, apparently, the tides. In numerous North American legends he is visited by terrestrial travellers, whom he receives kindly, and to whom he sometimes imparts supernatural powers. The Mexicans described how he was once caught in a snare which a hero had contrived for him. This legend, which is also Polynesian, probably refers to the solstices, when the Indians generally thought of him as seated or resting, since they observed that for several days at these seasons he moved neither north nor south at his rising, but appeared at the same point on the horizon. The Mayas accordingly called these days 'the bed of the sun'; and at this time the Mexicans, Mayas, and Peruvians refrained from labour in imitation of the solar repose. The Mayas symbolized the June solstice by a tortoise, that of December by a snail, because of the slow motion of these animals (Forstemann, 'Commentary on Maya MSS' in *Peabody Museum Papers*, vol. iv. no. 1, p. 45, Cambridge, 1904; Schellhas, 'Representation of Deities of the Maya Manuscripts,' *ib.* no. 2, p. 115, Cambridge, 1906).

The Peruvians represented the sun as a bearded man in the prime of life, who impressed his footprint on a rock to mark the height of his power. This affords an explanation of a world-wide type of solar legends. Throughout America the solar rays were symbolized by hair. In Peruvian art the sun becomes the conventionalized face of a man upon which appear marks called tears by some, but perhaps having a pathological meaning. The Mexican hero Citli shoots three arrows at the sun and succeeds in wounding him. The enraged sun returns one arrow, which pierces Citli's forehead (Mendieta, *op. cit.* p. 77). The sun is the Spider Woman of some western tribes, the Ojibwa Wigwam of the Great Spirit, and the Zuñi shield of burning crystal which he carries, while the Kutenai Coyote manufactures the sun out of grease made into a ball (Chamberlain, in *AAOJ* xvii. 69). In Peru an oval plate, the symbol of the All-pervading Spirit, ultimately manifested in fire, earth, air, and water, was called the image of the true sun, of which the solar orb was only the reflexion. The sun, says the Quichua, Blas Valera, was the child of the Creator, and his light was that part of his divinity which the Creator had imparted to him. It was considered sacrilegious to look at his face; but early writers give several accounts of Inca rulers (particularly Huayna Ccapac) who did so, and who declared their scepticism of the supremacy of an object which never rested, but eternally moved upon its track like a driven animal, whose face the clouds obscured. From the nature of their light, gold was sacred to the sun and silver to the moon.

Eclipses were regarded as attacks made by some insect or animal upon the object enshadowed. In accordance with a world-wide custom, a terrific noise was made to frighten away the attacking monster, although the Tlascalans believed that the sun and moon were fighting. To induce them to cease, red-skinned people were sacrificed to the sun and albinos to the moon. The Peruvians thought the sun was angry when his face became obscured, while under like conditions the moon was believed to be ill. If her light disappeared altogether, she was dead and would fall from the sky upon earth, killing every one upon it. Dogs were beaten, as the moon was thought to be fond of them because they had rendered her a certain service, and it was hoped that their cries would induce her to uncover her face. A similar custom existed in Mexico (Ixtlilxochitl, *Hist. des Chichimèques*, Paris, 1840, cap. 6; Oviedo, *Hist. gen. y nat. de las Indias*, Madrid, 1851, xxix. 5; Piedrahita, *Hist. del Nuevo Reyno de Granada*, Antwerp, 1688, v. 1, vii. 6; Garcilasso, *op. cit.* xi. 1).

The altruistic spirit of the Pueblo community may be seen in the legend that the moon was once as bright as the sun, but gave up part of her light that people might sleep at night. According to the Sioux, the diminishing of the moon is caused by the nibbling of field mice, who thus prevent it from growing too large and injuring the earth (*Red Man*, xvi. no. 45). The profile face of the woman in the moon is figured on the Salcamayhua

chart. The Osages and the Mexicans seem also to have observed her. As the sun, being a male, watches over the fortunes of men, so the female moon is the guardian of women, to whom appeals for help were addressed in childbirth.

According to the Micmacs and Ojibwas, the stars are the lights of camp-fires before the wigwams of the dwellers in the land of the sky. Here and there we see them grouped in villages, and the brightest represent the largest fires before the dwellings of the chiefs. By other North American tribes they are described as birds that fly to the sky at night, by the Mexicans as eyes. Some Brazilian tribes regard them as rifts in the canopy of the eternally glowing sky-land (Seler, *Codex Vaticanus*, London, 1902, p. 44; Hagar, 'Micmac Star Lore,' MSS; Nery, *Land of the Amazons*, London and N.Y., 1901, p. 47). These simple and primitive notions existed coincidently with the division of the sky into constellations bearing the names of animals, plants, and frequently of inanimate objects.

Among the American tribes we find single stars named after individual objects, and groups forming true constellations; but probably nowhere in America is a constellation recognized which has become conventionalized like our own to such a degree that the derivation of the name is not really apparent from the alignment or other features. The morning and evening stars were naturally the most important of the stellar host. In the legends of the Cherokees, Peruvians, and others, the morning star appears before the first rising of the sun. It is the great star, the warrior, or messenger who goes in advance to announce the coming of his solar master. Its advent was hailed with incense and dances. It was widely symbolized by an equal-armed red cross. An Ojibwa legend makes it an older sister, who at her own desire was borne by the winds into the eastern sky, whilst her brother ran up a high mountain to hunt. So, according to Diodorus Siculus, the divine youth Hesperus went to the summit of a mountain at night to study the stars and a great wind carried him into the sky, where he became the evening star (Schoolcraft, *Hiawatha Legends*, Philadelphia and London, 1856, p. 90 ff.).

Among the Caddos the morning star was the errand man selected by the moon to be his assistant chief and to call the people together. He used to get up early during war expeditions, long before dawn, to go round the camps and wake the people so that the enemy would not find them. That is the reason why he gets up so early now. Morning Star has three brothers, Evening Star, North (Pole) Star, and South Star. Their father's name was Great Star, and he was the chief of the people (Dorsey, *Traditions of the Caddo*, pp. 7–8, 15).

In America the evening star was usually regarded as a woman, because it governed the time of family re-union at home, though among the Zuñis it is the twin brother of the morning star. In Mexico it is the Lord who comes with his torch to light the dwellings on high, in Peru the female maize-grinder, the torch in the west, while among the Micmacs it is leader of the stellar tribe. Its symbol is frequently a white cross. It is the mother of all things to the Skidi Pawnee, who keeps a garden in the west in which the sun rests at night, where the corn is always ripening and much buffalo meat is stored (Schoolcraft, *op. cit.* p. 90 ff.; Cushing, *Zuñi Folk Tales*, New York, 1901, p. 378; Dorsey, *Traditions of the Skidi Pawnee*, pp. xv, 5; Hagar, *Peruvian Astron.*, ch. on 'Cult and Symbol,' pp. xv, 3). As the converse of the morning star, the Caddos believe that the evening star would go back a long distance upon the trail and warn his people if the enemy approached (Dorsey, *Traditions of the Caddo*, p. 15).

The identity of the planets, whether the morning or the evening star, was recognized in Peru, Mexico, California, and parts of South America. The Peruvians made Mercury the ruler of merchants, travellers, and messengers. The Amazon tribes call it 'Deprived of Fish,' since it is believed to cause a scarcity of food fishes. Venus, in Peru, governed the daughters of the rulers, and women generally, dawn, rains, and flowers; Mars, war and soldiers; Jupiter, public matters and food supplies, and to him they offered firstfruits. The Peruvians placed Venus alone of all the stars in the dominion of the sun, evidently because it alone is sometimes visible in the full solar light. Because of its brilliant rays they called it Chasca, 'Curling Hair.' Because of its beauty they said that the sun never permitted it to wander far from his presence—a poetical interpretation of the fact that Venus never departs as far from the sun as the major planets. They also called this planet Chasqui, 'the Messenger,' because its swift passage from star to star suggested the swift running messenger upon the highways (Hagar, *Peruvian Astron.*, ch. on 'Cult and Symbol'). In the codices it is represented by numerous symbols, in the temple of Mexico by a high column, and in the myths it is identified with Quetzalcoatl. The Californian Indians say that the sun has two daughters, Mercury and Venus. Twenty men kill them, and after fifty days they return to life (Mendieta, *op. cit.* pp. 82, 83; Nuttall, *op. cit.* p. 53; Emerson, *Indian Myths, Legends, and Traditions*, Boston, 1885, p. 481; Nery, *op. cit.* p. 251; *Explication Codex Telleriano-Ramensis* in Kingsborough, *Mexican Antiquities*, 191).

The Milky Way in North America generally, and among the Guaranis of Paraguay, was the path of spirits, over which the souls of the dead pass between this world and the sky-land of the hereafter. Those of the good follow the broader and easier arm, those of the evil-doers the narrow and difficult arm. It is the Cherokee and Pueblo 'Way of Meal,' the Micmac 'Ancient Trail' and 'Way of Reeds,' the Californian 'Backbone of the Sky,' the Pawnee 'Dust raised by Buffalo Racing.' A Zuñi legend calls it the 'Great Snow Drift of the Skies' (Stevenson, *op. cit.* p. 25; Cushing, *op. cit.* p. 581; Dorsey, *Traditions of the Skidi Pawnee*, p. 57; Hagar, *Cherokee Star Lore* [in *Boas Anniversary Volume*, p. 354 ff.]). In Peru and at Zuñi, as among the ancient Sumerians, it is associated with a gigantic celestial serpent. On the Osage star chart it is figured as a river, and it appears as a celestial stream in the mythology of the Peruvian and Amazon Indians. In Peru, as in the legends of the Ojibwas and Cherokees, and as in the Euphratean region, China, and Japan, this river is associated with the passage of souls. The Cherokees and the Kutenai also call the Galaxy 'the Way of the Dog,' the tribes of Guiana 'the Way of the Tapir' and the 'Path of the Bearers of Whitish Clay' (Brett, *Indian Tribes of British Guiana*, New York, 1852, p. 107; Chamberlain, in *AAOJ* xvi. 69).

In the sand paintings of the Mission Indians of California the outer circle is called 'Our Spirit,' a name of the Milky Way. The whole represents the world resting on the Milky Way. A gate or door to the north permits the escape of the soul at death.

The Cherokees recognize two dog stars, Sirius and Antares. In spite of the identical name of the former in our tradition, this is probably a native name, for it is explained by a Cherokee legend which bears no resemblance to its Oriental analogue. In it the two dogs act as guardians of

'the Way of Souls,' at the extremities of which they are stationed, and they must be propitiated with food before they will permit the souls to pass. The Winnebagoes, Ojibwas, and Huichols also recognize a dog star, and the Hindus and Zoroastrians likewise place two dogs upon the way of souls. The Caddos say that a dog gifted with prophetic powers talked with its master, the pair becoming two bright stars in the south (Dorsey, *Traditions of the Caddo*, p. 25).

The Pleiades are the most conspicuous constellation in the star-lore and ritual of the American Indians, though in North America they share the leadership with Ursa Major. Throughout America they are known as the stars of harvest and of the propitious rains. Their Peruvian name 'Granary' is echoed by the Eskimo 'Sharing-out of Food.' In allusion to their alignment they were generally known as a group of various objects: in Peru 'the Doves,' in Guatemala 'the 400 Young Men,' and in Mexico 'the 400 Rabbits,' patrons of feasting and of intoxication. They are also the Algonquian 'Sweating-Stones,' referring to the seven stones with which the sacred bath of the medicine-man was heated. Their Maya name and Micmac symbol, the rattle of the rattlesnake, suggest an association with the group of small mounds on 'the Way of the Dead' at Teotihuacan, for these mounds are traditionally dedicated to the stars, and from some of them have been exhumed large and erect rattle figures, which were evidently used as altars.

Another important aspect of the group is that of 'the Dancers,' suggested by the twinkling of the closely grouped stars. The whole stellar world follows the group, as they perform their cosmic dance across the sky; and so on earth their rising was hailed by Brazilians, Cherokees, Micmacs, and probably many other tribes, with an imitative song and dance referring more or less directly to the eternal procession of the heavens. The Iroquois, Housatunnuks, and Cherokees have, or had, an explanatory legend which describes how a group of boys, while dancing, ascended to the sky and became the Pleiades. Among the Caddos there are seven brothers who played all day long. Being scolded by their mother and refused food, they danced round the house, gradually rising from the ground until they reached the sky. As they disliked work, they disappeared in spring, when work time begins (Dorsey, *Traditions of the Caddo*, p. 64). The Blackfeet believe that they ascended because their fathers gave to their sisters, instead of to them, the yellow skins of the buffalo calves they had slain. In revenge they determined to go away each year when the buffalo calf skins became yellow. This occurs in May, when the Pleiades are hidden in the sunlight. The Kiowas call the Pleiades 'the Star Girls,' and they are probably represented by the dancing stellar maidens who descend to earth in the poetic legend of Algon. The seventh Pleiad appears in the Cherokee and Iroquois legends, in the former as a boy who is knocked down with a pole before reaching the sky, in the latter as a star whose light is dimmed because of his desire to return to earth (James Mooney, letter to author; R. W. Wilson, *AAOJ* xv. 149; Emerson, *op. cit.* p. 72; Sergeant, *Housatunnuk Indians*, Boston, 1753; Domenech, *Deserts of North America*, London, 1860; Schoolcraft, *Hiawatha Legends*, p. 116 ff.; Mrs. Erminie Smith, in *2 RBEW*, p. 80).

Almost invariably seven stars are attributed to the group, thus including one star which, though of the sixth magnitude while its companions are of the third and fourth, may be seen by one with strong sight or in a clear atmosphere. The Cherokees also relate that the seventh Pleiad fell to earth, leaving a fiery trail. He became a bearded man, who warned them of the coming flood. So in Peru the approach of the Pleiades to the meridian enabled the llamas of Ancasmarca to warn their shepherd of the coming of the annual deluge or rainy season in November. In Mexico the six *tzontemocque*, or stars which fall at the deluge, seem to have been Taurid meteors (Mooney, in *17 RBEW*, p. 621; *Explication Codex Telleriano-Ramensis*). 'If people will look at these stars (the Pleiades),' runs the Pawnee song, 'they will be guided aright.' Many tribes actually did use them as a guide by night (Morgan, *League of the Iroquois*, Rochester, N.Y., 1857, ii. 106). Everywhere the Pleiades are a peaceful, beneficent, and friendly constellation; and there are some indications in Peru and elsewhere that they were once regarded as being (or having special influence over) the home of souls.

The pole star of the Northern hemisphere seems to have been observed by all, or nearly all, the northern tribes. It is the Ojibwa 'Man who walks behind the Loon,' a disappointed lover, who, metamorphosed into a firefly, flew to the sky; in another version a hunter of bears. The Kutenai call it a female grizzly bear; but this apparently refers also to a constellation which includes Ursa Minor and Ursa Major. The Sioux declare that 'all stars walk around the pole star, which is the star that does not walk.' The Micmacs describe it as a bear hidden in a den, about which a group of hunters (Ursa Minor) eternally circle in a vain attempt to discover it. The Pawnees call it 'the star that does not move,' and regard it as the chief of the stars. In the Southern hemisphere the pole is indicated on the Salcamayhua chart as the apex of two slanting lines, which form the sky roof of the world. To it point three stars of the Southern Cross, called the male group, and having phallic attributes. The Maya name of Vega is 'Scrotum Star,' but this star ceased to mark the north pole several thousand years ago. The Peruvians used the Southern Cross to indicate the divisions of the night, the Mayas to indicate the seasons (Emerson, *op. cit.* p. 58; La Flèche in *AAOJ* vii. 106; Chamberlain, *ib.* 1770; Copway, *Traditional History of the Ojibway Nation*, London, 1850, p. 113 ff.; Dorsey, *Traditions of the Skidi Pawnee*, pp. 3–4).

The stars of Ursa Major seem to have been called 'the Bear' by the Indians of practically the whole of British America and the United States. An accompanying legend is found in almost identical form among the various Algonquian tribes, the Housatunnuks, Iroquois, and the Cherokees, but is given most fully by the Micmacs. The four stars of the body of Charles's Wain, or the Dipper, as Americans call it, form the body of the bear. The three following stars, ϵ, ζ, η, with four trailing behind them in the form of a bow (γ, ϵ, η Bootis, and Arcturus), are seven hunters, who are pursuing the animal. The little star, Alcor, close to the second hunter, is the pot in which they intend to cook her meat. Corona Borealis and μ, δ Bootis form the den from which she climbs down in the spring. In the summer she runs across the sky with the hunters in full pursuit; in the fall she is overtaken and shot, and begins to fall over on her back. The blood from her wound causes an eternal stain upon the breast of the foremost hunter, the robin, and, dripping upon the trees of earth, it gives to the foliage its blood-red autumn hues. But the bear eternally returns to life. Through the winter she lives in her den invisible (below the horizon), to issue forth again in spring, and thus eternally to renew the celestial drama. The seasonal features of the

legend correspond accurately with the actual positions of the stars in the early evening. There is good reason to believe that this is a native legend, or at least one of pre-Columbian origin, though the earliest reference to it seems to be by Le Clerq in 1691 (Hagar, in *JAFL* xiii. 92 ff.). In connexion with the hunting concept, it is noteworthy that the Wichitas regard the Great Bear as the patron of those about to engage in war expeditions (Dorsey, *Myth. of the Wichita*, p. 18).

The Blackfeet know the principal stars of Ursa Major as seven boys, all save the youngest of whom (Dubhæ) had been killed by their sister. The Sioux call the four body stars the coffin. It is borne by four men who are followed by mourners. Mizar and Alcor are called 'She who Comes with her Young One Weeping.' The Ojibwas also called these stars 'the Fisher,' and the Zuñis represented them by seven white pebbles in the rites of the 'Priesthood of the Bow.' The Pawnees described Corona Borealis as a circle of chiefs, in whose honour was founded the society of 'Chief Dancers.'

The Belt of Orion among the Point Barrow Eskimos becomes three men who were buried in the snow, the Micmac 'Three Fishermen,' the Zuñi 'Hanging Lines,' and the Patagonian 'Three Bolas,' or round stones with which animals are slain by hunters. The Peruvians, like the Basques and the people of Deccan, call it 'the Steps.' The whole constellation is the Zuñi 'Celestial Hunter' pertaining to the sun. In Peru it is symbolized by crossed arrows, and relates to hunters and hunting. A myth makes it the Promethean figure of a criminal raised aloft for punishment by two condors. It may be connected with the Mexican Citli, 'the Bowman.' The names of a few other constellations and single stars have reached us, but present no features of special interest.

In view of the similar and wide-spread symbolism associated with some constellations in America, a more or less uniform system of celestial symbolism may have existed through a large part of the continent, similar to the primitive symbolism of the eastern continent in some elements, yet unique in others.

Unquestionably many of the symbolical concepts have been transmitted from tribe to tribe for long distances. Many of them are of pre-European, or at least of pre-Columbian, origin, and the analogies which they present with Oriental symbolism must be explained either as like effects of like independent causes or by pre-Columbian intercommunication between the continents. The weakness of the former explanation lies in the complexity and conventionality of the concepts, and in the difficulty of tracing the symbolism to any natural basis. The American zodiacs, for example, reveal analogies with the ancient Oriental zodiacs in every sign, yet in few if any instances, either in the Orient or in the Occident, are we able to explain why these signs were so named or why their symbolical attributes are what they are. The zodiac is older than its seasonal associations; its origin remains unknown, yet we find it in similar form in America and in the Orient. The same argument applies, although perhaps less forcibly, to a large part of the astronomical symbolism of America.

LITERATURE.—The literature has been given throughout the article.

STANSBURY HAGAR.

SUN, MOON, AND STARS (Buddhist).—The astronomical ideas found in Buddhism do not form an independent system, but have developed in close relation with Hindu theories. The problem is rather to determine what stages of development are to be found in the canonical and later books. Thibaut[1] divides Indian astronomy into three periods: (1) that of the Vedas and *Brāhmaṇas*, (2) the middle period with a fully developed native Indian system, (3) the third period, showing Greek influence. The Buddhist scriptures cover a long time, some of the later containing references to the Greeks, but it is to the middle period, and rather to the early stages of this, that the astronomical notions of these works belong. They are in the main the same as those that we find in the *Purāṇas*. The Hindus had two important uses for astronomy: the sacrifices and astrology, neither of which was countenanced by the Buddhists. The latter had no special motive for paying close attention to astronomical theory beyond that required for determining the periods of the lunar month with its fast-days, the period of Retreat in the rainy season, and the divisions of the day. According to *Vinaya*, ii. 217, a monk who lives in the forest is to learn 'the positions of the lunar signs (*nakṣatras*), either the whole or one section, and is to know the cardinal points.'[2] At the end of the ordination service the process of 'measuring the shadow,' *i.e.* calculating the time of day, is performed in order to determine the seniority of the monk, and he is instructed in the length of the seasons and division of the day.[3]

1. **Position of sun and moon.**—The heavenly bodies that we see are the vehicles of gods, who have been thus reborn through their merit, and who are associated with the thirty-three gods, but below them in rank.[4] The moon, the sun, and the constellations come as gods in the retinue of Sakka to visit Buddha,[5] and in *Dharmasaṃgraha*, 10, the moon, sun, earth, and the *asura* Rāhu occur along with the guardians of the ten quarters as world-protectors. When sun and moon occur together, the moon is always mentioned first.

In the scriptures there is no systematic description of the heavenly bodies, but the account given in the *Sārasaṃgraha*[6] corresponds to scattered notices in earlier works and probably underlies them. The earth, a flat disk, is 1,203,450 leagues (*yojanas*) in diameter and 3,610,350 in circumference. In the centre is Mt. Meru, rising 84,000 leagues above the surface of the earth, and round it circle the sun, moon, and stars, shining in turn on the four continents round Mt. Meru.[7] Night is caused by the sun passing to the other side of Mt. Meru. The diameter of the moon is 49 leagues and the circumference 147; of the sun 50 and 150 respectively.[8] The sun as the vehicle (*vimāna*) of the god is one league higher in position than the moon. It is of crystal outside, gold within,[9] and hot within and without. The moon is of silver outside, of jewel within, and cool within and without. The sun has three paths—*ajavīthi*, *nāgavīthi*, and *govīthi*—according to its apparent course in the ecliptic during the seasons along the equator, and above or below.[10] This fact appears to be referred to in the *Sīlāni*,[11] where the sun and moon are spoken of as going along their paths or out of their paths. Whether there was any early theory

[3] *Upasampadā-kammavācā*, tr. J. F. Dickson, Venice, 1875 p. 13; I-tsing, *A Record of the Buddhist Religion*, tr. J. Takakusu, Oxford, 1896, p. 100.

[4] *Jātaka*, no. 450. [5] *Dīgha*, ii. 259.

[6] Cosmological passages are quoted in R. S. Hardy, *Legends and Theories of the Buddhists*, London, 1866, appendix.

[7] *Aṅguttara*, i. 227.

[8] The ratio of the diameter and circumference of a circle is thus 1 : 3, as in *Jātaka*, v. 271. This illustrates the rudimentary character of Buddhist astronomy.

[9] We should expect gold outside, but such is the text.

[10] So, but more elaborately, in the *Viṣṇu Purāṇa*, bk. ii. ch. 8.

[11] *Dīgha*, i. 10; cf. *Dialogues of the Buddha*, tr. T. W. Rhys Davids, London, 1899, i. 20.

of the cause of revolution, apart from the choice of the god of the luminary, is not clear. The Chinese sources of A. Rémusat state that five vortices of wind support and move the vehicle of the sun in the required directions, and five other vortices similarly move the moon.[1]

2. Eclipses.—Eclipses are due to the *asura* Rāhu, who is stationed at the moon's nodes, and periodically swallows the sun and the moon. The legend that Rāhu is the monster's head, severed when he was drinking the ambrosia produced at the churning of the ocean, appears not to be early Buddhist, nor even ancient Hindu. It is absent from the account of the churning in the *Viṣṇu Purāṇa*.[2] Buddhaghoṣa describes Rāhu not as a head, but as having a complete body, of which he gives the dimensions.[3] The Puranic notion of Ketu as the severed body of Rāhu at the descending node, although mentioned in *Mahāvyutpatti*, 164, and implied in *Abhidhānappadīpikā*,[4] 61, among the 'nine planets,' is a late borrowing from Hinduism. Two ancient *suttas* describe the moon and sun as being afflicted by Rāhu and appealing to Buddha, who commands Rāhu to let them go.[5]

3. Planets.—The stars also are said to move along and out of their paths.[6] The term here used for star is *nakkhatta* (Skr. *nakṣatra*), and probably refers to the planets, as Buddhaghoṣa understands it in this context.

The only planet distinctly mentioned in the *Suttas* is Osadhitārakā. That this is Venus may be inferred from its being described as the brightest of the luminaries next to the moon and as appearing in the morning.[7] The Sanskrit recension of the *Dīgha* passage in *Mahāvyutpatti*, 71, definitely identifies it with Venus by substituting Uśanas, one of the Sanskrit names of this planet, for Osadhi. The name Osadhitārakā is unexplained. The phrase *Osadhī viya tārakā*, 'like the star Osadhi,'[8] shows that it does not mean 'star of plants' (as in *oṣadhipati*, 'lord of plants [or of the *soma*-plant],' a title of the moon). The possibility that *osadhī* is a corruption of *auṣasī*, 'star of dawn,' is attractive, but there is nothing in texts or commentaries to support it. The same is the case with the view of Kern that it is a corruption of *osanī* = Skr. *auśanī*, a derivative of *uśanas*.[9]

4. The lunar zodiac.—The term *nakṣatra* has been from late Vedic times applied especially to 27 or 28 constellations lying roughly along the ecliptic and forming a lunar zodiac; and from the Buddhistic use of many of them as proper names it may be inferred that they were known to the earliest Buddhists. They are as follows:

(1) Assayuja (β, γ Arietis), (2) Bharaṇī (35, 39, 41 Arietis), (3) Kattikā (Pleiades), (4) Rohiṇi (Hyades), (5) Magasira (λ, ϕ Orionis), (6) Addā (α Orionis), (7) Punabbasu (Gemini), (8) Phussa or Tissa (θ, δ, γ Cancri), (9) Asilesā (ϵ, δ, σ, η, ρ Hydræ), (10) Maghā (Regulus), (11) and (12) Pubba- and Uttara-phagguni (δ, θ, β, 93 Leonis), (13) Hattha (δ, γ, ϵ, α, β Corvi), (14) Chittā (Spica), (15) Sāti (Arcturus), (16) Visākhā (Libra), (17) Anurādhā (δ, β, π Scorpionis), (18) Jeṭṭhā (Antares), (19) Mūlā (λ Scorpionis, etc.), (20) and (21) Pubba- and Uttara-asālha (δ, ϵ, σ, ζ Sagittarii), [(22) Abhiji (Vega)], (23) Savaṇa (Aquila), (24) Dhaniṭṭhā or Saviṭṭhā (Delphini), (25) Satabhisaja (λ Aquarii, etc.), (26) and (27) Pubba- and Uttara-bhaddapadā or -poṭṭhapadā (the square of Pegasus), (28) Revati (ζ Piscium, etc.).[10]

No. 22 in this list is not in the *Abhidhānappadīpikā*. It was early omitted in Hindu astronomy, but the existence of Abhiji (Skr. Abhijit) in the Buddhist system may be inferred from the statement that the number of *nakṣatras* is 28[11] and from the existence of Abhijika as a proper name.[1] It also occurs in *Mahāvyutpatti*, 165, and in the list of Rémusat.[2]

References to other fixed stars than *nakṣatras* are rare in all Indian literature. The descent of the Heavenly Ganges, a myth relating to the Milky Way, is referred to in the canon, but never in any astronomical connexion. In *Jātaka*, vi. 97, seven sages are mentioned, but their names are not those which Hindu mythology gives to the seven *ṛṣis*, after whom the seven stars of Ursa Major are named. The name Sakaṭa, 'the cart,' in *Dīgha*, ii. 234, is probably a name of Rohiṇī, as suggested by S. Konow.[3] It is so named by several Hindu astronomers.[4]

5. Months.—The moon in the course of a year may be full in any of the *nakṣatras*, and we find such expressions as *Visākhapuṇṇamā*, 'full-moon when the moon is in Visākhā'; but there had been established earlier than Buddhism a system of twelve lunar months, with names derived from certain of the *nakṣatras*. These are:

(1) Chitta (Mar.–Ap.), (2) Visākhā (Ap.–May), (3) Jeṭṭha (May–June), (4) Asālha (June–July), (5) Sāvaṇa (July–Aug.), (6) Poṭṭhapāda (Aug.–Sept.), (7) Assayuja (Sept.–Oct.), (8) Kattika (Oct.–Nov.), (9) Māgasira (Nov.–Dec.), (10) Phussa (Dec.–Jan.), (11) Māgha (Jan.–Feb.), (12) Phagguna (Feb.–Mar.).

These names were later applied in Hindu systems also to the twelve solar months, but in the canon the reckoning appears to be always lunar, as well as in the Ceylon chronicles.

The month is divided into two parts (*pakkha*), the dark (*kāḷa*) from full to new moon, and the light (*sukka, juṇha*) from new moon to full. Whether the month ended with full or new moon is not clear, but the fact that the dark half is mentioned first and that the months of Retreat began the day after a full-moon day and ended on a full-moon day, suggests that the full-moon day was the end. Both methods were in use by the Hindus in Vedic times, as they are at the present day.[5]

6. The week.—The division of the half month at the eighth and fourteenth or fifteenth day easily led to the reckoning of seven days as a usual period (*sattāha*), but there is no trace in the Pāli writings of the system (no doubt non-Indian in origin) of naming the week-days from the names of the sun, moon, and planets. These names occur in the order of the days of the week as the first seven of the nine planets in *Mahāvyutpatti*, 164.

7. The year.—In *Aṅguttara*, i. 213, where the length of a year of the gods is given, it is said to be a year of twelve months, the month being made up of 30 nights (and days). This gives a year of 360 days, and is the exact number in use in the Vedic period.[6] The number 30 is probably obtained by adding together the 15 days of each half of the lunar month. In practice the number would be sometimes 29 and sometimes 30, as the synodic lunar month is rather over 29½ days. There must have been a mode of intercalating months to bring the lunar months and solar year into harmony from time to time, as in the case of the Hindu systems, but the process is unknown. The modern Siamese have a year of 354 days, the months being alternately of 29 and 30 days. In every third or second year (seven times in 19 years) the eighth month is reckoned twice, and in every fifth or sixth year one day is added to the seventh month, bringing the lunar year into harmony with the solar year.[7]

The Hindu systems have two modes of beginning

the year: (1) with the full moon of Kattika, (2) with the month Chitta.[1] The former is implied in the usual Buddhist reckoning of the three seasons, in which the cold season is always mentioned first.[2] This period was also the end of the Retreat, in which the annual redistribution of robes took place. The second mode of beginning the year is implied in the *Dīpavamsa* and in the list of lunar months in the *Abhidhānappadīpikā*, which begins with Chitta.[3]

8. Seasons.—The ancient Hindu seasons are three: *hemanta*, the cold season from Māgasira to Phagguna; *gimha*, the hot season from Chitta to Asalha; and *vassa*, the rainy season from Sāvana to Kattika. These dates, however, would vary from year to year through the irregularity caused by the lunar months and occasional intercalation.[4]

Dīpavaṃsa, xii. 44, calls Jeṭṭha the last of the hot months. *Vassa* in the sense of Retreat does not correspond with the rainy season, but extends over three months of that period. The Hindu subdivisions of the three seasons into five or six[5] are not found in Pāli works, but there are occasional references to autumn (*sarada*) as the early part of *hemanta* and to spring (*vasanta*) as the early part of the hot season.[6] *Mahāvyutpatti*, 253, gives the list of six, and I-tsing[7] also describes other systems of division used in various localities.[8]

9. Astrology.—Indian astrology, as the science of omens drawn from celestial phenomena, is a branch of divination. It is stigmatized in *Dīgha*, i. 10, as a base science and false means of livelihood. In the *Sutta Nipāta*, 927, the monk is forbidden to devote himself to magic (*āthabbana*), to (the interpretation of) the dream, the sign, and the *nakṣatra*. That such a science is possible is generally taken for granted, but in the *Jātaka* there is a tendency to ridicule the belief in lucky *nakṣatras*,[9] omens,[10] names,[11] and sneezing. There is no reason to think that this sceptical attitude is primitive; it is rather the rationalizing of a single individual or of a school. The survival of the belief within orthodox Buddhism is shown in the collection of *suttas* drawn from the canonical books called the *Paritta*, which, among other formulas intended to ward off hostile powers or to win their favour, contains the two *suttas* on the eclipse of the moon and of the sun.[12]

A fragment of a MS of an astrological work in corrupt Sanskrit has recently been discovered in East Turkestan at Khotan.[13] It is shown to be Buddhist by the phraseology, as well as by the reference to the *ṛṣi* Kharuṣṭa, who makes known to the congregation the knowledge of 'nights, days, moments, planets, half-months and months.'[14] The matter is similar to that in Hindu astrological works, such as: what *nakṣatras* are effective for conception, which are causers of misfortune or success in certain undertakings. There can be little doubt that it is borrowed from some Hindu work, and, like later works of this kind, it shows the influence of Greek astronomy in the use of such terms as *hora*, and the names of the 12 signs of the zodiac (Pisces, Scorpio, etc.) along with those of the *nakṣatras*.

LITERATURE.—The sources and authorities are given throughout the article. EDWARD J. THOMAS.

SUN, MOON, AND STARS (Celtic).—**1.** Very little is known about the astrology and astronomy of the Celts. The Druids, as we learn from Cæsar (*de Bell. Gall.* vi. 14), discussed and transmitted to their disciples many questions regarding the stars and their motion. They had observed the course of the moon, and by it they regulated their calendar. Their months and years began with the sixth day of the moon (Pliny, xvi. 95, 250); they counted by nights (Cæsar, vi. 18. 2); and their cycle was one of thirty years (Pliny, xvi. 95, 250).

The discovery of the calendar of Coligny has made it possible to determine these general ideas for the Gallo-Roman period. This calendar gives a year of 354 days, divided into twelve months of twenty-nine and thirty days alternately. To establish agreement between the lunar and the solar year a month of thirty days was intercalated every two and a half years. At the beginning of every fifth year there was complete agreement between the two methods of calculation; and probably this was the occasion, as Jullian remarks, on which were offered the quinquennial sacrifices of which Diodorus speaks (v. 32. 6).

Astrology, properly so called, does not seem to have been practised by the pagan Irish. But in the 'Lives of Saints' there are to be found some superstitious practices derived from the observation of the stars. The foster-father of Columcille goes to ask a prophet when he should begin to teach the child to read. The prophet after having examined the heavens replies that he must begin immediately (*Lives of Saints from the Book of Lismore*, l. 812). Manannan mac Lir used to know by studying the sky when there would be fine weather and when bad (*Cormac's Glossary*, p. 114).

The scientific observation of stars was also in use among the ancient Irish. Loeg observes the stars to ascertain when midnight comes (*Mesca Ulad*, 13). Some treatises on Irish astronomy dating from the early Middle Ages have been preserved. They are founded on the system of Ptolemy, and seem to be translations of foreign works. The words used to denote the sun-dial are borrowed from the Latin. Yet the Irish were particularly clever at calculating dates, and in the *Saltair na Rann* it is told that every intelligent person should know the day of the solar month, the age of the moon, the flow of the tide, the day of the week, and the chief saints' festival days. Perhaps in the ancient Irish and Welsh texts there are traces to be found of the primitive Celtic calendar. The year was divided into two halves or into four periods of three months, the month being divided into two parts. The periods of time most in use were those of three nights and three days, or nine nights and nine days, while the most common cycles were those of three years and of seven years. In Armorican Brittany and in Wales the names of the complementary days which served to convert the lunar year into a solar year (Brit. *gourdeziou*, Welsh *dyddiau dyddon*) have been preserved. Several popular superstitions are attached to them. Thus a medical manuscript mentioned by O'Curry contains a list of unlucky days, and in Irish literature there are numerous examples of births delayed in order that they may take place on a lucky day, and of disasters which might have been prevented if an undertaking had not been engaged in on an unlucky day.

[14] Cf. *Dīgha*, iii. 85.

2. The Gallic god Belenos had been assimilated to Apollo as a healer rather than as a sun-god. We have no evidence of worship of the stars among the Gauls except a few dedications to the sun and the moon in Gallo-Roman inscriptions (A. Holder, *Altceltischer Sprachschatz*, 3 vols., Leipzig, 1896–1913), and the mention of the worship of an image of the sun (*AS*, 4 Sept. ii. 197 C). No conclusion can be drawn from the representation of stars on the shields of the Orange-arch, from the *rouelles* dug out in so great a number, or from the wheel that is an attribute of a Gallo-Roman god assimilated to Jupiter; for the stars may be ornaments or armorial bearings, and the wheel may be a divination-wheel or a symbol of the thunder as well as a symbol of the sun. Some customs of the ancients may be connected with the beliefs relating to the stars—*e.g.* the gathering of the mistletoe and the beginning of the years and months on the sixth day of the moon (Pliny, xvi. 250), the dread of the Asiatic Galatians during an eclipse of the moon (Polyb. v. 78).

The evidences of the worship of the sun and the moon in ancient Ireland are not numerous. The most explicit text is in the *Confessio* (§ 60) of St. Patrick, in which he alludes to worshippers of the sun. G. Keating (*History of Ireland*, ed. D. Comyn and P. Dinneen, 1902–1908, bk. i. § 12) says that one of the Dê Danann was named Mac Gréine, 'Son of the Sun,' because his god was the sun. A passage of *Cormac's Glossary* (p. 54) tells us that Irish pagans used to carve some pictures—*e.g.* that of the sun—on the altars of their idols, and Keating (ii. 11) relates that in Columcille's time a priest of Tirconnel who had set up images of the sun and the moon in the church was carried off by a devil. The king of Ulster, Loegaire, swore by the name of the elements—the earth, the sun, and the wind (W. St. Boroma, *RCel* xiii. [1892] 52 f.).

SUN, MOON, AND STARS (Chinese).—I. *INTRODUCTION.*

—The Chinese view of the sun, moon, and stars taken as a whole may be likened to a web woven of three different threads: the thread of astronomy, the thread of religion, and the thread of astrology. Astronomy means here the observation of the heavenly bodies and the truths deduced therefrom, chiefly for practical purposes. It may therefore be called 'observational' astronomy, as distinguished from what is called 'physical' or 'descriptive' astronomy, founded by Galileo after his invention of the telescope, and it may also be called 'practical' astronomy, as distinguished from what is called 'theoretical' astronomy, founded by Newton on the hypothesis of the law of gravitation. The religious view of the Chinese concerning the heavenly bodies may be called astrological, and their astrological view may be called religious in the comprehensive sense of the term. But a clear line of distinction can be drawn between them. The idea of deity or God is always present and predominant in the religious view, whereas it may be vague and even absent in the astrological view. The latter is concerned chiefly with the influences of the heavenly bodies upon men, while the former is concerned chiefly with the relation of God to men as revealed in the heavenly bodies—*i.e.* God's messages and warnings derived by means of the observation of the heavenly bodies.

The Chinese term for the study of the heavens is *tien wen*, literally 'the system (or order) of heaven.' The term is not limited to purely astronomical knowledge, but has been applied equally to astrological and religious beliefs or views concerning the heavens.

Chinese astronomy has been of much interest to many European scholars, its great antiquity being widely admitted.

'The progress of Astronomy among the Chinese,' says John Williams, 'is a subject of highest interest whether it be considered as recording observations of the heavenly bodies made by one of the most ancient and primitive races of mankind, which appears in extremely remote time to have advanced to a high degree of civilisation; peculiar, however, to itself; and which has preserved the manners and customs established by its early rulers more than two thousand years before the Christian era, in a great measure unaltered to the present day. Or whether the fact that at a period long anterior to the commencement of civilisation among the Western nations, and when almost universal barbarism prevailed among them, astronomy had been carried to a great degree of perfection by the Chinese, as manifested by their still existing records, whose authenticity is not only strongly asserted by that people, but is acknowledged by some of the most eminent European scholars of the present day.'[1]

It has been said by some of the authorities of our own century that the antiquity of Chinese astronomy is 'greater even than that of almost any other nation.'[2] But the study of the heavens in China is not pursuit of knowledge, or astronomical knowledge, for its own sake. Being a highly practical nation, the Chinese, when they seek to know anything, generally have some end or ideal in view to the attainment of which knowledge is merely a means. The present case is not an exception. Having to arrange all their religious ceremonies, social and governmental affairs, and, most important of all, their agricultural work according to the seasons, the Chinese, even at the earliest period of their history, felt the great need of a proper calendar, the formation of which required astronomical knowledge. Apart from this, there were other motives—the religious and the astrological. The latter explains itself, and the former has a double purpose. On the one hand, the Chinese sought to know the laws of the heavens, which were for them, in some sense, divine, in order to apply them to their own conduct, social as well as individual. The doctrine of the imitation of, or the conformation of men's conduct with, the laws of the heavens has been much held by Confucianists, and especially by Taoists, and can be found in most of the Chinese classics. On the other hand, as they believed the celestial phenomena to be God's revelations or warnings to men, they wanted to know them in order to re-adjust their conduct.

Both the astronomical and the religious views of the Chinese concerning the heavens are as old as their history, and it is difficult to tell which is earlier; their astrology is a later development. The Chinese term for 'astrologer' is *êrh tse* or *sing tse*, which may be translated 'the man of sun' or 'the man of stars.' According to the Chinese records, the former term did not occur until the 5th cent. B.C., and the latter is of still later date. Kepler says that astronomy is the wise mother and astrology the foolish daughter. If we may adopt this saying with a little modification, we can regard the astrology of the Chinese as the daughter of their astronomy and religion. These three different views have for thousands of years influenced the Chinese mind, and the astrological view, though the latest, has almost since its birth been the most powerful. Even at the present day among many of the Chinese astronomy has not divorced itself from religion, nor has it disowned or rid itself of astrology, as Western astronomy has since the 16th century.

II. *THE ASTRONOMICAL ASPECTS.* — The

[2] E. B. Knobel, 'Abstract of a Lecture on Chinese Astronomy,' in *Journal of the British Astronomical Association*, xix. [1908-09] 338.

Chinese are great believers in their ancient classics, so that to deal with their ancient views and beliefs is to a great extent to deal with their modern ones as well. The great antiquity of Chinese astronomy has been admitted by many of the best European scholars of both the last and the present century. According to tradition, a sort of calendar was invented by Fu Hsi (3328 B.C.) as a result of observations of the phenomena of the heavens. The reformation of the calendar and the rectification of intercalation are attributed to Hwang Ti, or the Yellow Emperor (2698 B.C.). In the record called *Ssŭ Ki* of Ssŭ Ma Chien, China's most famous historian (2nd and 1st centuries B.C.), it is recorded:

'Hwang Ti commanded Hi Ho to take charge of the observation of the sun, Yih Chang the observation of the moon, and Yu Chu the observation of the stars.'

He is also said to have brought into use the lunar cycle of nineteen years, by which the conjunctions and oppositions of the sun and moon can be calculated, and the intercalary months regulated. This was more than 2000 years before the introduction of the same system among the Greeks by the astronomer Meton.[1] *The Annals of the Bamboo Books*[2] record that at the time of the reign of Tsuan Hsu (beginning 2513 B.C.) a conjunction of the five planets was observed by the Chinese in the constellation called Yin Shih or Shih.[3] It has been carefully calculated and asserted by the French astronomer, Jean S. Bailly, that such a conjunction did take place on 29th Feb. 2449 B.C., which would be the 65th year of Tsuan Hsu's reign. In the time of the emperor Yaou (2356 B.C.) the Chinese already knew the exact, or almost exact, number of days in a year, had a way of determining solstices and equinoxes, and had in use an intercalary system and some instruments for the survey of the heavens, and the knowledge of the five planets and of the twelve zodiacal signs, and most probably of the 28 stellar divisions.

In the 'Canon of Yaou,'[4] the first book of the *Shu King* ('The Canon of History'), we read:

'Thereupon Yaou commanded He and Ho[5] to have reverence to the great heavens, and to calculate and delineate the movements and appearances of the sun, the moon, the stars, and the zodiacal spaces; and so to deliver respectfully the seasons to the people.

He separately commanded the second brother He to reside at Ye-e, in what was called the Bright Valley, and there respectfully to receive as a guest the Rising Sun, and to adjust and arrange the labours of the Spring. "The day," he said, "is of the medium length, and the star is in Neaou;[6] you may thus exactly determine mid-spring. The people begin to disperse; and the birds and beasts breed and copulate."

He further commanded the third brother He to reside at Nankeaou, and arrange the transformations of the summer, and respectfully to observe the extreme limit of the shadow. "The day," said he, "is at its longest, and the star is Ho;[7] you may thus exactly determine mid-summer. The people are more dispersed; and the birds and beasts have their feathers and hair thin, and change their coats."

He separately commanded the second brother Ho to reside in the west, in what was called the Dark Valley, and there respectfully to convoy the setting sun, and to adjust and arrange the completing labours of the autumn. "The night," he said, "is of the medium length, and the star is Hiü;[1] you may thus exactly determine mid-autumn. The people begin to feel at ease; and birds and beasts have their coats in good condition."

He further commanded the third brother Ho to reside in the northern region, in what was called the Sombre Capital, and there to adjust and examine the changes of the winter. "The day," said he, "is at its shortest, and the star is Maou;[2] thus you may exactly determine mid-winter. The people keep their cosy corners; and the coats of birds and beasts are downy and thick."

The emperor said, "Ah! you, He and Ho, a round year consists of three hundred, sixty, and six days.[3] By means of an intercalary month do you fix the four seasons, and complete the determination of the year. Thereafter, in exact accordance with this, regulating the various officers, all the works of the year will be fully performed."'

In the 'Canon of Hsun,' the second book of the *Shu King*, it is recorded that, having accepted the throne which had been often offered to him by the emperor Yaou, the emperor Hsun examined the gem-adorned sphere and the gem transverse tube in order to regulate the seven directors or planets.

Both the commandment of Yaou and the examination of Hsun are supposed to have taken place at the beginning of their reigns. The observation of the heavens then must have been of great importance. According to another book of the *Shu King*, called 'The Punitive Expedition of the Prince Yin,' in the reign of King Tsung Kang (2159–2146 B.C.) there were astronomers who failed to foretell an eclipse of the year 2158 B.C. (?), and it was considered such a great crime that the prince of Tin, who was then commander-in-chief of the imperial armies, received orders from the king to punish them with the imperial forces.

The Chinese then commenced their observation of eclipses from a time not later than the 22nd cent. B.C., though some European scholars regard the eclipse of the sun on 29th Aug. 775 B.C., recorded in the *Shi King* ('Book of Odes'),[4] as the earliest recorded eclipse in all history. In Ma Twan Lin's *Encyclopædia* more than 600 eclipses of the sun are recorded from 2168 B.C. to A.D. 1223. There are many other kinds of heavenly phenomena which have been keenly observed by the Chinese from a very early period as well. From 611 B.C. to A.D. 21 alone comets are recorded 372 times, as shown in Williams' *Observations of Comets*. The spots of the sun were observed and recorded by the Chinese not later than A.D. 301, *i.e.* 1308 years before the assumed first discovery of solar spots by Galileo in A.D. 1610 and 1300 years before the invention of the telescope. 48 observations of solar spots, from A.D. 301 to 1205, are recorded in Ma Twan Lin's *Encyclopædia*, which was published in A.D. 1323, *i.e.* 288 years before Galileo's observation. In the same *Encyclopædia* a great number of instances of the observation of moving or shooting stars are recorded from 1122 B.C. to A.D. 1230. Meteors have been observed, and recorded by the Chinese since, as early as 1578 B.C. The *Bamboo Books* record: 'In the tenth year [of the emperor Kwei of the Hia dynasty, *i.e.* 1579 B.C.] the five planets went out of their courses. In the night stars fell like rain.' Comparing it with the year A.D. 1866, remarks E. B. Knobel, when they had the great display of meteors, the interval gave 104 periods of 33·11 years. Now Leverrier's period for the November meteor is 33·25. Thus it is hardly possible to doubt that

[3] One of the 28 stellar divisions determined by α, β, and other stars in Pegasus, extending north and south from Cygnus and Piscis Australis and east and west 17° and comprising part of Capricornus and Aquarius.

[4] Legge, *Chinese Classics*, vol. iii. pt. i. [1865] pp. 15–27.

[5] Names of two families which had been hereditary officers of the Board of Astronomy since the time of Hwang Ti.

[6] Neaou is a space of heavens extending over 112° and embracing the seven constellations of the southern quarter. The star in Neaou is, according to the view held by Chinese scholars and adopted by many Western scholars, such as James Legge, John Williams, etc., the star Tsun Hwuo, corresponding to Cor Hydra. After an elaborate calculation Williams says (p. xi) that that star should culminate at sunset on the day mentioned in the *Shu King*. He then says: 'Thus a strong presumptive proof is again afforded of the veracity of the Chinese history as recorded in the *Shu King*.'

[7] The central star of the seven constellations of the eastern quarter, corresponding to the heart of Scorpio.

[1] The central star of the seven constellations of the northern quarter, corresponding to β Aquarii.

[2] The culminating star of the seven constellations of the western quarter, corresponding to the Pleiades.

[3] 'When it it said,' says the editor of Yung Ching's *Shu King* (James Legge's tr.), 'that the year consists of 366 days, we are to understand that Yaou was speaking in round numbers. The period in question is now called the value of the years. It has been differently estimated by the astronomers of successive dynasties.'

[4] II. iv. 9; Legge's tr., London, 1876, p. 229 *f.*

we have here the earliest record of a shower of those meteors.[1]

III. *DIVISION OF THE STARS.*—1. The 28 siüs or shĕs.—In common with the Hindus, Arabs, Babylonians, Persians, and Copts, the Chinese have the division of the ecliptic into 28 mansions, which are called *siüs* or *shĕs*. According to the interpretation of Ssu Ma Kuang, a great scholar of the Sung dynasty (A.D. 960–1279), *shĕ* has the meaning 'to reside (or to stop) somewhere' and *siü* means 'an abode,' and both words express the idea of the sun, the moon, and the five planets in their revolution residing in turn in the divisions of the sphere indicated as the 28 abodes. This meaning is very similar to that of the Hindu *nakṣatras* ('stars' or 'asterisms') and the Arabian *manāzil al-kamar* ('lunar mansions'). There is, according to Knobel's calculation, a concordance of the determinants of the *siüs*, the *nakṣatras*, and the *manāzils* in fifteen divisions, of the *siüs* and the *nakṣatras* in four divisions, of the *siüs* and the *manāzils* in five divisions, and of the *nakṣatras* and the *manāzils* in four divisions. This remarkable resemblance attracted the attention of many Western scholars and seemed to them a sufficient reason for presuming that all three systems sprang from a single source. The conclusions arrived at are different. Some hold that the system originated in India and the Chinese borrowed it from there; others are of opinion that the Chinese borrowed from the Arabs; another opinion is that the Babylonians were the originators; while still others say that the origin is to be found in Central Asia or some part of Persia. Unfortunately none of these conclusions is supported by satisfactory evidence.

But there are differences as well as resemblances between these three systems, and the Chinese division has its own peculiarity. The Chinese divisions are very unequal in the angular intervals and therefore cannot present the daily stations of the moon, as the Hindu divisions do. They are measured on the equator rather than on the ecliptic. According to G. Schlegel,[2] there is no connexion at all between the Chinese asterisms and the lunar zodiac. Some of the names of the 28 *siüs* were known to the Chinese as early as the time of the emperor Yaou (2356 B.C.), while the earliest Babylonian record concerning the lunar mansions and the earliest Hindu record of the *nakṣatras* named after the Vedic deities are much later than that.[3]

The *nakṣatras*, in their recent forms at least, are apparently assimilated to the Chinese *siüs*, and the whole system of junction stars is undoubtedly an imitation of them.[4]

J. B. Biot and his son were the first to demonstrate the identity of the Chinese *siüs* and the 28 lunar mansions of the Hindus and Arabs. They concluded that this arrangement of celestial divisions was invented by the Chinese and borrowed from them by the Hindus and Arabs for purely astrological purposes.

'To this day,' says J. J. M. de Groot, 'no considerations of importance have cancelled these views [of Biot], and though they have been rigorously combated by Weber, Max Müller, and other authorities of renown, yet it seems that most investigations of oriental astronomy silently subscribe to them.'[5]

[1] *Journ. of the British Astronomical Association*, xix. 337–345.
[2] *Uranographie chinoise*, The Hague, 1875.
[3] *Observatory*, xxxii. [1909] 187.
[4] According to Agnes M. Clerke's art. 'Zodiac' in *EBr*[11], the *siüs* were of Chinese invention and the *manāzils* were of Indian derivation. The *nakṣatras* in their recent organization were, as far as possible, assimilated to the Chinese *siüs*. 'The whole system of junction stars,' she says, 'was doubtless an imitation of the *sieu*; the choice of them by the Hindu astronomers of the 6th century A.D. was plainly instigated by a consideration of the Chinese, compiled with a widely different intent.'
[5] *The Religious System of China*, Leyden, 1892–1910, bk. i. vol. iii. p. 974, footnote.

2. The twelve kungs.—Besides the division of the lunar cycle into 28 unequal mansions, the Chinese, in common with the Hindus and Western nations, divide the zodiac into twelve equal parts as follows:

(1) Ta Liang, Aries–Taurus; (2) Hsi Chen, Taurus–Gemini; (3) Tsun Hseo, Gemini–Cancer; (4) Tsun Go, Cancer–Leo; (5) Tsun Vi, Leo–Virgo; (6) Hseo Sing, Virgo–Libra; (7) Ta Ho, Libra–Scorpio; (8) Ssi Mu, Scorpio–Sagittarius; (9) Sing Ki, Sagittarius–Capricorn; (10) Huan Hio, Capricorn–Aquarius; (11) Tsu Tsu, Aquarius–Pisces; (12) Hiang Lo, Pisces–Aries.

These names are found in Chinese books written several centuries B.C.—*e.g.*, *Tso Tsuan*, *Êrh Ya*, etc. The Hindu zodiac signs, which are probably of Greek origin, entered China at a much later date.

3. The four quarters and the five kungs.—The Chinese divide the heavens into four quarters. The eastern quarter is called Tsang Lung ('the Blue Dragon') and is associated for astrological purposes with the season of spring, the planet Jupiter, the element wood, the colour blue, the taste sour, and the virtue of benevolence. The southern quarter is called Chü Niaou ('the Red Bird') and is associated with the season of summer, the planet Mars, the element fire, the colour red, the taste bitter, and the virtue of propriety. The western quarter is called Pe Hwu ('the White Tiger') and is associated with the season of autumn, the planet Venus, the element metal, the colour white, the taste hot, and the virtue of righteousness. The northern quarter is called Hsüan Wu ('the Black Warrior,' or 'the Black Tortoise,' as it has also been interpreted) and is associated with the season of winter, the planet Mercury, the element water, the colour black, the taste salt, and the virtue of wisdom.

In Ssŭ Ma Chien's *Ssŭ Ki* the stars are divided into five *kungs*, or palaces—middle palace, eastern palace, southern palace, western palace, and northern palace. The middle palace consists of the northern circumpolar stars, and the other four are like the four quarters stated above. This system of division is followed by Pan Ku in his *History of the Later Han Dynasty*.

4. The three yuans and the two kuans.—The three *yuans* (palaces or stellar spaces) are (1) Tsu Vi Yuan (the Middle Palace), consisting of the northern circumpolar stars, (2) Tai Vi Yuan (the Upper Palace), consisting of stars in Leo, Virgo, Corvus, etc., and (3) Tien Ssu Yuan (the Lower Palace), bounded by two chains comprising Hercules, the upper part of Ophiuchus, etc.

The two *kuans*, or kinds of officers, are (1) *tsung kuan*, the internal officers, consisting of groups of stars inside the equator, and (2) *wusi kuan*, the external officers, consisting of groups of stars outside the equator.

This system of the division of the heavens is peculiarly Chinese and is very ancient. In the *Tien Wun*, consisting of eight chapters, written by Wu Hian, an astronomer of the Yin (or Shang) dynasty (1766–1122 B.C.), the astronomer assigned to the Middle Palace four seats or officers, consisting of eight stars, to the Upper Palace one seat, consisting of one star, to the Lower Palace four seats, consisting of eight stars, to the internal officers five seats, consisting of 24 stars, and to the external officers nineteen seats, consisting of 93 stars. In the *Tien Wen Sing Chan*, written by Kan Te, an astronomer of the state of Tsi, and the *Tien Wen*, written by Hsi Hsen, an astronomer of the state of Wui (both astronomers lived about the 4th cent. B.C.), the method of division is identical with that of Wu Hian, but the numbers of officers and stars are greatly increased. Adding these estimates together, we get 283 officers, consisting of 1464 stars.

5. The three yuans and the 28 siüs.—There is a

popular book consisting of 31 songs by Tan Yuan Tsu of the Sui dynasty (589–617), called *Pu Tuen Ko*. It divides the stars into three *yuans* and 28 *siüs*. There are in all 193 *kuans*, or officers, consisting of 1457 stars. The stars which have been named by the Chinese are not many more than this, except in the book of Chang Heng, which gave 320 *kuans*, consisting of 2500 stars, and, besides these, 11,520 stars. This system of division is followed by Ma Twan Lin and others.

IV. *THE RELIGIOUS ASPECTS.*—**1. Animistic view.**—The animistic view which the Chinese took of many things in nature is seen in their attitude to the sun, moon, and stars. Many of them regard the heavenly bodies not as merely inanimate bodies, but as dwelling-places of spiritual beings or as spiritual beings themselves; *e.g.*, there is, it is said, a cock in the sun and a hare in the moon, the palace of angels; the hare is said to be sitting under a tree pounding medicine in a mortar. Those spiritual beings have superhuman powers, though the supreme power is not attributed to any of them, but to *Tien*, *Shang-ti*, or God alone. Hence the movements and appearances of the heavenly bodies are not regarded as mechanical, lifeless, or inevitable, for within or behind them there is a will which causes them. This will may be the will of the heavenly bodies, of the spiritual beings who dwell in them, or of God, the Supreme Ruler.

2. Comparison of the heavens with the earth.—In the heavens there are the sun and the moon; correspondingly on the earth there are the *yang* and the *yin*, the two contrary conceptions applied to phenomena mental and moral as well as physical. *Yang* is the male principle, associated with heat, day, etc., and *yin* is the female principle, associated with cold, night, etc. Hence the sun is called 'the great *yang*,' and the moon 'the great *yin*.' It is also said that the sun is 'the crystallization of the *yang*' and the moon 'the crystallization of the *yin*.' The five planets are said to correspond to the five elements of the earth, and therefore Mars is called 'the planet of fire,' Mercury 'the planet of water,' Venus 'the planet of metal,' Jupiter 'the planet of wood,' and Saturn 'the planet of earth.' Similarly, the different stars and constellations are believed to correspond to the various portions of the surface of the earth. In the chapter called *Tien Kwan* ('The Heavenly Officers') in Ssŭ Ma Chien's *Ssŭ-Ki*, in which all the beliefs mentioned above may be found, we read: 'The twenty-eight *siü* or constellations correspond to the twelve *chows*, or provinces. . . . The source of this (saying or belief) is of remote antiquity indeed.'

It is a popular saying in China that 'the stars of the heavens above and the configurations of the earth beneath correspond with each other.' A great number of stars—*e.g.*, the twenty stars constituting the two chains of the Tien Ssu Yuan, or the Lower Palace—are believed to correspond to certain countries in China and are given the names of those countries.

In some of the ancient books the heavens are said to be spherical and the earth square, the heavens dynamic and the earth static. There are also ancient stories or mythologies which represent the heavens as having a hollow place in the north-west round which all the stars revolve, and the earth as having a hollow place in the south-east towards which all the waters run.

3. Comparison of the heavenly bodies with men.—Heaven, earth, and men are believed to be the three great powers or genii in the universe. The heavenly bodies are regarded not merely as separate individuals, but as having a society like that of men. As the Chinese state was an empire, so the heavenly society was believed to be an empire. This can be observed in the names of the stars. The coining of significant poetical or mythological names for the heavenly bodies was probably to render easier the task of discriminating and remembering them. Many stories grew round those names, which are regarded by some as fables and by others as true. According to the names of the stars in the Tai Vi Yuan, the Upper Palace, the northern polar star (Polaris) is where the emperor is. The reason is quite plain, as Confucius said: 'He who exercises government by means of his virtue is like the northern polar star, which keeps its place, and all the other stars turn towards it.'[1] The Great Bear, or the Spoon, as it is called in China, is said to be the imperial chariot, and its motion round the northern polar star is said to be the emperor viewing his empire in all directions. Names of some of the other stars are: the Empress's Palace, Crown Prince, Prince, Princess, Guards, Civil and Military Officers, Law-Court, Prison, Armoury, Storehouse, Kitchen, Bed, Canopy, etc.

4. Relation between the heavenly and the earthly empires.—These two empires are not separated from one another without inter-communication. *Tien*, or *Shang-ti*, the Supreme Ruler, governs both, but the heavenly one more directly. The ruler of the earthly empire used to be called Tien-tsu, 'the son of Tien (or God).' Enthronement used to be regarded as the appointment of God, the rewarder of the good and the punisher of the bad. Therefore, when the Son of Heaven was good and his empire well governed, auspicious phenomena used to appear from God in the heavens, and, when he was bad and his empire in disorder, threats used to appear. There are many heavenly phenomena which are regarded as God's threats—notably eclipses. The *Canon of Odes* refers to an eclipse of the sun of the date 29th Aug. 775 B.C., which was carefully verified by John Chalmers.

> 'The sun was eclipsed—
> A thing of very evil omen,
> First the moon looked small,
> And then the sun looked small,
> Henceforth the people
> Will be pitiable indeed.
> The sun and moon presage evil
> By not keeping to their proper paths;
> All through the kingdom there is no [good] government,
> Because good men are not employed.
> For the moon to be eclipsed
> Is a small matter,
> But now the sun is eclipsed,
> How dreadful is that!'

In the Confucian classic called *Tsun Tsiu* ('Springs and Autumns') the eclipse of the sun which took place on 20th April 610 B.C. is recorded. The writer says:

> 'On the occasion of an eclipse of the sun, the Son of Heaven should not have his table spread so lavishly as usual, and should have drums beaten at the altar to the spirits of the land, while the feudal princes should present offerings of silk to the spirits of the land and have drums beaten at their courts, thus manifesting their own service of the spirits and so teaching the people to serve their rulers, according to the respective rights of each, as was customary in ancient days.'

The word 'eclipse' used here is the same as the word 'eat.' The eclipse of the sun or the moon is described, in some of the Chinese stories, as the sun or moon being eaten by a certain animal, and the beating of drums is said to frighten the animal away.

The sun in the heavens is also said to correspond to the ruler on the earth; *e.g.*, when the people wished the death of Kie, the tyrant (reigned 1818–1753 B.C.), they said: 'O sun, why expirest thou not? Let us die together with thee.' Therefore the eclipse of the sun is generally regarded as a threat from God to the emperor. There are

[1] *Analects*, bk. ii. ch. 1.

numerous examples, and the edict of the emperor Ming Ti (A.D. 227–239) after the eclipse of the sun in 233 is most illuminating:

'We have heard,' says the emperor, 'that if a sovereign is remiss in government, God terrifies him by calamities and portents. These are divine reprimands sent to recall him to a sense of duty. Thus, eclipses of the sun and moon are manifest warnings that the rod of empire is not wielded aright. Ever since We ascended the throne, Our inability to continue the glorious traditions of Our departed ancestors and carry on the great work of civilization has now culminated in a warning message from on high. It therefore behoves Us to issue commands for personal reformation, in order to avert impending calamity. The relationship, however, between God and man is that of father and son; and a Father, about to chastise his son, would not be deterred were the latter to present him with a dish of meat. We do not therefore consider it a part of Our duty to act in accordance with certain memorials advising that the Grand Astrologer be instructed to offer up sacrifices on this occasion. Do ye governors of districts, and other high officers of State, seek rather to rectify your own hearts; and if anyone can devise means to make up for Our shortcomings, let him submit his proposals to the throne.'[1]

Comets, even more than eclipses, are regarded as God's threats. When the comets appeared in 524 B.C., travelling eastward towards the Milky Way, an officer said: 'This is a broom to sweep away the old, and give us new. God often makes us such signs. The feudal princes will suffer from calamities by fire.'[2] The stars or the spiritual beings who dwell in them sometimes descend from the heavens, either by themselves or by the will of God, are born on earth, and go back to their positions in heaven after their earthly life.

In *The Annals of the Bamboo Books* there are the following legends:

'He's mother (the mother of Hwang Ti, 2968 B.C.) was called Tu Paon. She witnessed a great flash of lightning, which surrounded the star Chu (or Dubhe) of the Great Bear with a brightness that lighted all the country about her, and thereupon became pregnant.'

'His mother was called Niu Tsie. She witnessed a star like a rainbow come floating down the stream to the islet of Hwa. Thereafter she dreamed and received it, and was moved in her mind, and bore *Shaon-Haon* [the emperor Che, 2597 B.C.].'

'His mother was called Niu Chu. She witnessed the *Yaou Kwang* star (or Bemtuash) go through the moon like a rainbow, when it moved herself in the palace of Yio-Fang, after which she brought forth *Tsun Hu* [the emperor, 2513 B.C.].'

'His mother was called *Sis-Ki*. She saw a falling star which went through the constellation Maou, and in her dream her thoughts were moved till she became pregnant, after which she swallowed a spirit's pearl, . . . and gave birth to *Yu* (king 2205 B.C.) in Shih Nio.'

There are 28 heroes in Chinese history who were believed to be the 28 *siüs*, or constellations, descended. A great man on earth may become after death a spiritual being in heaven and dwell in one of the stars. Some stars are named after historical heroes. There are a great many stories, love stories, and mythologies based upon beliefs of this kind.

5. **Sacrifices.**—We read in the 22nd book called *Ki Tung* ('The Foundation of Sacrifices') of the *Li Ki* ('The Book of Rites'), a collection of treatises on the rules of propriety or ceremonial usages, one of the five Confucian books or canons:

'Of all the methods for the good ordering of men, there is none more urgent than the use of ceremonies. Ceremonies are of five kinds, and there is none of them more important than sacrifices.'[3]

Among various sacrifices there are sacrifices to the sun, moon, and stars. We do not know when these rites began, but they have been performed under each dynasty from the 23rd cent. B.C. down to the time of the present Republic of China. In the 20th book of *Li Ki*, called *Ki Fâ* ('The Laws of Sacrifices'), it is said:

'With a blazing pile of wood on the Grand altar they [the Emperors, from Emperor Shun 2255 B.C. to King Wu 1122 B.C.] sacrificed to Heaven;[4] by burying (the victim) in the Grand mound, they sacrificed to the Earth. (In both cases) they used a red victim.[1]

By burying a sheep and a pig at the (altar of) Great brightness, they sacrificed to the seasons. (With similar) victims they sacrificed to (the spirits of) cold and heat, at the pit and the altar, using prayers of deprecation and petition; to the sun, at the (altar called the) royal palace; to the moon, at the (pit called the) light of night; to the stars at the honoured place of gloom; to (the spirits of) flood and drought at the honoured altar of rain; to the (spirits of the) four quarters at the place of the four pits and altars; mountains, forests, streams, valleys, hills, and mounds, which are able to produce clouds, and occasion winds and rain, were all regarded as (dominated by) spirits.'[2]

In the 21st book of *Li Ki*, called *Ki Î* ('The Meaning of Sacrifices'), it says:

'The sacrifice in the suburb of the capital was the great expression of gratitude to Heaven, and it was specially addressed to the sun, with which the moon was associated. The sovereigns of Hsiâ [dynasty, 2205–1766 B.C.] presented it in the dark. Under the Yin dynasty [1766–1122 B.C.] they did so at noon. Under the Kau [dynasty, 1122–255 B.C.] they sacrificed all the day, especially at daybreak, and towards evening.

They sacrificed to the sun on the altar, and to the moon in the hollow;—to mark the distinction between (the) gloom (of the one) and (the) brightness (of the other), and to show the difference between the high and the low. They sacrificed to the sun in the east, and to the moon in the west;—to mark the distinction between (the) forthcoming (of the former) and (the) withdrawing (of the latter), and to show the correctness of their (relative) position. The sun comes forth from the east, and the moon appears in the west; the darkness and the light are now long, now short; when the one ends, the other begins, in regular succession:—thus producing the harmony of all under the sky.'[3]

These are the sacrifices at the equinoxes; that to the sun at the vernal equinox in the eastern suburb, and that to the moon at the autumnal equinox in the western suburb. These had been performed under each dynasty, and can also be found in *Ta Tsing Tung Li* ('The Ritual of the Manchu Dynasty'). The former is called *Chow Zi*, 'The Morning Sun,' and the latter *Si Yüe*, 'The Evening Moon.'

In the dynasty of Chin (255–206 B.C.) they sacrificed to what they called the eight gods, *i.e.* the god of the heavens, the god of the earth, the god of war, the god of the *yin*, the god of the *yang*, the god of the sun, the god of the moon, and the god of the four seasons. In *Han Shu* ('the Book [or History] of the early Han Dynasty') [206 B.C.–A.D. 25] it is said: 'There were such eight gods in the ancient times, but their origin is unknown.'

In the dynasties after the China dynasty different temples were built for their sacrifices. Even at the present day temples connected with the sun, moon, and stars can be found in different places. In Peking there is the world-famous Tien Tan ('Temple of Heaven'), and in it there are altars of the sun, of the moon, of the 28 constellations, and of some other stars and groups of stars. In the Manchu dynasty (1644–1911) sacrifices were offered in the Temple of Heaven once every spring and once every autumn. Even since the establishment of the Republic of China (1911), a grand sacrifice was offered in the Temple of Heaven by Yuan Shi Kai, the first Chinese President.

The 15th of the eighth lunar month is a Chinese holiday called *Tsung Tsiu Tse* ('the mid-autumn holiday'). The moon is said to be always at its fullest and brightest on this evening if it is visible, whereas this need not be so on the same date of other lunar months. A family festival used to be, and in some places still is, held in Chinese houses on that evening. The offerings to the moon consist chiefly of fruits, and the ceremony is similar to that of Chinese ancestor-worship. On this holiday schools, shops, etc., are closed, and farmers cease work for a few days. Relatives and friends exchange presents, chiefly

eatables, and invite each other to dinner on one or more of the days following the mid-autumn holiday.

With regard to the sacrifices to the stars we read in *Urh Ya*, an ancient dictionary, one of the Thirteen Confucian Classics: 'The sacrifice to the stars is called Pu.' Even in our day tablets of stars can be found in public temples and private houses in different provinces.

6. Significance or purpose of sacrifices.—The significance of these sacrifices is not merely religious, nor is their religious significance always the most prominent. Sometimes these rites were used for political purposes by the rulers. This is the case not only in ancient times; there was a time in our present century when *Shinkio Riyo Mondai* ('The Problem of the Utilization of Religions') was of great interest to statesmen and politicians in Japan, and the political significance of the sacrifices at the Temple of Heaven performed by Yuan Shi Kai was sufficiently obvious. When the sacrifices are performed by the people, their purpose is sometimes social as well as religious. In any case the idea of keeping up the custom seems to play a great part. Western scholars are apt to take these sacrifices purely as the expression of religious faith and devotion. The following passages in *Lî Kî* may show that they are not always so.

As sacrifices are the most important of ceremonies or rites, let us first indicate the purposes for which they are offered.

'The rites to be observed by all under heaven were intended to promote the return (of the mind) to the beginning (=Creator of all); to promote (the honouring of) spiritual Beings; to promote the harmonious use (of all resources and appliances) of government; to promote righteousness; and to promote humility. They promote the return to the beginning, securing the due consideration of their originator. They promote (the honouring) of spiritual Beings, securing the giving honour to superiors. They promote the (proper) use of all resources, thereby establishing the regulations (for the well-being of) the people. They promote righteousness, and thus there are no oppositions and conflictings between high and low. They promote humility, in order to prevent occasions of strife. Let these five things be united through the rites for the regulation of all under heaven, and though there may be some extravagant and perverse who are not kept in order, they will be few.'[1]

There are two other passages, one of which indicates the objects to whom sacrifices should be offered and the other the purposes of the sacrifices.

'According to the institutes of the sage kings about sacrifices, sacrifice should be offered to him who had given (good) laws to the people; to him who had laboured to the death in the discharge of his duties; to him who had strengthened the state by his laborious toil; to him who had boldly and successfully met great calamities; and to him who had warded off great evils.'[2]

'Sacrifices were for the purposes of prayer, or of thanksgiving, or of deprecation.'[3]

The sun, moon, and stars fall under none of the above five classes except that in later dynasties some stars were sacrificed to for the power of warding off evils. With regard to the three purposes that of thanksgiving seems to be the sole motive for which the Chinese sacrificed to the sun, moon, and stars.

The Chinese were grateful to the sun, moon, and stars, and expressed their gratitude by means of sacrifices, because, says a passage: 'As to the sun and moon, the stars and constellations, the people look up to them.'[4] The phrase 'look up to' (*jan yang*) in this case has an ethical meaning, as when we speak of looking up to a great man with a view to modelling our behaviour on his. The Chinese believed that they could adjust their conduct by observing the appearances and movements of the heavenly bodies, which were regarded as God's revelation.

[1] *Lî Kî*, xxi. i. 20 (*SBE* xxviii. 219 *f.*).
[2] *Ib.* xx. 9 (*SBE* xxviii. 207 *f.*).
[3] *Lî Kî*, ix. iii. 28, in *Sacred Books of China*, pt. iii. (*SBE* xxvii. [1885] 448.
[4] *Lî Kî*, xx. 9 (*SBE* xxviii. 209).

There seem to be other reasons why the Chinese should be grateful to the sun, moon, and stars—especially to the sun for its great and various benefits—but the fact is that they attribute these benefits to *Tien*, God, rather than to the heavenly bodies themselves. Indeed their sacrifices to these bodies are sometimes an indirect way of expressing their gratitude to God.

7. Sun-worship, moon-worship, and star-worship.—Is there, or has there been, sun-worship, moon-worship or star-worship in China? The answer to this question depends upon what we mean by the term 'worship.' If by worship we mean the 'adoration, sacrifice, praise, prayer, thanksgiving, or other devotional acts performed in honour of the Supreme Being or God,'[1] it is certain that there is no such worship in China, and perhaps also that such worship has never existed there. None of the heavenly bodies is conceived by the Chinese as the Supreme Being. The Supreme Being is, for them, *Tien*, God, and God only. Nor can we find such worship in China if we take the term 'worship' to mean (1) the 'prostration which arises in presence of a superior being on whom we are absolutely dependent and whom we fear or reverence,' or (2) 'the feeling and act of worship' which 'involves primarily submission and fealty,' and 'is the attitude of the weak to the strong on whom they are absolutely dependent.'[2] The Chinese do not regard themselves as absolutely dependent on any of the heavenly bodies or on the spirits dwelling in them, but they regard the heavenly bodies or their indwelling spirits as dependent on *Tien*, 'God,' as they themselves are. It is true that they believe these heavenly bodies to possess powers which do not belong to men, but they also believe that men have powers which these bodies do not possess. What is more, some of them believe that certain men have the power of subjugating the spirits of the heavenly bodies, as magicians have the power of controlling spirits.

There are certain passages which have been regarded as evidence of sun-worship in China. In the 9th book of *Lî Kî*, called *Kiâo Teh Sĕng* ('The Single Victim at the Border Sacrifices'), a passage says:

'At the (Great) border sacrifice he [the Son of Heaven] welcomed the arrival of the longest day. It was a great act of thanksgiving to Heaven, and the sun was the chief object considered in it.'

Legge, commenting on this, says:

'The sun became for the time the "spirit-tablet" of Heaven. Fang Küeh says: "(The Son of Heaven) was welcoming the arrival of the longest day, and therefore he regarded the sun as the residence (for the time) of the spirit of Heaven. That spirit could not be seen; what could be looked up to and beheld were only the sun, moon, and stars."'[3]

The present writer need not give his own translation here, but he must point out that the idea that the sun was regarded as the residence of the spirit of Heaven is not implied either in Fang Küeh's commentary or in the text.

With reference to the passage in the book[4] on the meaning of sacrifices, namely:

'The sacrifice in the suburb of the capital was the great expression of the gratitude to Heaven, and it was specially addressed to the sun, with which the moon was associated,'

Khân Hâo, a Chinese commentator, says, according to Legge:

'Heaven is the great source of tâo (the course of nature and duty), and of all the visible bodies which it hangs out, there are none greater than the sun and moon. Therefore, while the object of the suburban sacrifice was a grateful acknowledgment of Heaven, the sun was chosen as the resting-place for its spirit (or spirits). The idea in the institution of the rite was deep and far-reaching.'[5]

[1] *The Century Dictionary of the English Language*, London, 1889, *s.v.* 'Worship.'
[2] *DPhP* ii. 822.
[3] *SBE* xxvii. 427, n. 1.
[4] *Lî Kî*, xxi. i. 18.
[5] *SBE* xxviii. 218, n. 2.

The same remark may be made on the translation of this passage, viz. that there is neither in the text nor in the commentary the idea that the sun was chosen as the resting-place of the spirit (or spirits). The ultimate purpose in both these cases was to express gratitude by means of sacrifices to Heaven, but not to the sun or the spirit of the sun. Heaven is invisible, and they thought that for the object of sacrifice something visible was required. Therefore the sun was chosen as a symbol. Neither of these two cases therefore can be regarded as an example of sun-worship. There does not seem to be any other case. Legge says concerning the last example:

'It must be borne in mind that the rites described in the text are those of former dynasties, especially of that of Kâu. I cannot bring to mind any passages in which there is mention made of any sacrifice to the sun or sun-spirit in connexion with the great sacrifice to Heaven, or Shang Tî, at the service on the day of the winter solstice in the southern suburb.'[1]

Hence it is only by taking the term 'worship' in a very comprehensive sense, and by ignoring the purpose of the sacrifices, that we may say that the fact that the Chinese sacrificed to the sun implies that they worshipped it. It is the same with regard to their worship of the moon and the stars. In whatever sense we may be justified in saying that some of the Chinese worshipped the sun, moon, and stars, such worship occupies a very insignificant position in China compared with the worship of other natural phenomena or the spirits of them. If by sun-worshipper, moon-worshipper, etc., we mean one who regards the sun or the moon as the only or the supreme object of worship, we may say with conviction that the Chinese are not, as they have never been, sun-worshippers, moon-worshippers, or star-worshippers.

LITERATURE.—See the works quoted in the footnotes.

T. FU.

SUN, MOON, AND STARS (Hebrew).—

The Hebrew conception of the universe, as we find it in the OT, is not scientific in the modern sense of the term. The cosmology of the Hebrews (see art. COSMOLOGY [Hebrew]) is characterized by the simplicity and *naïveté* of primitive folk. The attitude of mind is one of awe and wonder, not of critical inquiry; and to pry closely into the secrets of the divine government is felt to indicate a want of reverence, and even to be dangerous. Moreover, it would be natural to a people which seems to have had an innate genius for religion to think, even after it had progressed beyond the stage of quite primitive ideas of the universe, that religion itself constituted the whole of true science or knowledge.[2] We need not expect, therefore, to find in the OT any inkling of the modern science of astronomy. The Hebrew shepherds without doubt, like the Phœnician mariners (cf. Pliny, *HN* vii. 57), closely observed the sky, and learned from the scrutiny many lessons of practical value for their every-day life. It is equally likely that at an early date the Hebrews were wont to worship the stars and planets. There are later traces of this worship in the OT (cf. 2 K 17[16]).[3] And, besides this, the figures suggested by various constellations no doubt gave rise to a number of curious fables and fancies. On the other hand, the OT, as we have it, a collection of much-edited writings, preserves few traces of the astronomical and astrological lore of the Hebrews themselves. Since in the course of their national development the study of the stars and planets became more and more associated with the idolatrous practices of surrounding nations, later editors would be anxious to avoid, or even to remove, references to astronomy and astrology (cf. Dt 18[10]). This would account for the fact that most of the references preserved in the OT are of a very general nature.

The chief planets are, of course, alluded to frequently. The sun (*shemesh*) is spoken of as ruling by day (Ps 136[8]), and is often referred to as coming forth (from one chamber) in the morning and going in (-to another chamber) in the evening. Its magnificence (Jg 5[31]) and its wonderful power for good (Dt 33[14]) or for evil (2 K 4[18f.]; cf. Ps 121[6]) impressed the Hebrews, as they have impressed all peoples. Jahweh Elohim Himself might be compared to a sun (Ps 84[11]).[1] There are four words for 'moon' in the OT. *Yārēaḥ* is used especially in poetry (Gn 37[9], Jos 10[12] etc.). To this word is closely related one of the words for 'month,' *yéraḥ*, a word which is common to all the Semitic languages, though not in frequent use in the OT. Another word, *lebhānāh*, which occurs only three times (Ca 6[10], Is 24[23] 30[26]), designates the moon as the 'white one' or the 'pale one.' Rarer still is a word *kesē'* (perhaps connected with the Assyr. *kusê'u*, 'headdress' or 'cap'), which denotes the full moon (perhaps the moon-god clothed in the splendour of his tiara).[2] The most common word is *ḥōdesh*, which means 'new moon,' and also 'month.' Thus the new moon was regarded as marking a new period or month, and the use of *yārēaḥ*, *yeraḥ*, and *ḥōdesh* for both moon and month shows that among the Hebrews the month and year were lunar. The moon rules the night (Ps 136[9]), and, like the sun, is a power for good (Dt 33[14]) or for evil (Ps 121[6]). Its pale brilliance made it the emblem of beauty (Ca 6[10]). In a few passages reference seems to be made to eclipses (Am 8[9], Is 38[8], Job 9[7] etc.). And we are once told that 'the sun stood still, and the moon stayed, until the nation had avenged itself on its enemies'[3] (Jos 10[12f.]). In late writings there are several allusions to the worship of the sun (Ezk 8[16f.], Job 31[26f.]; cf. 2 K 23[5]) and moon (Dt 4[19]).

Other planets are mentioned more incidentally. Thus, in all probability, Venus[4] as the Morning Star is referred to in Is 14[12] under the name הֵילֵל, *hêlēl*, or הֵילֶל, *hêlāl* (lit. 'the glittering one'), though it should be mentioned that some expositors have seen in the term an Arabic name for the moon (هِلَال, *hilâl*). W. Lotz (*PRE*[3], *s.v.* 'Sterne') indeed argues that the Arabic word means 'new moon,' which would be unsuitable; as we find among the ancient Egyptians, Babylonians, Assyrians, and Persians. But the present writer has pointed out (*Journal of the Manch. Egyptian and Oriental Society*, 1917, pp. 67–70) that the word usually translated 'wings' will bear another meaning. The meaning may be 'skirts' rather than 'wings,' and the figure that of the glorious robe that flows from the sun.

[1] *SBE* xxviii. 218, n. 2.

[2] On this point Laurie Magnus's '*Religio Laici*' *Judaica* (1907) will be found suggestive. It has been argued elsewhere (W. Jay Hudson, *Law of Psychic Phenomena*[10], 1907) that ignorance of, or indifference to, what we term science might co-exist with a perfect knowledge of the laws of the moral and spiritual life.

[3] It is quite unnecessary to suppose that the idea of worshipping the stars and planets was borrowed, though, of course, the Hebrews came more and more into contact with people who were addicted to this worship. Whether and to what extent they came under direct Babylonian and Egyptian influence is a disputed matter (see K. Marti, *Religion of the OT*, p. 36 ff.). Cf. the proper names שַׁמְשַׁי (Jg 13[24]) and שִׁמְשַׁי (Ezr 4[8]), derived from שֶׁמֶשׁ, 'sun'; the Palmyrene ירחו, and the Biblical יְרֵחוֹ, Jericho, derived from יָרֵחַ, 'moon.' Cf. also Beth-shemesh, a place sacred to the sun-god. Commentators have seen in Mal 3[20] (4[2]) the conception of a winged solar disk such as we find among the ancient Egyptians, Babylonians, Assyrians, and Persians. But the present writer has pointed out (*Journal of the Manch. Egyptian and Oriental Society*, 1917, pp. 67–70) that the word usually translated 'wings' will bear another meaning. The meaning may be 'skirts' rather than 'wings,' and the figure that of the glorious robe that flows from the sun.

[1] In Jg 14[18], Job 9[7] the word translated 'sun' is not *shemesh*, but *ḥeres* (cf. Is 19[18], and the place-names in Jg 1[35] 8[13]). It is probable that in Jg 14[18] the text is corrupt.

[2] The name Sinai is probably derived from Sin, the name of the moon-god in Babylonian. In Ex 3[1] Sinai is described as 'the mountain of Elohim,' *i.e.* the sacred mountain. This suggests that it had long been sacred.

[3] The writer clearly intends a miracle to be understood (so C. Steuernagel in Nowack's *Handkommentar*, 1899). Other expositors (*e.g.* W. H. Bennett in 'Joshua,' *SBOT*, 1899) regard the passage as poetic and figurative (cf. Jg 5[20]).

[4] Another designation of Venus is *meleketh ha-shāmayim* מַלֶכֶת הַשָּׁמַיִם, 'the queen of heaven,' mention being made of cakes which were baked for her (Jer 7[18] 44[17. 25]).

but, according to Zimmern and Buhl's edition of Gesenius's *Lexicon* (*Handwörterbuch*[14], 1905) it can denote the old moon as crescent.[1] Further, in Am 5[26] we probably have an allusion to Saturn (סִכּוּת, *sikkuth* = סַכּוּת, *sakkuth* = Assyr. *sakkut*; and כִּיּוּן, *kiyyun* = כַּיָּן, *kêvān* = Assyr. *kaivânu*).

The stars, again, are alluded to frequently in a general way; but there are a few references to particular stars or constellations, and these require special attention. The earliest of them is found in Am 5[8]. Since, however, the same terms occur, with others, in passages in the late book of Job which contain more precise references to astronomy, it is best to consider the Job passages first.

In Job 9[9], in a description of God's almighty power as manifested in the marvels of the material world, Job is represented as pointing to God as one

'Who shaketh the earth out of her place,
and the pillars thereof tremble.
Who commandeth the sun, and it riseth not;
and sealeth up the stars.
Who alone spreadeth out the heavens,
and treadeth upon the waves of the sea.
Who maketh *'āsh, kĕsīl*,
and *kīmāh* and the chambers of the south.'

The context indicates that the terms in the last two lines (עָשׁ, *'āsh*; כְּסִיל, *kĕsīl*; כִּימָה, *kīmāh*; חַדְרֵי תֵימָן, *ḥadrê têmān*) designate particular stars or constellations. We are helped, too, by the fact that three of them occur again (*kīmāh* in Am 5[8], Job 38[31]; *kĕsīl* in Am 5[8], Is 13[10], Job 38[31]; *'ayish* = *āsh* in Job 38[32]); but there is considerable uncertainty as to the correct interpretation of some at least of the terms.

1. עָשׁ, *'āsh*, or better עָיִשׁ, *'ayish*, as in Job 38[32], and better still עָיִשׁ, *'ăyush*, as suggested by the Syriac (Pesh. עיוא). In Job 9[9] LXX has Ἕσπερος, Vulg. 'Hyades'; in Job 38[32] LXX Ἕσπερος, Vulg. 'Vesper.' Modern expositors have found in the word either the Great Bear, the Pleiades, Hyades, or the Northern and Southern Crown. *'Āsh* in Job 9[9] has to be taken in connexion with the other passage, 38[32], in which, according to the Massoretic text, it is said: 'or dost thou guide *'ayish* with her young?' (וְעִישׁ עַל-בְּנֶיהָ תְנַחֵם).[2] It is noteworthy, too, that what in Arabic corresponds to the Great Bear is called *na'sh*, 'the bier,' and that the three tail stars of Ursa Major are called *banāt na'sh*, 'children of the bier' (*i.e.*, in this case, 'mourners'). It is true that no philological connexion can be established between the two words, but the Arabic phrase 'children (or daughters) of the bier' is suggestive as regards *'ayish* and her children. It might seem natural to expect to find a striking constellation like the Great Bear mentioned in Job 9, and it would be fitting that it should be assigned the first place, though it may be mentioned in passing that possibly the Hebrews thought of this constellation not as a Great Bear, but as a lioness with her young (cf. with Ewald, Arabic *'ayuth*, and see A. Dillmann's Commentary). But there is some force in the argument that *ayish* can hardly be Ursa Major, because the constellations in Job 38[31f.] are referred to on account of their meteorological importance. Some expositors, therefore (*e.g.*, M. A. Stern, Nöldeke, Schrader), have thought that *'ayish* represents the Pleiades. The great objection to this is that there is very good reason to think another Hebrew term (see below) designates that constellation. The 'children' of *'ayish* would certainly suit the Pleiades, which are sometimes represented as a hen with its chickens. But, on the other hand, the smaller stars surrounding or adjoining a star of the first magnitude might in several cases be described as its children. The Pleiades not being probable, some scholars agree with the Vulgate of Job 9[9] in thinking that *'ayish* represents the Hyades (so, *e.g.*, Hoffmann, Schiaparelli); and this view has the support of the Syriac (Pesh. עיוא).[1] Moreover, the constellation is suitable as being one of great meteorological importance. Elsewhere in Hebrew *'āsh* means 'moth.' Friedrich Delitzsch has suggested that it may have the same meaning here, since the name 'moth' (*sâsu*) seems to have been given to a star by the Assyro-Babylonians (see T. G. Pinches, in Hastings' *DB*, *s.v.* 'Astronomy'). Now, the Hyades, a great red star of the first magnitude (Aldebaran) and five stars of the fourth magnitude, resemble our letter V or the Greek Λ. And Schiaparelli points out (p. 58) that in the butterfly stage, when the moth is at rest, 'its wings are not held detached from the body, as happens with most other butterflies, but spread themselves over it in such a way as to form a cloak, more or less similar (according to the several species into which the animal can be divided) to an isosceles triangle.' The suggestion is that to the author of the passages in Job *'āsh* meant 'moth,' which was a name for the Hyades. In that case, assuming the identity of *'āsh* and *'ayish*, the 'children' of *'ayish* would be the minor Hyades which surround Aldebaran. Against this it might be urged that it is easier to explain *'āsh* as short for *'ayish* than to account for *'āsh* as the original form, and that 'moth' does not seem a likely name for a constellation (especially the Hyades, apart from its form). The question of identification cannot be decided definitely. But, as the Pleiades has to be excluded (see below), there are reasons for thinking that either the Great Bear or the Hyades is intended. The Great Bear was no doubt as well known to the Hebrews as to other ancient peoples; but it would not be in the least surprising to find no mention of it in the OT, the references to astronomy being so few.

2. כְּסִיל, *kĕsīl*, usually translated 'fool.' In Job 9[9] LXX has Ἀρκτοῦρος, Vulg. 'Orion'; in 38[31] LXX Ὠρίων, Vulg. 'Arcturus'; in Am 5[8] LXX omits, Vulg. 'Orion'; in Is 13[10] (כְּסִילֵיהֶם, their '*kĕsīlīm*') LXX Ὠρίων, Vulg. 'splendor earum.' Some of the Rabbis of the Middle Ages (Saadya, Abulwalid, and others) identified the word with the Arabic *Suhaïl* and interpreted it in its later sense, Canopus. The preponderating view of the versions is in favour of Orion, a constellation which was popularly thought of as a giant who was bound in chains to the sky. *Kĕsīl* occurs elsewhere in Hebrew with the meaning 'dullard' or 'fool,' and modern expositors commonly think of the giant (Orion) as a fool in the sense of an impious person who had rebelled against God. But the Arabic equivalent of the root (كسل, *kasala*) means 'to be thick, plump,' which suggests that *kĕsīl* itself need not mean anything more than giant (the big, burly one); and, as Cheyne says (art. 'Orion' in *EBi*), *kĕsīl* ought not to be confounded with *nābāl* ('fool' in the sense of impious person). In Job 38[31] there seems to be a reference to some myth current among the Hebrews, the giant being spoken of as bound with cords; but what exactly the myth was is quite uncertain. In Am 5[8] *kīmāh* (see below) and *kĕsīl* are again mentioned together ('seek him that maketh *kīmāh* and *kĕsīl*, and turneth black darkness into morning,' etc.) as well as in Job 38[31] ('Dost thou bind the bands of *kīmāh*, or loose the cords of *kĕsīl*?'). Further, in Is 13[10] we find the curious expression 'their *kĕsīlīm*' (often translated 'the stars of

[1] P. Jensen, however, thinks (*JE*, *s.v.* 'Astronomy') that there is little ground for supposing that any star or planet is referred to; the reference in Isaiah is too vague.

[2] For תְּנַחֵם, however, it is better to read תְּנַחֲמֶנָּה ('and dost thou console *'ayish* for her children?'). See, further, below.

[1] It seems certain that the Syriac word does denote the Hyades or the chief star of the group (cf. Barhebræus).

heaven and the Orions thereof').[1] This seems to indicate that primarily *kĕsīlīm* was used to denote stars of the first magnitude, in distinction from lesser stars (*kōkābīm*). In any case it is pretty generally agreed that *kĕsīl* represents Orion. It is one of the most brilliant constellations, and did not fail to arrest the attention of the ancients.

3. כִּימָה, *kīmāh*, literally 'a group, cluster,' cognate with Arabic *kâma* (كَامَ), 'to heap up.' In Job 9[9] LXX has Πλειάς, Vulg. 'Arcturus,' Pesh. and Targ. כִּימָא; in 38[31] the renderings of the Versions differ only to the extent that the Vulg. has 'Pleiades'; in Am 5[8] LXX omits, Vulg. has 'Arcturus,' Pesh. and Targ. כִּימָא. Most of the ancient authorities, in fact, understand the Pleiades by *kīmāh*. Several modern expositors, however, prefer to think of Sirius (*e.g.*, G. Hoffmann). But the word itself suggests that we are to look for a compact cluster of stars, and, of course, we must seek for one that early attracted attention. The Pleiades, as Schiaparelli says, is the best known of such clusters, 'and also the only one which has in consequence of its conspicuous light awakened universal attention at every time and among all peoples' (p. 62).[2] The expression 'the bands of *kīmāh*' in Job 38[32] is no doubt to be understood metaphorically.[3] The Arabic name for the Pleiades, *thurayya*, also means 'cluster,' and Bar Ali mentions it as an explanation of *kīmāh*. The word *kīmāh* itself has also been connected with the Arab. *kūmat*[un], 'house,' and the Assyr. *kimtu*, 'family.' In either case the name would suit the Pleiades.

It should be noted, further, that, according to some ideas found in the Talmud (*B*[e]*rakhōth*, 58*b*; *Rosh ha-shanah*, 11*b*), God brought the flood by causing *kīmāh* to set instead of rise in the morning, and by removing two stars from it. This is given as the explanation of Rabbi Joshua. According to R. Eliezer, the changes took place at a season when *kīmāh* is wont to set in the morning, and what God did was to make *kīmāh* rise in the morning on the day in question and lose two stars. This caused the flood. According to Stern, the dates mentioned suit exactly the morning rising and setting of the Pleiades, and seem to prove that in the time of Rabbi Joshua and Rabbi Eliezer (beginning of 2nd cent. A.D.) the Jews identified the Pleiades with *kīmāh*. It is further represented in the Talmud (*ib.*) that God afterwards set things right by taking away two stars from '*ayish* to diminish its rain-producing force.[4]

4. חַדְרֵי תֵמָן, *ḥadrē tēmān*, lit. 'chambers of the south.' The LXX renders ταμεῖα Νότου, Vulg. 'interiora Austri.' We seem to require mention of another definite constellation. This has given rise to the suggestion that the phrase designates the bright star Canopus or the constellation to which it belongs (so Stern). Other expositors regard the text as corrupt, and, emending חדר וחמן, see in the first word some uncertain constellation, and in the second (תאמן=תמן) Gemini, 'the Twins.' But we are not obliged to find in *ḥadrē tēmān* a special constellation. 'Chambers (or store-houses) of the South' might, as K. Budde says ('Hiob,' in W. Nowack's *Handkomm. zum AT*, 1896), denote a whole group of constellations in the southern sky. Dillmann (*loc. cit.*) thinks that the author of Job cannot have known anything of the stars of the southern hemisphere, but that it was known to him, as one who had travelled, that the farther one goes south the more stars and constellations become visible. To those who dwelt in the north these were, so to say, enclosed in the inmost chambers of the vault of heaven, and were therefore invisible. This would explain the expression 'treasure-houses of the South' (cf. Pr 24[4]; Job 37[9]). The word *ḥeder*, coming from a root meaning literally 'to conceal,' in the plural would bear the meaning 'penetralia.'[1] Schiaparelli gives reasons for thinking that the reference is to the imposing constellation found on the charts of to-day 'distributed between Argo, the Southern Cross, and the Centaur'; but whether this was visible to the author of Job depends upon the date of the book, which is uncertain.

In Job 38[31f.] we find another difficult astronomical term. The passage is as follows:

'Dost thou bind the bands of *kīmāh*,
or loose the cords of *kĕsīl*?
Dost thou bring out *mazzārōth* in his season,
or dost thou lead out '*ayish* with her young?'

We have already dealt with three of the terms which occur here. We have now to consider—

5. מַזָּרוֹת, *mazzārōth*. The Vulg. has 'Lucifer'; Targ. שמרי מוליא. The word may come from זָרָה, *zārāh*, which means literally 'to scatter,' but can be applied to powder (Ex 32[20]), hair (Ezk 5[2], Is 30[20]), etc. *Mazzārōth* would then mean 'scatterers' or 'sprinklers,' the reference being to rain. On this supposition, Stern and Hoffmann understand the Hyades to be meant, since the heliacal rising of their chief star, Aldebaran, announces the season of rain.[2] Gesenius derived the word from נזר, *nāzar* (Arab. نَذَرَ), and explained it as 'astra præmonentia.' Another suggestion is that it is derived from זהר, *zāhar*, *mazzārōth* being for *mazhārōth*, and meaning the 'brilliant' stars which shine with a special lustre, the planets, either all of them or the brightest and most striking. But the word is more commonly regarded as identical with *mazzālōth* (מזלות) in 2 K 23[5], the interchange of *l* and *r* presenting little difficulty. The LXX has μαζουρώθ in both cases. In 2 K *mazzālōth* has been supposed by some expositors to mean 'the signs of the zodiac,' being apparently a loan-word from Assyr. *manzaltu* or *mazaltu*, 'station, abode (of gods),' which, again, is from *nazâzu*, 'to stand.' But in the passage in question it would be more natural to find mention of the planets, and some expositors so interpret *mazzālōth* (in Rabbinic *mazzālōth* means 'planets' as well as 'signs of the zodiac'). *Mazzālōth* would be the stars and planets regarded as 'mansions' (Assyr.) of the great gods (see *EBi*, *s.v.* 'Mazzaloth').[3]

[1] Kittel would read כּוֹכְבֵיהֶם, 'their stars.' But this is not necessary. Nor is it necessary to follow Cheyne in emending the whole of the beginning of the verse thus: עָשׁ וְכִימָה וּכְסִיל, 'the Great Bear, the Pleiades (?), and Orion.'

[2] An old English name for them is 'the seven stars' (AV in Am 5[8]).

[3] The Hebrew has מַעֲנֻדוֹת כִּימָה, *ma'dannōth kīmāh*, which AV translates 'sweet influences,' some such idea being suggested by the root as found elsewhere. It is better, however, to follow many modern expositors, and regard *ma'dannōth* as equivalent to *ma'naddōth*, 'bands' or 'fetters,' from '*ānad*, 'to bind' (so Ewald, Dillmann, Duhm, and others). It we translate 'bands,' we may think of the Oriental poets' habit of comparing the Pleiades with an ornament (Ideler, *Sternnamen*, p. 147).

[4] According to Stern, the Talmudists undoubtedly understood the Hyades by '*ayish*. May there not be references to an earlier form of this kind of legend in Job 38[31f.]? The passage might be translated thus (interchanging תקשר and תפתח in ver. 31):

Dost thou loosen the bands of the Pleiades (*kīmāh*)
or bind fast the cords of a giant (-star, *kĕsīl*)?
Dost thou lead forth the rainers (*mazzārōth*) in due season
and comfort the Hyades for its children?

The 'rainers' (from זָרָה, lit. 'to scatter') would be the stars taken from the Hyades, and are referred to in the next clause as 'its children.'

[1] Cf. A. B. Davidson, 'Job' in *Cambr. Bible*, 1893: 'probably the great spaces and deep recesses of the southern hemisphere of the heavens, with the constellations which they contain.'

[2] Stern identifies *mazzārōth* with *mazzālōth*, and would derive the latter from חָזַיל, *ḥizzīl*, 'to cause to flow.' This, again, would give some meaning equivalent to 'rain-producers.'

[3] P. Jensen (*JE*, *s.v.* 'Astronomy') says that *mazzālōth* may mean either 'planets,' 'signs of the zodiac,' or 'stations of the moon.'

It is not necessary, however, to regard *mazzārōth* and *mazzālōth* as identical. We have found reason to think that another word denotes the Hyades as a constellation. That does not prevent us from supposing that *mazzārōth* may be a further description of some of the stars in this group.[1] The word *mazzārōth* has also been identified with the Great Dog, whose chief star is Sirius. This, as the brightest of the fixed stars, and for meteorological reasons as well, everywhere attracted the notice of the ancients.

6. It should be noted further that in Job 37[9] another word occurs (מְזָרִים, *mĕzārīm*) which bears some resemblance to *mazzārōth*. The passage runs: 'Out of its chamber cometh the whirlwind, and cold out of *mezārīm*.' This word might also come from *zārāh*, 'to scatter.' On that assumption, it has been supposed to mean 'scattering' or north winds. Another suggestion, however, is that it is a corruption of the Babylonian *mišri*, 'the northern (star)' (so *EBi*, *s.v.* 'Mazzaroth'). A more recent conjecture is that of Schiaparelli (p. 69 ff.). He suggests that the correct punctuation of מורים is *mizrīm* or *mizrayim*, *i.e.* the plural or dual of a word מִזְרֶה, *mizreh*, which is referred to in Is 30[24] and Jer 15[7] as an instrument for winnowing. Schiaparelli points out that the arrangement of the stars of the Great Bear is such that they might be thought to resemble a winnowing fan. To the ancient Chinese these stars actually suggested a ladle, which, with its cavity and handle, is very like a winnowing fan. The plural *mizrīm* would indicate more than one instrument. Schiaparelli therefore thinks that the word might designate the Great Bear and the Lesser Bear; and in that case, of course, the dual *mizrayim* would be a still more suitable description. The fact that the Phœnicians used the Lesser Bear when at sea to find the direction of the north is noteworthy in this connexion. The suggestion is very ingenious. But unfortunately *mizreh* is not the term which denotes a winnowing instrument of the shape required. The word for that is *raḥath* (the other term mentioned in Is 30[24]). *Mizreh* is apparently the *midhrā* of modern Syria, a pitch-fork with six prongs, and the Great Bear can hardly be said to resemble that.

7. Some expositors have found yet another reference to astronomy in the נָחָשׁ בָּרִחַ, *nāḥāsh bārīaḥ*, of Job 26[13]. Meaning literally 'the fleeing serpent,' the words have been supposed to refer to the Dragon between the Great and the Little Bear. There is nothing in the context, however, to indicate that the author had any star or constellation in mind.

The OT contains very few definite references to astrology, though the prohibition in Dt 18[10] shows that it was practised. We can hardly say that there was no astrology amongst the ancient Hebrews, in spite of the fact that the present allusions are late and due to Assyro-Babylonian influence. In Is 47[13] (post-Exilic) we read: 'Yea let them deliver thee, the dividers (?) of heaven (הַחֹבְרֵי שָׁמָיִם), the gazers on stars (הַחֹזִים בַּכּוֹכָבִים), those who make known each new moon (מוֹדִעִים לֶחֳדָשִׁים), from the things that are coming upon thee.' The word translated 'dividers' occurs here only, and LXX has for the whole phrase *οἱ ἀστρολόγοι τοῦ οὐρανοῦ*. It has been connected with an Arabic word 'to divide' (*habara*, lit. 'to cut into large pieces'), a meaning which suits very well, since the Babylonians divided the sky for astrological purpose into signs of the zodiac. 'Those who make known each new moon' (or the 'monthly prognosticators') would be persons, like the Assyrian and Babylonian astrologers, who noted lucky and unlucky days, preparing monthly almanacs or calendars based on astrological calculations (see Cheyne, 'Isaiah,' *PB*, 1898). In Dn 5[11], according to AV, Daniel became chief of the 'astrologers' (אַשָּׁפִין) in Babylon; but the correct translation of the word is 'conjurers' or 'enchanters.'

[1] See the conjecture made above on p. 82[a], note 4.

MAURICE A. CANNEY.

SUN, MOON, AND STARS (Hindu).—1. The sun.—Solar worship has been described as the real religion of India. Nor is it difficult to understand how in a land flooded with sunshine, where every phase and function of life is dependent upon the kindly warmth of the sun and his destructive energy and power are felt in the uttermost extremes of heat, it should have been man's primary business to win his favour and placate his wrath. In the ancient verse of the *Gāyatrī* every Hindu begins his day with prayer and ascription of praise to the sun, the giver of light, heat, and fertility. In his mid-day devotion also he remembers and renders homage to the same deity. It is apparently true that at no period in India was the worship of the sun to any great extent exclusive. There are no distinct sects at the present time who reverence the sun alone and bear his name. The essentials of his worship, however, are present everywhere and in all the sects, more or less avowedly, or in disguise, and combined with other cults; and his practical and decisive influence on daily life is universally recognized.

In the *Rigveda* Sūrya, or the sun, is worshipped under many names and forms. The three chief aspects under which he presents himself to his worshipper are the rising, culminating, and setting sun. These are not separated or distinguished as three deities, but are varying forms of one and the same god, in each of which he displays himself with different attributes and as exercising different powers. Especially is he reverenced as Savitṛ, the giver and sustainer of life, who each morning wakes the universe and men from sleep. One of his most ancient cults, perhaps the most ancient of all, is under the name Mitra, the Persian Mithras; whence some have conjectured that India derived her solar religion from the West. If borrowing took place on either side, it is probable that in those early days the indebtedness was Persian. As Mitra, the sun was associated as a member with an early triad, symbolized by the sacred syllable *Om*, Agni or fire, Vāyu the wind, and Mitra. This triune aspect also was manifested in the sun as the heavenly fire, and he bore corresponding epithets or titles, as *tripād*, 'three-footed,' *trivikrama*, 'three-stepping,' and others. The last name was appropriated more particularly to Viṣṇu, the sun as the all-pervader, who in three strides traverses the three worlds, earth, heaven, and hell. He is invoked also as Pūṣan, the guardian and preserver of the cattle, the companion of travellers, and guide of the soul on its perilous way to the lower world.

In the mythology Sūrya is the son of Dyaus, the wide-spreading sky, and is described as 'all-creating' and 'all-seeing.' In this aspect his most ancient and significant name is Prajāpati, the 'lord of creation.' He traverses the heavens in his golden car, drawn by seven steeds, of which Uṣas, or the Dawn, is the charioteer; and the Aśvins, twin gods of the morning, are his children. By his power he drives away the demons of sickness,

and expels diseases and all the subtle and dreaded influences of darkness. The beneficent offices of physician and healer of bodily ills, which later are ascribed to the Aśvins, are in the first instance those of Sūrya himself.

There seems no reason to reject or doubt the statement of Śaṅkara in the 10th cent. that in his time there existed distinct sects of sun-worshippers, Sauryas, of one at least of which the members were accustomed to carry branded on their forehead and breast the symbol of their deity. They have, however, all died out and been forgotten.[1]

Not many temples dedicated to the worship of the sun have survived, nor is it probable that at any period in Indian history they existed in any considerable number. That at Konārak in Orissa is the best known, and architecturally of the most interest. It is, however, neglected and ruinous, and attracts no worshippers. There is another at Gayā, and a small but much-frequented shrine at Benares, where the fire-sacrifice is offered in honour of the sun.

Among the non-Aryan peoples of India and the sub-tribes, who may be described as on the borders of Hinduism, sun-worship is much more open and confessed. By the Dravidians and Kolarians the sun is widely invoked as Parameśvar, the creator and preserver, and is worshipped with prayer and sacrifice. The most popular form of offering is a white cock, whose head is struck off at the village shrine. He is Sūrāj Nārāyan (Sūrya-Nārāyaṇa), and the traders in the bazaars draw images or symbols of the sun at the entrance to their booths for good luck.[2] Similar representations or figures may be often seen on pillars. The *nīm*-tree is especially sacred to the sun, and there exists a popular legend or story which records its association with his cult. By many the *Holī* festival in the south of India is believed to have been instituted originally in order to propitiate the sun-god. He is invoked also to avert or to heal disease, and on the occasion of an eclipse the tom-toms are beaten and other ceremonies observed to rescue the deity from the powers of evil. The same conception, that worship and sacrifice are efficacious to avert disaster from the object of worship, may perhaps be recognized in the especial frequency of sun-ritual and adoration in the winter season among some northern tribes, at a time when the divinity may be supposed to be weak. A sacred meal is partaken of in his honour, and this must be eaten without salt. A similar ritual is observed when the sun enters a new sign of the zodiac. There are races and peoples in India at the present time who believe themselves to be descended from the sun.

2. The moon.—From the earliest times in India it would appear that the moon has been a popular subject of traditional story and mythology, but, so far as is known, there never existed any formal moon-cult or sectarian worship. A late work of the 17th cent. mentions 'moon-worshippers' and 'star-worshippers.' It is improbable, however, that any special sect was in the writer's mind. Worship of the moon in one or other of her aspects, either alone or in conjunction with other rites, is common in India at the present day, and such worship has in all probability never been intermitted. There are, however, no exclusive votaries or sects who make the moon their chief deity. In this respect, therefore, the popular worship of India is in contrast with the established cults of ancient Babylonia and other countries.

In the *Rigveda* and the early literature Soma (*q.v.*) is identified with the moon, and in one passage at least the waning of the moon is caused by the gods drinking up the nectar (*amṛta*).[3] The great deities Indra and Agni are identified with its phases, representing the new and full moon respectively; so also Varuṇa and Mitra are deities of the waxing and waning moon.[1] As usual among primitive peoples, the moon is a male divinity. A title of Śiva is *chandra-śekhara*, 'he whose crest is the moon,' *i.e.* the moon-bearer, and in this sense he is contrasted with Viṣṇu, who represents the sun. The ancient lunar dynasty of India (*chandravaṁśa*), whose capital was at Hastināpura, or Delhi, about 50 miles north-east of the modern city, claimed descent from the moon.

The moon also (Soma) was one of the treasures recovered at the churning of the ocean, together with the *amṛta* (nectar). Elsewhere he is enumerated among the eight *lokapālas*, or guardians of the universe. He is lord of the planets and of plants, of offerings and of penances.[2] More often he is regarded as one of the nine planets and is associated with them in worship, but especially with the sun. The departed go to the moon, and there is the abode of the *pitṛs*, 'fathers,' whither they are borne on the smoke of the funeral pyre. A more popular title or a more popular ritual for him is as Oṣadhipati, or Oṣadhiśa, 'lord of plants.' Agriculture in general is under his protection and is subject to his influence.

The phases of the moon are often decisive for the work of the fields; and the economy of the household, with its various anniversaries and important events, is similarly determined by the moon's position and aspects. The title 'lord of plants' is probably derived from the practice, common also in other countries, of collecting medicinal herbs, etc., by the light of the moon. In this character he is a god of healing, and for certain diseases—*e.g.*, leprosy—to gaze at the reflexion of the moon in *ghī* or oil is an important and efficacious remedy. The periods of new and full moon are especially dangerous owing to the increased activity of the spirits at these times. In some parts of the country the conch-shell is a symbol of the deity of the moon. Among some of the primitive Kolarian tribes, instead of being regarded as a male divinity, the moon is mythologically the wife of the sun, and the stars are their children.

3. The stars.—The principal stars and constellations are known to the Hindus by name, and are recognized as beneficent or the reverse, especially in their relation to family and individual happiness or misfortune.

Thus the Pole-star is *dhruva*, 'fixed' or 'stationary,' although the same title is given to some of the *nakṣatras* (see below). The seven stars of the Great Bear are seven *ṛṣis*, translated to the heavens. Canopus also is a *ṛṣi*, Agastya, the sage and reputed evangelist of S. India. The Pleiades are the six *kṛttikās*, 'nymphs,' the nurses of Skanda, the god of war, who bore from them the title of Kārttikeya. Orion represents the head of Brahmā in the form of an antelope's or stag's head (*mṛgaśiras*), struck off by Śiva, etc. Great regard is paid especially to the planets and the constellations or groupings of stars known as *nakṣatras*; and the star, planet, or constellation under which a man is born gives infallible indication of his future lot. In parts of N. India the stars generally are the cattle that the moon tends in the character of shepherd.

The full number of the planets is nine, but sometimes only seven or five are enumerated. There is a temple at Benares dedicated to the nine planets, where flowers and other offerings are presented. The complete number includes the sun and moon, and the others in order are Mercury, Venus, Mars, Jupiter, Saturn, with Rāhu and Ketu. The two last represent the ascending and descending nodes of the moon's orbit.

Rāhu is the cause of eclipses, when he swallows the sun or moon, and this he is said to do in revenge for the loss of his head, which was cut off by Viṣṇu as a punishment for his having stolen and drunk part of the nectar churned from the ocean. By drinking the *amṛta* he became immortal, and his wrath is perpetually exhibited in the eclipses, when the village folk seek to propitiate him with various rites. Rāhu is therefore known as the bodiless, and there exists at Benares a shrine dedicated to him under this form. Ketu is the progenitor of the numerous tribe of meteors and comets. In the *Purāṇas* they are all described as deities, each with his own car, that of Mars being golden with eight red horses. The days of the week also are named from them.

Some of the planets are favourable and some malevolent; but all need to be propitiated and their favour if possible secured before a marriage or other important event in the household. The omission of the *śānti* or *śānti-karman*, the 'propitiation ceremony, would most certainly result in harm and disaster.

1 See art. SAURAPĀTAS, SAURAS, or SAURYAS.
2 See art. SYMBOLISM (Hindu).
3 *Rigveda*, x. lxxxv. 5.

1 *Śatapatha Brāhmaṇa*, II. iv. 4. 17 f.
2 *Viṣṇu Purāṇa*, i. 22.

Rāhu and Ketu, with Saturn, are deities of ill omen who presage sickness and all kinds of trouble, and to be born when one of these is in the ascendant is a grave misfortune. The remaining planets are propitious, especially Mercury, Venus, and Jupiter, in whose hands are the gifts of wisdom and all knowledge and skill.

In the *Rigveda* *nakṣatra* is the name for a constellation in general. Universally, however, in later times and technically the *nakṣatras* are the lunar mansions, or stations, through which the moon passes, as the sun through the twelve signs of the zodiac. Originally these seem to have been 27 in number, but in the later literature and in astrological calculations more usually 28. Mythologically they are the wives of the moon and daughters of Dakśa, one of the Ādityas. Like the planets, the *nakṣatras* are important and influential deities, whose countenance is sought before undertaking a journey or making arrangements for marriage or other domestic rites. Every Hindu boy's horoscope contains a reference to the *nakṣatra* under which he is born, and he bears a secret name other than that which is given him at the special name-giving ceremony (*nāmadheya*), which is written in the horoscope and is stated to contain always one letter at least from the name of the *nakṣatra* through which the moon was passing at the hour of his birth.

SUN, MOON, AND STARS (Iranian).—**Astronomy** received much attention in ancient Persia, as is obviously implied by the current tradition that the Magi, the sacerdotal class of the Medes and Persians, were highly skilled in divination, an art which depended largely upon a knowledge of the heavenly bodies, astrology and astronomy being sister sciences in antiquity. The part which the veneration of the sun, moon, and stars played in the national religion of early Iran is well known (see art. ZOROASTRIANISM), and some of the Greeks regarded Zoroaster as much in the light of a professed astrologer and star-worshipper as in that of a wise man and prophet (cf. Diogenes Laertius, *Procem.* i. 6, ἀστροθύτην; Scholiast on the Platonic *Alcibiades*, i. 122; *Clementine Homilies*, ix. 3–6, *Recognitiones*, iv. 27–29; Suidas, *Lexicon*, *s.v.* ἀστρονομία, Ζωροάστρης—all collected in Jackson, *Zoroaster, the Prophet of Ancient Iran*, New York, 1899, pp. 226–273). The Avesta and the Pahlavi books, especially the *Bundahišn* and *Dīnā-i Maīnōg-i Khraṭ*, contain frequent allusions of an astronomical nature; and Persian literature, after the Muhammadan conquest of Iran in the 7th cent., contains similar references. These three sets of sources furnish our chief supply of information, supplemented by comparisons drawn from Babylonia and Assyria, as well as by other material.

1. Conception of the universe.—The ancient Iranians naturally based their astronomical system upon a geocentric conception of the universe. It is probable that in the earliest times the shape of the earth was regarded as round and flat, although it is not altogether clear whether the Avestan word *skarəna*, 'round' (cognate with the Greek σφαῖρα), signified merely circular, or whether it actually meant spherical (*Yašt*, v. 38, x. 95, xvii. 19). It is almost certain, however, that in later times the globular form of the earth was recognized by the Persian astronomers, possibly influenced by Ptolemy, who was a great authority among the Arab-Persian scientists. The spherical shape may be inferred from two Pahlavi passages which apparently contain the idea of the cosmic egg—a wide-spread notion in antiquity. The first of these passages occurs in the *Dīnā-i Maīnōg-i Khraṭ*, xliv. 1–11 (tr. West in *SBE* xxiv. 85): 'The sky is arranged above the earth, like an egg, by the handiwork of the creator Aūharmazd; and the semblance of the earth, in the midst of the sky, is just like as it were the yolk amid the egg.' The second Pahlavi passage is found in the *Dīnkarṭ*, ii. 74. 2 (ed. Peshotan Sanjana, Bombay, 1876, ii. 72): 'The world and the other creatures are placed together in the midst of the sky, like the bird in the midst of the egg; the sky surrounds all, as the egg does the bird' (tr. Casartelli, *Mazdayasnian Philosophy*, Bombay, 1889, p. 107). In the arrangement of the universe the earth was regarded as encompassed by the atmosphere (Av. *vayu*, Phl. *vāi*; or Av. *θwāša*, Phl. *spihr*), above which was the sky or firmament (Av. O.P. *asman*, Phl. *Asmān*, lit. 'stone'), beyond which again rose the empyrean realm (Av. *anaγra raočā*, lit. 'endless lights'), the abode of Ormazd and his angels. Through a misapprehension of the true facts, moreover, the sun and moon were located beyond the sphere of the stars (cf. Phl. *Arṭā-Vīrāf*, vii. 1–x. 13; *Bundahišn*, iv. 4; *Zāṭ-Sparam*, vii. 6; *Šāyast lā-Šāyast*, xii. 5; *Gr. Iran. Bund.*, tr. Darmesteter, *Le Zend-Avesta*, ii. 310; *Dāṭistān*, ii. 1, xxxiv. 2; Av. *Vendidād*, vii. 52; and consult Jackson, 'Die iranische Religion,' § 66, in Geiger and Kuhn, *Grundriss der iranischen Philologie*, ii. 671–672).

2. Sun and moon.—In the Zoroastrian ritual, as preserved in the Avesta, both the sun (*hvar*) and the moon (*māh*) receive high veneration individually, and each has a special hymn of praise devoted to its glorification (*Yašt*, vi. and vii.); besides, minor litanies and prayers are consecrated to their particular service (*Sīrōzah*, i. 11, ii. 11; *Yašt*, vi. 1–7, vii. 1–7; *Nyāiš*, i. 1–10, iii. 1–11). A similar degree of reverence was accorded them during Parthian and Sasanian times, as is shown by the Pahlavi texts themselves and by allusions in the Greek and Latin classics (*e.g.*, Phl. *Šāyast lā-Šāyast*, vii. 1–3; *Dīnkarṭ*, i. 51. 6, the former translated by West in *SBE* v. 297–298, and the latter by Peshotan Sanjana, Bombay, 1875, i. 47, and tr. p. 48: cf. also such classical writers as Strabo, xv. 3. 13, p. 732; Ammianus Marcellinus, *Hist.* xxiii. 6, xvii. 5; Dio Chrysostomus, *Orat. Borysthenitica*, xxxvi.; and Nicolaus Damascenus, frag. 66, p. 401, ed. Müller). The supremacy of the sun among the heavenly bodies is naturally emphasized in the Avesta (*e.g.*, *Yašt*, vi.), and its various positions in the heavens are described in *Bundahišn*, v. 1–7, and *Šāyast lā-Šāyast*, xxi. 1–7. In the latter passage there are to be found special observations of the midday and afternoon shadows with respect to the sun's altitude in the various zodiacal constellations. Solar observations were important in determining the various times of day for performing the sacrifice.

The moon, like the sun, is invoked because of its beneficent influence (*Yašt*, vii. 1–7), and there are several specific allusions to its periodic phases (*e.g.*, *Yasna*, xliv. 3; *Yašt*, vii. 2–4; *Fragment*, viii. 1; *Dāṭistān-i Dīnīk*, lxviii. 1–6, lxxi. 2, tr. West, *SBE* xviii. 210–211, 215). The connexion between the moon and the tides was fully recognized in Sasanian times, and a crude attempt was made to explain it (see *Bundahišn*, xiii. 13–14; *Zāṭ-Sparam*, vi. 14–17). Eclipses, both of the sun and of the moon, were regularly taken into account 'in the calculations of the astronomers,' at least under the Sasanians, as is shown by *Dāṭistān-i*

Dīnīk, lxix. 1–7, and the cause of these obscurations was thought to be the intervention of two bodies that revolve below the two greater lights (*Dāt.* lxix. 1–7; *Šikand Gūmānīg Vijār*, iv. 46, tr. West, *SBE* xviii. 212–213, xxiv. 132).

3. Stars.—There is an abundance of star-lore throughout the entire literature, and particular stars, or groups of stars, are alluded to as guarding the quarters of the heavens into which the Zoroastrians divided the firmament. The chief star in the Avesta, as elsewhere, is called Tishtrya (Av. *tištrya*, Phl. *tištr*), and it is usually identified with Sirius. Tishtrya is regent of the eastern division of the sky, an opponent of the meteors, and the bringer of rain by overcoming Apaosha, the demon of drought (*Yašt*, viii. 1 ff.; *Bundahišn*, ii. 7, v. 1, vii. 1, ix. 2). The fixed star Satavaēsa (Av. *satavaēsa*, Phl. *sat-vēs*, 'having a hundred servitors'), which is possibly to be identified with Fomalhaut, is an ally of Tishtrya, and lord of the southern heavens (*Yašt*, viii. 9, 32, 43, 44; *Bundahišn*, ii. 7, v. 1, xiii. 12; *Šāyast lā-Šāyast*, xiv. 5, vi. 16). The guardianship of the west is entrusted to Vanant (Av. *vanant*, Phl. *vanand*, 'victorious'; cf. *Yašt*, xxi. 1, viii. 12, xii. 16; *Nyāiš*, i. 8; *Bundahišn*, ii. 7, v. 1; *Mainōg-i Khrat*, xlix. 12; *Šikand Gūmānīg Vijār*, iv. 28–38), while the keeping of the north is consigned to the constellation of Ursa Major, called Haptō-iringa (Av. *haptō-iringa*, Phl. *haptō-iring*, 'with seven signs'; cf. *Yašt*, viii. 12, xii. 28, xiii. 60; *Bundahišn*, ii. 7, v. 1, xiii. 12; *Mainōg-i Khrat*, xlix. 12; *Šikand Gūmānīg Vijār*, iv. 28–38). The Pleiades (Av. *paoiryaēinī*) are mentioned in the Avesta (*Yašt*, viii. 12), and there are certain other allusions that may contain the names of special stars, though their interpretation is open to question (see Kuka, 'Stars mentioned in the Avesta' in *Zartoshti*, ii. 7–22, Bombay, 1904). In giving an account of creation, the Pahlavi book *Bundahišn* (ii. 5) sets the number of stars at 6480 (or 6,480,000, according to another reading). This figure is not uninteresting when taken in connexion with the fact that astronomers generally allow that between 5000 and 8000 fixed stars are visible to the naked eye. Regarding the identification of certain of the major stars, though some are positively sure, reference may be made to a monograph by Muncherji P. Kharegert, 'Some Heavenly Bodies mentioned in Old Iranian Writings,' in the *Sir Jamsetjee Jejeebhoy Madressa Jubilee Volume*, Bombay, 1914, pp. 116–158; see also Moulton, *Early Zoroastrianism*, London, 1913, pp. 23–27, 210–213, 279–281.

4. Planets, meteors, and comets.—In contrast to the fixed stars and regular constellations, the planets, meteors, and comets were held by Zoroastrians to be disturbers of the established order of the universe, and consequently to be of Ahrimanian origin and evil nature—a point of view directly opposed to that of Babylonia, where the planets were looked upon as distinctly beneficent in character (cf. Jastrow, *Religion of Babylonia and Assyria*, Boston, 1898, p. 373). To the planets Mercury, Mars, Jupiter, Venus, and Saturn (the only five then known, but making seven with the sun and the moon, by the side of which they were usually mentioned) there were given, respectively, in Pahlavi the euphemistic names *Tīr*, *Vahrām*, *Aūharmazd*, *Anāhid*, and *Kēvān*, derived from divine names, including the name of the god Ahura Mazda himself, because these beneficent powers curb and restrain the maleficent influence exercised by the planets (*Bundahišn*, v. 1–2; *Šikand Gūmānīg Vijār*, iv. 1–5; *Zāt-Sparam*, ii. 10, iv. 7–10, vi. 1–2; and consult the list in al-Bīrūnī, *Chronology*, tr. Sachau, London, 1879, p. 172). The Persian treatise *Ulamā-i Islām* (tr. Vullers, *Fragmente über die Religion des Zoroaster*, Bonn, 1831, p. 52) states that they originally bore the names of demons, but were afterwards given designations of good omen. At the same time it is not impossible that we have in their nomenclature a translation of the Babylonian names of the planets, *Nabu*, *Nergal*, *Marduk*, *Ištar*, *Ninib*, as may be surmised from the equations, Marduk (lord of the gods) = Aūharmazd = Jupiter; Nergal (god of war) = Vahrām = Mars; and Ištar = Anāhid = Venus; on the confusion between Tishtrya ('Sirius') and Tir ('Mercury') compare the note by Gray, *ERE* i. 798[b]; and, for the Babylonian names of the planets, consult Jensen, *Kosmologie der Babylonier*, Strassburg, 1890, pp. 134–139; Jastrow, *Religion of Babylonia and Assyria*, pp. 370, 454–466. This parallel, in any case, is of interest because the Sanskrit names given by the Hindus to the planets show no likeness to the Babylonian (cf. Weber, *Vorlesungen über indische Literaturgeschichte*[2], Berlin, 1876, p. 267 f.). Shooting stars are alluded to in the Avesta (*Yašt*, viii. 8) under the name of *kərəmā stārō*, a designation meaning, perhaps, 'worm stars'; and there are several passages, in both Avesta and Pahlavi literature, which allude presumably to comets (*Yasna*, xvi. 8; *Bundahišn*, v. 2, xxviii. 44, xxx. 17; *Dātistān-i Dīnīk*, xxxvii. 55, lxix. 2).[1]

5. Signs of the zodiac.—The names of the twelve signs of the zodiac, at least in Sasanian times, correspond in concept with those familiar to us through the Greek and Latin designations, and are parallel likewise with the Babylonian, from which, like the Indo-Germanic zodiac in general, they are believed to be derived, and of which their names are translations—a phenomenon precisely paralleled in India and in other Asiatic countries (see Ginzel, *Handbuch der Chronologie*, i., Leipzig, 1906, pp. 78–88). Thus in Pahlavi we find *Varak* ('Ram,' Aries), *Tōrā* ('Bull,' Taurus), *Dō-patkar* ('Two-figures,' Gemini), *Kalakang* ('Crab,' Cancer), *Šēr* ('Lion,' Leo), *Khušak* ('Maiden,' Virgo), *Tarāzuk* ('Balance,' Libra), *Gazdūm* ('Scorpion,' Scorpio), *Nēmasp* ('Half horse,' Centaur or Sagittarius), *Vahīk* ('Goat,' Capricorn), *Dūl* ('Waterpot,' Aquarius), *Mahīk* ('Fish,' Pisces). The names of the twenty-eight lunar mansions, as recognized in 'the subdivisions of the astronomers' (Phl. *xūrtak-i hāmārīkān*), are given in the *Bundahišn* (ii. 3); but the reading of the various designations is by no means sure, and the individual identification of the names remains, therefore, uncertain, even when compared with those in the Soghdian and Khorasmian list, given about A.D. 1000 by al-Bīrūnī (*Chronology*, tr. Sachau, p. 227 f.).[2] Possibly some further light may be gained from a study of the terminology used for these asterisms by the Hindus, Chinese, and Arabs, if not by the Babylonians (see Ginzel, *op. cit.* pp. 70–76). Such an attempt has already been made from the Sanskrit side, in comparison with Avestan and Pahlavi, by a Parsi scholar named Anklesaria, in an article entitled 'Asterisms in Iranian Literature' in *Cama Memorial Volume*, Bombay, 1900, pp. 216–227.

6. Prediction of events.—Like the reference in the preceding paragraph to the minute subdivisions used by the astronomers (*Bund.* ii. 3), there are kindred allusions in Sasanian literature to 'the calculations of the astronomers' or to 'the com-

[1] The Soghdian names of the planets given by Manichæan fragments discovered at Turfan, in Chinese Turkestan, correspond in general to the forms given above (see F. W. K. Müller, 'Die "persischen" Kalendarausdrücke in chinesischen Tripiṭaka,' *SBAW*, 1907, pp. 458–465).

[2] The zodiacal names given by the Turfan fragments (Müller, *loc. cit.*) are identical with those of Eastern Asia, as found in China, Siam, and Cambodia, as well as in Tibet and in Old Turkish inscriptions (Ginzel, pp. 85–87, 404, 411, 452, 501), thus differing entirely from the Babylonian nomenclature.

putations made by astrologers' with regard to observing favourable or unfavourable conjunctions of the stars (*e.g.*, *Dāṭistān-i Dīnīk*, lxix. 3; *Šikand Gūmānīg Vijār*, iv. 28; *Epistles of Mānuščihar*, II. ii. 9–11; see West, *SBE* v. 11, xxiv. 130, xviii. 212, 333–335, xxxvii. p. xlvii). Ardavān, the last of the Parthians and predecessor of Ardashīr Pāpakān, who founded the Sasanian dynasty in the 3rd cent. A.D., is represented as consulting on grave matters with his 'wise men and constellation-knowers' (*dānakān va axtar-mārān*, in the Pahlavi text *Kārnāmē-i Artakhshīr-i Pāpakān*, ii. 4–5, iii. 5–6, ed. Darab Peshotan Sanjana, Bombay, 1896, pp. 10–11, 15–16), and their knowledge of the position of the stars at the moment enabled them to predict to him future events. In a Pahlavi work dated A.D. 881 and entitled *Epistles of Mānuščihar*, II. ii. 9–11 (re-translated by West, *SBE* xxxvii., Introd. p. xlvii), there is a specific allusion to a set of astronomical 'tables' (Phl. *zīk*, cf. Arab. *zīj*, and the Byzantine Gr. ζῆζι of Theodorus Meliteniotes, ed. Usener, *Ad historiam Astronomiæ Symbola*, Bonn, 1876, p. 14), which were constructed by 'the great Shatro-ayār.' See, more fully, art. SUN, MOON, AND STARS (Muhammadan), p. 95[b] below. The passage cited mentions the tables alongside of those of Ptolemy and of the Hindus.

7. Astronomical works.—Some of the works from which citations have been drawn above, like the one last quoted, actually belong to the early Muhammadan period of Persia, even though written in Pahlavi. Astronomy, influenced by Arab science, continued to flourish in Iran under Muslim rule. The notable scientific achievements of the great savant and chronologist, al-Bīrūnī of Khiva (973–1048), are sufficient to prove that fact, and it is certain that computations of the positions of the heavenly bodies must have played an important part in the reform of the calendar and establishment of the new Jalalian era, in 1079, by the Seljūk sultan, Jalāl-al-dīn Malikshāh, under the direction of a commission of scholars headed by the well-known astronomer poet, Omar Khayyam. Omar, in fact, had been summoned to Merv by the sultan, four years previously, to make observations in the royal observatory, and there he constructed the *Zīj-i Malikšāhī*, 'Astronomical Tables of Malikshāh,' which were employed in the calendar reform. The names of two of his colleagues engaged upon the reform were Abu'l Muẓaffar al-Isfizārī and Maimūn ibn Najīb al-Wāsiṭī (see Browne, *Literary History of Persia*, London, 1906, ii. 181, n. 2). A section of a large work composed in 1082–1083 by Kai-Kā'ūs and entitled *Qābūs-Nāmah* (ch. 34) was devoted to 'astrology and mathematics' (ed. Teheran, 1285 A.H.; tr. A. Querry, Paris, 1887; cf. Browne, *Lit. Hist. Pers.* ii. 277). The Persian poet Anvarī, of the 12th cent., was a great astrologer, and a conjunction of the planets in the sign of Libra, calculated to take place on September 16, 1186 (or in October of the preceding year, according to other accounts), led him to predict dire calamities for that day; but happily they did not occur (see Browne, *Lit. Hist. Pers.* ii. 368; Horn in *GIrP* ii. 262–263). In the 13th cent. the Mongol ruler Hulāgū Khān, grandson of Chingīz Khān, established a celebrated observatory at Marāghah, in Azarbaijan, Western Persia, the building of which was begun in 1259, and traces of its ruins are still to be seen (cf. Wilson, *Persian Life and Customs*, New York, 1895, p. 77). Hulāgū's astronomer-royal was the learned Naṣīr-al-Dīn of Ṭūs (1201–1274), whose *Zīj-i Īlkhānī*, or almanac and astronomical tables, was a notable contribution to science (see Browne, *Lit. Hist. Pers.* ii. 484–486). The names of several other mediæval Persian astronomers, with a mention of their tables, are found in the Byzantine treatise of Theodorus Meliteniotes, referred to above (ed. Usener, pp. 13–14). Best known among the astronomical tables, however, are those of Ulugh Begh, grandson of Timur and founder of the observatory at Samarkand, in which city he died in 1449. These tables, written in Arabic, were translated into Persian and were made accessible in Europe through a Latin version by Greaves (Gravius, London, 1652), and again by Hyde in Persian and Latin (Oxford, 1665), and more recently by Baily (London, 1843) in *Memoirs of the Royal Astronomical Society*, xiii. 79–125. With reference to the present status of astronomical studies in Persia itself, one of the largest meteorites in the world is preserved as a curiosity in the Shah's palace at Teheran to-day; but there is no astronomer-royal to know its true value, and Persia must still wait a renaissance before independent work in studying the heavens is done by those of native birth.

8. Influence of the heavenly bodies.—The astrological aspects of Persia's early studies of star-lore have already been indicated above. In fact, there is little reason to doubt that 'judicial astrology,' or the attempt to determine scientifically the presumed influence of the heavenly bodies upon the destiny of human events, was often regarded more highly than natural astrology, or astronomy in our sense, which confines its investigations to determining the motions and positions of the stars, sun, and moon, in order to gain more strictly scientific results, as we regard them.

In some of the paragraphs given above there have been allusions to the beneficent part played by the sun and the moon in the development of the world and in advancing the welfare of mankind (*e.g.*, *Yašt*, vi. 1–5, vi. 5; *Bundahišn*, vii. 2–4, and elsewhere), while the stars also entered into the sphere of human activity by exercising a kindly sway over the earth. Thus the great rain star Tishtrya, aided by Satavaēsa in the Avesta (*Yašt*, viii. 1–62; *Sīrōzah*, i. 13, ii. 13), combats the demon of drought, when invoked by men, and confers blessings upon his faithful worshippers. The victorious star Vanant (*Yašt*, xx. 1) repulses the influence of evil; and Haptō-iringa (Ursa Major) is effective even in tempering the torment of the souls in hell, a region located in the North (*Maīnōg-i Khraṭ*, xlix. 15–21; *Šikand Gūmānīg Vijār*, iv. 31–33). The three fixed stars or constellations just named are regarded in the Pahlavi book *Šāyast lā-Šāyast* (xiv. 5–6), which was written about the 7th cent., but contains older material, as exercising an influence upon the efficiency of the sacrifice during the time of their ascendancy. In another chapter of the same work (*Šāyast lā-Šāyast*, xxi. 1–7) a specifically fortunate character is ascribed to the shadow of the noonday and afternoon sun when occupying certain positions in the zodiacal signs; and in *Dāṭistān-i Dīnīk*, vi. 9, the stars are synonymous with destiny. The malign influence ascribed to the planets has been sufficiently indicated above, and need not be referred to again in this section.

Sufficient reference has likewise been made to the part played by astrology, astrologers, and horoscopes both in Sasanian and in Muhammadan-Persian times. We need only recall the allusion to the last of the Parthian kings, Ardavān, and his astrologers (*Kārnāmē*, ii. 4–5, iii. 5–6), and we have the authority of the great Khorasmian scientist al-Bīrūnī for the fact that the Persian astrologers, like others, held that the zodiacal sign of Cancer was 'the horoscope of the world' (al-Bīrūnī, *Chronology*, tr. Sachau, p. 55). A good illustration, in the 17th cent., of ephemerid tables that were used also for horoscopic purposes may be found in a work translated from the Arabic, Persian, and Turkish, with a Latin commentary,

by Beck, in his *Ephemerides Persarum per totum annum*, Augsburg, 1696 (especially chs. iii.–iv., vi.). Even to-day the astrologer's art in casting a horoscope holds an important place in the life of the ignorant and superstitious folk of Persia, and it still survives, though it is gradually disappearing, among the Zoroastrian Parsis of India (cf. Karaka, *History of the Parsis*, London, 1884, i. 160–162).

LITERATURE.—For a translation of the Avesta and the Pahlavi books consult the versions by Darmesteter and West in *SBE*, vols. iv., xxiii. ; and v., xviii., xxiv., xxxvii., and by Mills, *ib.* xxxi.; likewise the French translation by Darmesteter, *Le Zend-Avesta*, 3 vols., Paris, 1892–1893. The more important single works on the subject have been given in the course of the article. A. V. WILLIAMS JACKSON.

SUN, MOON, AND STARS (Japanese).—In the ancient mythology of Japan the sun-goddess plays the most important rôle, while the moon-god, her brother, occupies an insignificant place, and almost nothing is told about stars. The commonly accepted story is that the sun-goddess (Amaterasu, 'the heaven-shining deity') and the moon-god (Tsuki-yomi, 'the ruler of the moonlight night') were born, together with the storm-god (Susa-no-wo, 'the swift-impetuous'), of the couple who were the progenitors of the Japanese archipelago.[1] In this story the creation of these deities is conceived evidently as a generative act, whereas another version makes the emergence of the two deities from the 'white copper' mirrors the work of the male progenitor alone. Perhaps a more interesting version of the story is that the sun and the moon were produced out of the eyes of the progenitor, when he was washing in order to purify himself from the stains with which he had been contaminated on his visit to the infernal world after the death of his consort.[2] Though there are these different versions, the common trait and predominant factor in the story is that the sun-goddess is considered to be the supreme ruler of heaven and earth, and also the progenitrix of the ruling family, who claim to have handed down from the goddess herself the three insignia of the throne (see below). Now the relation between the sun-goddess and the moon-god is based on the natural phenomenon that the two are visible alternately by day and by night. The story is as follows :

> The sun-goddess once commissioned her brother, the moon, to go down from their heavenly abode to earth to see Ukemochi, the female genius of food. When the latter entertained the moon with the food-stuffs taken out of her body, the moon became flushed with anger and slew the goddess of food. The sun-goddess was so displeased with her brother's wantonness that she said to him : 'Thou art a wicked deity. I must not see thee face to face.' Hence the sister and brother appear alternately in heaven.[3]

The intention of the story is evident, but at the same time it shows a characteristic of the sun-goddess as the matron of agriculture, which played a great part in the myths and worship of the goddess.[4] Thus, in contrast to the prominent rôle played by the sun-goddess, the moon plays a very inferior part, and a much smaller part is played by the stars. A star-god is mentioned in the ancient myth, but his rôle is quite ambiguous, while a festival in honour of certain stars (the stellar constellations called the Herdsman and the Weave-maid) was derived from China. All other stories and worship of stars are much later and were introduced chiefly through Buddhist agency, though some of them may have been derived from other sources—Hindu, Persian, or Chinese. The most prominent star-worship is that of the Pole star, together with Ursus Major. These stars, conceived as one deity, are worshipped by the Buddhists as the protector of the country as well as of individual fortune, while the Shintōists identify them with the Taoist 'palace of iridescent subtlety' (Shi-bi-kyū in Sino-Japanese), where the highest deity of Shintō, the 'eternal-ruling' (Minaka-nushi), is believed to reside. But this Shintō worship is of late origin ; it was specially emphasized by a Shintō theorizer in the early part of the 19th century.

When Buddhism was introduced into Japan (6th cent.) and questions came up as to the relationship between the indigenous deities and the Buddhist pantheon, the Buddhist teachers tried to discover analogies between them and to explain that the Buddhist deities were the original noumena and the native ones their lateral manifestations. The most striking analogy was found between the sun-goddess and the aspect of Buddha's personality conceived in the sun-myth. The difference in gender concerned the syncretist but little, partly because the Japanese language had no genders and partly because the noumenon and the manifestation may take any sex. The result was an identification of the Japanese sun-goddess with Buddha Vairochana ('the illuminator'), and this conception exercised a wide influence on doctrine and worship during the sway of the syncretic Shintō from the 8th cent. down to the middle of the 19th, when the combination was dissolved by force. Among the theorizers of the syncretism we may cite one, Kanera (1402–81), who explained sun, moon, and stars as corresponding to the three insignia of the throne, *i.e.* the sun to the mirror, the moon to the jewel, and the stars to the sword.[1] This eclectic theory was backed by the popular conception of the 'three illuminating bodies' (*San-kō*) and their worship. People even nowadays regard a simultaneous appearance of the three as an auspicious occasion for worship and as a sign of special blessing to the country—*e.g.*, when on an autumn day the clear sky and the comparatively weak light of the sun cause the new moon and a certain star (Venus) to be visible to the eyes. Naturally, various configurations of the celestial bodies were used for methods of divination and predictions. In these methods Hindu, Persian, and Chinese elements may be detected, and their influence is still a living force among the mass of the people.

LITERATURE.—Besides the works cited in the footnotes, see M. Anesaki, *Japanese Mythology* (=vol. viii. of *The Mythology of All Races*), Boston, 1920. M. ANESAKI.

SUN, MOON, AND STARS (Muhammadan).—I. *ASTROLOGY.*—1. Name.—Among the Muslims the technical name of astrology is *'ilm* (or *ṣinā'at*) *aḥkām an-nujūm*,[2] 'science (or art) of the decrees of the stars,' *'ilm al-aḥkām*, 'science of the decrees.' Sometimes, though rarely, in place of *aḥkām* its synonym *qaḍāyā* is found. Another name is *an-najāmah* (*nijāmah*) or *'ilm an-najāmah*. On the other hand, the names *'ilm* (*ṣinā'at*) *an-nujūm*, 'science (or art) of the stars,' *'ilm at-tanjīm*, mean astronomy as well as astrology, and they also mean both of these sciences taken together. The word *aḥkām* also signifies 'judgments,' 'judicial decisions' ; accordingly the first of the denominations given above was in the Middle Ages translated in the Latin versions of Arabic works by *scientia judiciorum stell-*

[2] See *Koji-ki, or Records of Ancient Japan*, tr. B. H. Chamberlain (*TASJ*, Suppl. to vol. x. [1883]), pp. 42–44. This version is preserved also in *Nihongi*, p. 32, and, for its connexion with the conception of life and death, see art. LIFE AND DEATH (Japanese).

[3] *Nihongi*, p. 32.

[4] Aston, *Shinto*, London, 1905, p. 282 f., where the ritual to the goddess for harvest is cited.

[1] See art. PHILOSOPHY (Japanese), vol. ix. p. 870.

[2] As in the case of the other branches of scientific literature, so for astrology the Musalmān peoples made use of the Arabic language.

arum, and thence came the name of *astrologia judiciaria* or *astronomia judiciorum*, astrology, as opposed to *astrologia* (*astronomia*) *quadrivialis* (or *doctrinalis*), which is astronomy. Thus in the denomination of astrology among the Musalmāns there is a concept somewhat different from that contained in the Greek term [τέχνη] ἀποτελεσματική, 'science of the fulfilment [of astrological prognostications].' The astrologer is usually called by the same name as the astronomer, viz. *munajjim* (much more rarely *najjām*); sometimes, however, he is called by the special word *aḥkāmī* (plur. *aḥkāmiyyūn*, *aṣḥāb ṣinā'at al-aḥkām*). It was only in the 19th cent. that the distinction between *munajjim*, 'astrologer,' and *falakī*, 'astronomer,' was introduced into Arabic (at least in Egypt and in Syria).

2. Divisions.—The Muhammadans usually arrange the science of astrology under five principal heads:

(*a*) The fundamental principles of astrology, viz. the different divisions of the ecliptic, the properties of the various celestial places and of individual planets, the methods of determining the ascendant and the 12 celestial houses (*buyūt*, 'domus'), the planetary conjunctions, etc.

(*b*) Prognostics of a universal character (*al-aḥkām 'alā umūr al-'ālam*), viz. those which refer to the vicissitudes of kingdoms, dynasties, religions, and cities, to wars, epidemics, famines, winds, rains, the prices of goods, etc. This part of astrology, which Ptolemy calls ἀποτελεσματικὴ καθολική, 'universal apotelesmatics,' is usually called by the Arabs *taḥāwīl sinī al-'ālam*, 'revolutiones annorum mundi,' since a great part of these prognostics is deduced from the planet which has the dignity of 'significator' (ἀφέτης, *dalīl*, *haylāj*) at the moment when the sun enters Aries, *i.e.* at the beginning of each tropic year. This universal part of astrology is subdivided into three sections: (i.) predictions drawn from the various kinds of planetary conjunctions (*qirānāt*, *iqtirānāt*), (ii.) predictions based on the 'revolutiones annorum mundi,' (iii.) predictions relating to the 'mutationes aëris' (*taghayyur al-hawā'*), *i.e.* to meteorological phenomena, and which are deduced from the lunar stations, or from the heliacal rising of Sirius, etc.

(*c*) Individual prognostications relating to the vicissitudes of individuals, derived from the planet or other celestial place which may happen to be the 'significator' at the moment of birth, and then from the 'significator' at each revolution of successive tropic years. This part of astrology Ptolemy calls γενεθλιαλογική, and the Arabs *al-mawālīd*, 'nativitates.'

(*d*) *Masā'il*, 'interrogationes' (ἐρωτήσεις), or that part of astrology which is concerned with replies to questions, *e.g.*, the circumstances of a distant relative, the author of a theft, the hiding-place of a runaway slave, etc. The 'interrogationes' are always connected by the Muhammadan astrologers with the division of the heavens into 12 'domus.' The astrologers who follow the pure tradition of Ptolemy do not admit the 'interrogationes.'

(*e*) *Iḫtiyārāt*, 'electiones,' *i.e.* the choice of the propitious moment for doing any particular thing. The most common method is that of determining such a moment by seeking in which of the 12 celestial 'domus' the moon is found at that particular moment. This was also very probably the method employed by the Greeks; but along with this some Muhammadan astrologers use another method, of Indian origin (but also attributed to Dorotheus), which consists in deducing the fitting moment for action from the place which the moon then occupies in one of the 28 lunar stations or mansions (*manāzil*). The 'electiones' also are not admitted by the astrologers who follow Ptolemy's teaching.

3. Place among the sciences.—The science of the stars, says Ptolemy at the beginning of his *Tetrabiblos*, or *Quadripartitum*, consists of two parts: the first studies the appearances of the motions of the heavenly bodies either with respect to each other or with respect to the earth; the second seeks to deduce, from the physical qualities of those appearances, the changes which take place in the sublunar world. The first part is a science which stands by itself, and can be studied independently of the second; this, on the contrary, cannot do without the first. This conception that astrology is but the sister of astronomy, a branch, that is to say, of the 'science of the stars,' which in its turn is a part of 'mathematics' (*'ulūm riyāḍiyyah*, *'ulūm ta'līmiyyah*, *ta'ālīm*), is common to all the Musalmān astrologers and astronomers, and is accepted also by some philosophers (al-Fārābī in his *de Scientiis*, and the Iḫwān aṣ-ṣafā', or 'sincere companions' of the 10th cent. in their *Epistles*), by the author of the *Mafātīḥ al-'ulūm*, or 'Encyclopædia of the Sciences' (10th cent.), and by the great historian philosopher Ibn Ḫaldūn (*Proleg.* lib. vi. cap. 13; M. G. de Slane's Fr. tr., Paris, 1862–68, iii. 122 f.).

Astrology, however, is classified in a different way by the majority of the philosophers. Musalmān writers commonly divide all science into two great categories: (*a*) sciences which relate to religious law (*'ulūm shar'iyyah*), that is to say, in addition to theology and canon law, the learning which serves as an introduction to them, namely, grammar, lexicography, rhetoric, poetry, history, etc.; (*b*) intellectual or philosophic sciences (*'ulūm 'aqliyyah* or *ḥikmiyyah*), which the author of the *Mafātīḥ al-'ulūm*, thinking of their origin, calls *'ulūm al-'ajam*, 'foreign sciences.'[1] The intellectual or philosophical sciences in their turn are for the most part divided into the three sections[2] already fixed by the later Greek peripatetics and by the Neo-Platonic expounders of Aristotle (*e.g.*, Ammonius, Simplicius, and Johannes Philoponus), namely: (*a*) metaphysic (*al-ḥikmah al-ilāhiyyah*, θεολογία, τὰ μετὰ τὰ φυσικά); (*b*) natural sciences (*al-ḥikmah aṭ-ṭabī'iyyah*, 'natural philosophy,' φυσική); (*c*) mathematical sciences (*al-ḥikmah ar-riyāḍiyyah*, μαθηματική). These last correspond to the *Quadrivium* of Boethius, namely, arithmetic, geometry, astronomy, and music; on the other hand, the natural sciences are subdivided into eight fundamental parts, named for the most part after the titles of the corresponding Aristotelian works, namely: *Auscultatio physica*, *Generatio et corruptio*, *Cœlum et mundum*, *Meteoræ*, *Mineralia*, *Vegetalia*, *Animalia*, *de Anima*. Avicenna (*Fī aqsām al-'ulūm al-'aqliyyah*, in *Tis'rasā'il*, Constantinople, 1298 A.H. [=A.D. 1881], p. 71 ff.), Muḥammad al-Akfānī as-Šahāwī (*Irshād al-qāṣid*, ed. A. Sprenger, Calcutta, 1849; the author died in 749 A.H. [=A.D. 1348]), Ḥājjī Ḫalīfah (in the introduction to his *Lexicon bibliographicum et encyclopædicum*),[3] and others consider astrology as one of the 7 (or 9) *furū'*, 'secondary branches' of the natural sciences, placing it, that is to say, beside medicine, physiognomy, interpretation of dreams, alchemy, the science of talismans, etc. This same classification of the natural sciences is found in al-Ghazālī († 505 A.H. [=A.D. 1111]), who, in his *Tahāfut al-*

[1] Each of these two great categories afterwards gives place to the distinction between theoretical (*naẓariyyah*) and practical (*'amaliyyah*) science—a distinction which has its origin in Aristotle (E. Zeller, *Die Philosophie der Griechen*[3], Tübingen, 1875–81, II. ii. 177).

[2] Other divisions, indicated in the writings of the Iḫwān aṣ-ṣafā', in the *Mafātīḥ al-'ulūm*, etc., are useless for our present purpose.

[3] Ed. G. Flügel, 8 vols., London, 1835–58.

falāsifah, Cairo, 1319 (1901), p. 63 f., refers to it as common amongst the Musalmān peripatetics, and approves of it.

Averroës, in the *Tahāfut al-tahāfut*, Cairo, 1319 (1901), p. 121, admits, as corresponding to Aristotelian teaching, the eight fundamental parts of the natural sciences; but he denies that the so-called derived branches are sciences. Medicine, he says, is an art (*ṣinā'ah*) and not a science; it has a practical and not a theoretical character; accordingly astrology is included in the same category with divination from the flight of birds and from the movement of quadrupeds (*zajar*), with divination in the form of vaticinations (*kahānah*), with physiognomy and with the interpretation of dreams, all being arts which have as their aim the prediction of the future, but which 'are not sciences either theoretically or practically, however it may be supposed that one may sometimes derive some practical advantage from them.'

A curious classification is found at the beginning of the unedited book *de Interrogationibus* (*Fī'l-masā'il*) of the astrologer Ya'qūb al-Qaṣrānī, who lived in the 3rd cent. A.H. (9th A.D.). According to the catalogue of the Arabic MSS of Berlin (W. Ahlwardt, *Verzeichniss der arab. Handschriften*, Berlin, 1887–99, v. 275, no. 5877), he maintains three degrees (*marātib*) of science: theology, medicine, science of the stars; the last, being based not on observation, but on deduction from analogy, occupies a place between the other two.

4. Sources.[1]—(*a*) *Greek.*—These are represented by the classic (if we may call it so) astrology of the *Tetrabiblos* or *Quadripartitum* of Ptolemy; by the writings of Dorotheus Sidonius (1st cent. A.D.), which go back to the Græco-Egyptian tradition; by the great eclectic compilation of Vettius Valens (2nd cent. A.D.);[2] by the book on the 'decani,' the 'interrogationes,' and the nativities of Antiochus of Athens (2nd or 3rd cent. A.D.), which appears especially to follow the Babylonian tradition; by the Καρπός, or *Centiloquium*,[3] falsely attributed to Ptolemy; by some works ascribed to the mythical Hermes;[4] and by an author whose name (Rīmos?, Zīmos?) is cited by Arabic writers in a form so corrupt as to be unrecognizable. Of another Greek writer, Teucer or Teucrus of Babylon, the Arabs had knowledge through Iranian sources.

(*b*) *Indian.*—The Musalmān writers mention seven or eight Indian astrologers, whose names, however, it has not as yet been possible to identify with the corresponding Sanskrit. The most important is K.n.k.h or K.t.k.h, who, according to some Arabic writers, appears to have come to Baghdād to the court of the khalīf al-Manṣūr, bringing thither astronomical books of India, and, according to others, making known Indian arithmetic. The Arabs attribute to him writings on the *numūdār* (that is, on the method of ascertaining a factitious ascendant of the nativity), on the nativities, and on the conjunctions of the planets; it is therefore plain that he had also treated of the part of Indian astrology called in Sanskrit *horā* or *jātaka*, which arose through Greek influence. This confirms a conjecture of F. Boll (*Sphaera*, Leipzig, 1903, p. 414 f.), who, from the citations contained in the *Introductorium* of Abū Ma'shar (or Albumasar), infers that K.n.k.h had before him materials of distant Greek origin for his representation of the figures arising in the heavens together with the 'decani.' But in general, Musulmān astrologers cite simply 'the Indians' (*al-Hind*), without particular names of authors. We must further add that the influence of Indian astrology made itself felt sometimes through Iranian writings and oral teaching, as is apparent from some Indian words which have passed into Arabic terminology in an Iranian form—*e.g.*, *darījān* (Ind. *drekkāṇa*).

(*c*) *Iranian.*—These are in the Pahlavī language or Middle Age Persian. The writings of Teucrus of Babylon (second half of the 1st cent. A.D.) on the figures arising in the heavens together with the 'decani' reached the Arabs through a Persian version, where the name of the author, on account of the ambiguity of the Pahlavī writing, was afterwards spelt by the Persians and Arabs Tīnkalūs (also Tankalūsh or Tankalūshā); so that in the *Introductorium* of Abū Ma'shar his teachings were given as 'teachings of the Persians' (*madhhab al-Furs*) and contain also some Persian names of constellations (cf. Boll, p. 415 f.). Another source was Buzurjmihr's commentary on the astrological Ἀνθολογίαι of Vettius Valens; the Pahlavī translation of the Greek title was *vizīdhak*, 'selected,' which became in Arabic *al-bizīdhaj* and was afterwards variously and strangely corrupted by Arabic writers.[1] The Musalmāns also cited as a source of astrological teachings the mythical Zoroaster (Zarādusht in Arabic writings, Zardusht in modern Persian writings), whose name indeed was already frequently found in Greek astrology of the 4th and following centuries. A fourth source is the book on 'nativities' of [al-]Andarzghar, son of Zādānfarrūḫ; but we lack information about this personage, whose name is corrupted into Alendezgod in the Latin version of Alcabitius (al-Qabīṣī), and into Andruçagar in the Latin version of the book of the Jew Ibn 'Ezrā on nativities (which always draws on Arabic sources). Those astrological writings which are ascribed by the Arabs to Jāmāsp the Wise (the trusted counsellor of the mythic king Gushtāsp) seem to be late Muhammadan falsifications.

We do not know exactly when all these works hitherto mentioned were first translated into Arabic, but it is certain that the great majority of them were known in the second half of the 8th cent. A.D., that is, when Musalmān culture began. If the indication placed at the end of the unedited *'Arḍ miftāḥ an-nujūm* of Hermes (MS in Biblioteca Ambrosiana in Milan) is true, this book would seem to have been translated in the month Dhū 'l-qa'dah, 125 A.H., namely, in September 743 A.D., while the Umayyad khalīfs were still reigning. The first version of the *Tetrabiblos* is due to Abū Yaḥyā al-Baṭrīq, a translator of the time of al-Manṣūr, the second 'Abbāsid khalīf (136–158 A.H. [A.D. 754–775]); Dorotheus and Antiochus are already mentioned in the writings of Mā shā' Allāh (Messahala) in the second half of the 8th cent.; all the other Greek authors mentioned above are amply cited by the astrologers of the 9th century. As has already been said, the writings of the Indian K.n.k.h seem to have been known at Baghdād in the time of the khalīf al-Manṣūr; and about the middle of the 9th cent. we have already several small astrological works of al-Kindī (Alchindus) formed expressly on Indian models. It is almost certain that the Persian books were translated by members of the family

[1] For details see the present writer's Arabic lessons on the origins of astronomy among the Arabs (*'Ilm al-falak, ta'rīḫuhu fī 'l-qurūn al-wusṭā*, Rome, 1911–12), pp. 189–215 (Iranian sources), 216–220 (Greek sources), etc.

[2] Muhammadan astrologers were also acquainted with the *Anthologiæ* of Vettius Valens through an Arabic translation of a Pahlavī version; cf. below, under (*c*).

[3] The Arabic tr. is rather a paraphrase, which attempts to interpret the theories obscurely indicated in the Greek text.

[4] Some of the works attributed to Hermes seem to be Musalmān falsifications—*e.g.*, the book *de Revolutionibus nativitatum*, which has reached us in a Latin translation.

[1] In the Latin version of Albohazen Haly filii Abenragel, *De iudiciis astrorum*, Basel, 1571, the name of the book is *Yndidech* (p. 149, col. b), *Enzirech* (p. 176, col. a), *Endenadeyg Persarum* (p. 347b), *Endemadeyg Persarum* (348b), *Andilarehprosu* (404b).

Nawbaḫt, known by their translations from Pahlavī into Arabic (cf. *Kitāb al-Fihrist*, pp. 244, 274), whose head was astrologer at the court of al-Manṣūr; and in any case the antiquity of Iranian influence in astrology is attested by the fact that in the works of Mā shā' Allāh, according to the Latin translation of John of Seville, technical terms of Iranian origin are freely used: *e.g.*, *alhyleg* (*alhaylāj*), *alcochoden* (*al-kadḫudāh*), *alimbutar* (*al-jānbaḫtān*).

Side by side with the written sources there was, without doubt, the oral tradition of the peoples converted to Islām.[1] Among the Syrians Christianity had almost suffocated astrology, although Bardesanes (154–222) had reconciled Christian dogma with an attenuated form of predestination by means of the stars; all the same we know that at Ḥarrān, the ancient Carrhæ, special astrological traditions flourished along with other pagan sciences. It is further probable that Theophilus, son of Thomas, a Christian of Edessa who was astrologer of the khalīf al-Mahdī (A.D. 775–785), and who has been cited by several Musalmān astrologers as an authority on the subject of 'electiones,' again took up with Syrian oral tradition. In the same manner it is natural that there were absorbed into Musalmān culture the astrological beliefs and practices of the Aramaic centres (tending to paganism) of Mesopotamia and Babylonia, of the Egyptians, etc. Finally, we must not forget the Judaic element which had a notable part in the first ages of Musalmān astrology; in fact, among the principal writers on astrological matters in Arabic in the 2nd and 3rd centuries of the Hijra are the Jews Mā shā' Allāh, Sahl ibn Bishr, Rabban aṭ-Ṭabarī, and Sanad ibn 'Alī.

5. Special character.—The civilized peoples over whom the Arabic domination of the 7th, 8th, and 9th centuries extended, viz. Greeks, Copts, Syrians, Persians, and Indians, had already imagined all the possible fundamental combinations concerning the influence of the stars over mundane events; consequently it was impossible for the Musalmān astrologer to find out anything substantially new. On the other hand, the principal justification of astrology consisted precisely in presenting itself as the jealous preserver of that which an age-long experience had taught the wise of preceding generations. The office of the Musalmān astrologers consequently was reduced to a choosing of what seemed suitable among the many principles and methods of their predecessors, and at times to a harmonizing of elements of very diverse origin, amplifying and completing particular points on which it was easy to give free rein to fancy. All this, as we have said, was done with the widest eclecticism. But, though nothing really original is met with in the field of apotelesmatics properly so called, there is, all the same, a point on which Arabo-Musalmān astrology is far superior to other astrologies, including the Greek, and represents a real progress. This consists of a wide and continued application of spherical astronomy and of exact mathematical processes to the methods of astrological research. Among the Greek astrologers the calculations are very rough; arcs of the ecliptic are substituted for arcs of the equator, right ascensions for oblique ascensions; rough tables, useful for a determined terrestrial latitude, are also employed for different latitudes; the latitudes of the planets are neglected in the calculation of the radiations ('projectiones radiorum,' *maṭāriḥ ash-shu'ā'*). Among the Greeks we seek in vain for a clear exposition of the method of determining mathematically the 12 heavenly 'domus,' which, however, form one of the hinges of the astrological system. Ptolemy himself, teaching minutely in the *Tetrabiblos* how the 'directio' (ἄφεσις) is calculated, completely neglects the latitude of the planets. Characteristic is the fact that Ptolemy, in the *Almagest*, occupies himself with three problems useful only to astrologers (inclination of the shadow of the eclipses with respect to the ecliptic and to the horizon, position of the stars with respect to the sun in consequence of the daily motion of the sphere, appearances and occultations of the planets with respect to the solar rays), and which even in astrology are of very small importance; and, on the other hand, he does not make the slightest allusion to other problems of spherical astronomy which would be of capital importance for apotelesmatics. Musalmān astronomers, on the contrary, teach exact calculations, and often even prepare tables for all the mathematical problems required by astrology: determination of the 12 celestial houses, 'directio,' 'revolutiones annorum,' 'profectio,' 'projectio radiorum.' Thus astrology, among the Musalmāns, becomes an art which demands a solid scientific preparation, and which tends to give an ever greater mathematical complication and exactness to its methods of research among celestial phenomena. *E.g.*, the *mamarr* ('passage [of one planet over another],' *almanar*, or 'supereminentia,' of our astrologers) corresponds exactly from an apotelesmatic point of view to the καθυπερτέρησις of the Greeks; but whilst for the Greeks this takes place when a planet is situated to the west of another, viz. has a lesser longitude, for the Arabs the *mamarr* takes place when a planet in its own epicycle is distant from the apogee of the epicycle less than another planet is distant from the apogee of its own epicycle. Consequently, its calculation in Musalmān astrology is not a light matter, and requires the employment of complete planetary tables. We can understand, therefore, why the theory of the *mamarr* of the planets is not only expounded in several treatises of spherical astronomy, but has also given rise to special monographs. The importance of all this is plain: in the Hellenistic world astrology flourishes while astronomy decays; in the Musalmān world of the Middle Ages astrology becomes a potent ally of mathematical and observational astronomy.

6. Polemic concerning astrology.—From Islām astrology at first had a much less unfavourable reception than from Christianity. The latter had to combat in the teachings of astrology an entire world of pagan ideas and cults; it had to contend against the concept of necessity, which excluded Christian free will. In the 7th and 8th centuries A.D., however, the pagan elements of astrology were completely modified; they were so entirely hidden under a verbal formalism as to be no longer recognizable; and, on the other hand, orthodox Islām, with its doctrine of predestination, which excluded the freedom of human actions, was, at bottom, not very far removed from the εἱμαρμένη of the Stoics and of many astrologers of antiquity. When we consider that the first Musalmān theologians took no heed whatever of the sciences which did not appear to have any relation to the religious content of Islām, we easily understand how astrology had been able to advance unimpeded through its first stages almost up to the end of the 2nd cent. of the Hijra. It is not, therefore, astonishing that Abū Ma'shar, writing his *Introductorium* in 848 A.D., among the ten categories of persons hostile to astrological teaching, makes no mention whatever of opponents influenced by strictly religious reasons,[1] and he makes his defence of astrology to consist (*Introd.* I. 5, fol. b 2 v.–b 3 v.) only in an amplification of the arguments with which Ptolemy (*Tetrab.* I. 3)

[1] Cf. Nallino, *'Ilm al-falak*, pp. 326–332.

[1] *Introductorium*, I. 4 (Augsburg, 1489, fol. a 7 v.–b 2 v.).

had already maintained the material and moral advantages of foreseeing the future, even if this should appear to be adverse to us. The 'philosopher of the Arabs,' al-Kindī, who died a little after 870 A.D., regards astrology as an integral part of philosophy (*ḥikmah, falsafah*); he seeks its basis not only in the four mathematical, but also in the physical and metaphysical doctrines;[1] and he opposes it to many popular prejudices. Al-Kindī was perhaps the only one who endeavoured to reduce to a completely rational and systematic form the principles and the methods of astrology.

But matters soon underwent a change. Towards the end of the 2nd cent. of the Hijra the knowledge of Aristotle's teaching grew more definite and profound, and in this there was no place for astrology; hence the philosophers commenced to make war against it. On the other hand, the theologians were not slow to see in the influence attributed to the stars over human actions a menace to the severely monotheistic conception of Islām, more especially when later on there filtered into Musalmān theology an opposition to the idea of necessary causality, and the atomistic doctrine of continued creative acts became more prevalent. Moreover, the daring predictions concerning the duration of Islām[2] became an evident danger to dogma. Thus the polemic against astrology became very acute.[3]

The most ancient confutation which we possess is that of **Abū 'l-Qāsim 'Īsā ibn 'Alī**,[4] drawn up in the first half of the 10th cent.,[5] and preserved in a work of the Ḥanbalite theologian, Ibn Qayyim al-Jauziyyah, *Miftāḥ dār as-sa'ādah*.[6]

After an exordium in which he admits that the stars may have some influence on such natural phenomena as climate and temperament, but denounces the practice of foretelling the future by their means, he divides his dissertation into three distinct parts. The first has reference to the discordance among astrologers as to their fundamental principles concerning the nature of the influence of the stars, and an exposition follows of several fundamental principles for astrological calculations on which the various writers disagree—*e.g.*, the method of determining the planetary 'termini,' the 'significator' (*dalīl, ἀφέτης*), the 'pars fortunæ,' the male and female zodiacal signs. The second part consists of the examination of many principles which are affirmed by the astrologers, but which are repugnant to good sense (*mustabsha'*). In the third part 'Īsā ibn 'Alī cites some of the arguments adopted by the astrologers in favour of their science, and refutes them.

Contemporary with 'Īsā ibn Alī is the famous philosopher **al-Fārābī** (*q.v.*; † A.D. 950), who, as a profound student of Aristotle, could not but be opposed to astrology. We have a work of his against astrology,[7] which, however, is not so vigorous a confutation as we should have expected from such a philosopher and contains some childish reasonings. This is explained by the fact that the work is merely a series of notes, published by a disciple just as he found them.

The philosophers contemporary with al-Fārābī did not all share his hostility to astrology; in fact the schools which had been less subject to Aristotelian influence favoured it, as was already the case with al-Kindī.

With reference to this a special place is held by the **Iḫwān as-Safā'**, 'Sincere Companions,' who flourished in al-Baṣrah towards A.D. 950–960, and whose writings set forth the philosophic doctrines of the heretical Bāṭinites, a branch of whom were the Carmaṭians (al-Qarāmiṭah), who towards the end of the 3rd cent. A.H. (9th cent. A.D.) caused political disorders in the 'Irāq, and who founded an independent kingdom in N.E. Arabia which lasted until after A.H. 474 (A.D. 1081–82). The Carmaṭians had reaped great advantage from astrological predictions based on the theory of the great planetary conjunctions.[1] One can therefore understand that the Iḫwān as-Ṣafā' not only admitted, with Aristotle and other Arabic philosophers, that the changes (generation and corruption) of the sublunar world were consequent upon celestial movements, but also that the planets foretell the future and have a direct influence upon the will and the moral character. The great encyclopædic work of the Iḫwān is imbued with those astrological ideas, among which the theory of planetary conjunctions occupies the principal place.

Favourable to astrology also are those other philosophers who lead up to **Abū Sulaimān Muḥammad ibn Ṭāhir ibn Bahrām as-Sijistānī al-Mantiqī**, who, in the second half of the 10th cent., gathered about him at Baghdād a number of learned men for the purpose of discussing various subjects. Notes and summaries of many of these discussions were collected in the *Kitāb al-muqābasāt* of **Abū Ḥayyān at-Tawḥīdī**, a philosopher, mystic, and jurist († after 400 A.H. [A.D. 1009–1010]), about whose orthodoxy there is some suspicion. A record of a meeting in reference to astrology is preserved almost entire in the work already cited of Ibn Qayyim al-Jauziyyah.[2] Some of those present had attacked astrology, declaring it to be useless, since, after so much study and effort on the part of its supporters, it does not succeed in modifying those events which overwhelm both the wise astrologer and the ignorant man. There then rose up several questioners to refute these accusations, and they set themselves specially to explain how predictions can fail in spite of the truth of astrology, and that, in any case, the efforts of astrologers to discover the truth are always noble. Their defence of practical astrology is somewhat weak, and is probably the last that has been made in the field of philosophy.

Avicenna (*q.v.*; † 428 A.H. [A.D. 1037]) contends against astrology, not only in his great encyclopædia, *ash-Shifā'*, 'The Recovery of the Health [of the Soul],' and in the *an-Najāh*, but also in a special work of which a full résumé was made by Mehren.[3] He demonstrates that astrology has no foundation, and proceeds to show that, even admitting its theoretical truth, it would be impossible for men to acquire a knowledge of it.

Averroës (*q.v.*), or Ibn Rushd († 595 A.H. [A.D. 1198]), is also a decided adversary of astrology, as appears from the severe judgment referred to above (§ 3) and from some passages of his comments on Aristotle. But it would be useless to continue the review of the philosophers, who after the 10th cent. A.D. are all in agreement on this question. It is more interesting to consider the position taken up by the theologians, who—from the motives indicated at the beginning of this section—engaged, towards the end of the 9th cent. A.D., in a relentless war against astrological theories.[4]

We have already seen the attitude of **al-Jubbā'ī**. We may add here that **Ibn Ḥazm** († 456 A.H. [A.D. 1064]), who fiercely opposed the scholastic or speculative theology of al-Ash'arī in Spain, gives his ideas on astrology in *Al-Fiṣal fī 'l-milal wa 'l-ahwā' wa 'n-niḥal*.[5] He divides those who believe that the future can be foretold by means of the stars into two classes: (1) misbelievers and polytheists, and (2) persons who are in error. The first are those who maintain that the stars and the

[1] Cf. the quotations in M. Steinschneider, *ZDMG* xviii. [1864] 134; and chs. x. and xi. of the anonymous Latin pamphlet *De erroribus philosophorum* (written in the second half of the 13th cent.), ed. P. Mandonnet, *Siger de Brabant*[2], Louvain, 1908–11, pt. ii. pp. 18–21.

[2] *E.g.*, Theophilus, son of Thomas, the astrologer of the third 'Abbāsid khalīf (see above, § 4), maintained that the reign of Islām would last only 960 years (Ibn Ḫaldūn, *Proleg.*, iib. iii. ch. liv., tr. de Slane, ii. 222 f.). The philosopher al-Kindī calculated that the duration of the kingdom of the Arabs would be 693 years (see O. Loth, 'Al-Kindī als Astrolog,' in *Morgenländische Forschungen, Festschrift an H. L. Fleischer*, Leipzig, 1875, pp. 263–309).

[3] Men like al-Jāḥiẓ († 255 A.H., 869 A.D.) and the famous theologians al-Jubbā'ī († 303 A.H., 915–916 A.D.) and al-Ash'arī († 324 A.H., 936 A.D.) were declared enemies of astrology.

[4] According to Ibn al-Qifṭī, ed. Lippert, p. 244 f., he died on Friday, 28 Rabī' ii., 395 A.H., *i.e.* 28th March, 1001 A.D.; cf. also *Fihrist*, p. 129.

[5] It is, in fact, cited in the preface of the *Libellus isagogicus ad magisterium judiciorum astrorum*, which al-Qabīṣī had written for Saif ad-daulah, prince of Aleppo, who reigned from 333 to 356 A.H. [A.D. 944–967].

heavenly spheres are intelligent beings, agents, of eternal duration, and disposing of earthly things either with or without God. The second are those who hold that the stars and the celestial spheres, whilst without intelligence, have been created and established by God as indicators of things which are to take place.

The preserver of Ash'arite dogmatic theology, **al-Ghazālī** († 505 A.H. [A.D. 1111]), opposes astrology in his *Iḥyā' 'ulūm ad-dīn*, 'The Revival of Religious Sciences.'[1] And the same attitude we find in the books of the famous Ḥanbalite, Ibn Taimiyyah († 728 A.H. [A.D. 1328]).[2]

But the most vigorous and complete confutation of astrology is contained in the *Miftāḥ dār as-sa'ādah* of **Ibn Qayyim al-Jauziyyah** († 751 A.H. [A.D. 1350]),[3] one of the most noted theologians of the Ḥanbalite school. Only the famous work of Pico della Mirandola, *Adversus astrologiam*, can be compared to the 110 closely printed quarto pages of the confutation written by this Muhammadan theologian, whose impassioned polemics press upon the adversary with an infinity of subtle distinctions which prove the force of his dialectic.

In the theological world perhaps the sole defender of astrology is **Faḫr ad-dīn ar-Rāzī** († 606 A.H. [A.D. 1210]), cited above. Famous especially for his great commentary on the Qur'ān, he composed also many theological, philosophical, and astrological works, and studied medicine and mathematics. Without doubt his confidence in astrology is due to his cultivation of the sciences, and this confidence already appears in his commentary on the Qur'ān.

No theologian seems to have followed Faḫr ad-dīn ar-Rāzī in his bold interpretations of Qur'ānic passages and of religious traditions. Besides, after the writings of Ibn Qayyim al-Jauziyyah and his predecessors, polemics about astrology could no longer reckon on any novelty of argument. The considerations developed by the great philosopher of history, **Ibn Ḫaldūn** († 808 A.H. [A.D. 1406]), in his historical *Prolegomena*,[4] are alone deserving of notice.

7. Astrology in common life.—The four orthodox schools of jurisprudence and the Shī'ite school were already in existence when the war of the philosophers and theologians against astrology became fierce; accordingly, the anathema launched against it in the name of religion did not occupy much space in Muhammadan law, notwithstanding the fact that this had its chief foundation in religious doctrine. Among some jurists of a rather later age, however, we meet with open hostility to astrology. In Muhammadan law the buying and selling of useless things is forbidden; therefore some jurists[5] teach that one may not sell or buy books of astrology. Another legal prescript does not admit the testimony of misbelievers; therefore some jurists, regarding the astrologer as a misbeliever, deny him the right of acting as a witness.[6] But, before theological anathema smote it, astrology was deeply rooted among all lay classes of society. The courts of the 'Abbāsid khalīfs at Baghdād and of the numerous small dynasties which arose in the Muhammadan world after the 3rd cent. of the Hijra received astrologers with great favour and consulted them on affairs of State as well as on trifling matters of daily life. At the foundation of Baghdād in A.D. 762, and at that of al-Mahdiyyah (in Tunis) in 916, the astrologers, summoned for the purpose, indicate the propitious moment for beginning the work. Many writings on apotelesmatics are dedicated to khalīfs, sultans, and princes. In Turkey, even at the beginning of the 19th cent., one of the chief posts at court was that of *munajjim-bāshī*, or chief astrologer; and the case was similar in Persia, in India, and in Muhammadan central Asia.[1] In the *Thousand and One Nights* not only is the astrologer with his astrolabe mentioned several times (*e.g.*, Nights 28 and 50 of the Egyptian edd.), but there is also a complete dissertation on the elements of astrology (Nights 254–257, in the story of the slave girl Tawaddud). Further, the considerable number of old Arabic astrolabes still existing in the East and in South Europe would alone suffice to prove the great diffusion of astrology throughout the Muhammadan world; and it found strong support among the students of astronomy. Cases of persecution of astrologers by the State are extremely rare. Al-Ḥākim, Fāṭimid khalīf of Egypt, who in 404 A.H. (A.D. 1013–1014) prohibited the study of astrology and banished from Cairo those who cultivated it, was an astrologer himself, and that decree of his is one of many acts of madness committed in the last years of his life.

In the Muhammadan countries into which European civilization has penetrated (which with the Copernican system has destroyed the bases of apotelesmatics) astrology has lost its importance and remains the monopoly of the popular classes, among whom it has degenerated into a form of prediction without any serious mathematical and astronomical basis. On the other hand, in countries where there is little or no European influence (*e.g.*, in many parts of Morocco) apotelesmatics still flourish, but accompanied by only rudimentary astronomical knowledge. To-day in S. Arabia the function of the astrologer is exercised especially by the *qādī*,[2] *i.e.* by those whose duty it is to see that canon law is observed!

8. Influence on European astrology. — The astrology of the Latin Middle Ages from the beginning of the 12th to the end of the 15th cent. is really Arabic astrology. Its sole sources are Arabic (Albohali, Albohazen, Albumasar, Alcabitius, Alchindus, Almansor, Alphadol, Aomar, Gergis, Hali, Haly Heben Rodan, Messahala, Zahel, and some pseudepigraphical works), or at least translations from Arabic (*e.g.*, the *Tetrabiblos* or *Quadripartitum* of Ptolemy, and the Καρπός or *Centiloquium*); the technical terminology is literal translation or mere corruption of Arabic words. In the 16th cent. the humanists rescued from oblivion the poem of Manilius and the crude compilation of Firmicus Maternus; but this was a mere literary exercise of no importance for the astrology of the 17th century.

In the Byzantine world also Muhammadan astrology leaves deep traces in many versions from the Arabic and from the Persian;[3] so that side by side with the works derived from the classic Greek authors appear those of 'Απομάσαρ (Abū Ma'shar), 'Αχμέτ (Aḥmad ibn Yūsuf ibn ad-Dāyah), Μεσσάλα (Mā shā' Allāh), Σέχλ (Sahl ibn Bishr), and other Arabic writers. Thus there frequently occur in Byzantine astrological writings Arabic and Persian names of planets or technical terms which no longer correspond to those of classical Greek.

[3] The Arabs and the Persians are called indifferently Πέρσαι.

Finally, the Jewish astrological literature of Europe, in which a conspicuous place is occupied by the works of Abrāhām ibn 'Ezrā († 1167), is based exclusively on Arabic sources.

LITERATURE.—There is no work setting forth the content and history of Muhammadan astrology. For biographical and bibliographical notices of individual astrologers reference may be made to H. Suter, *Die Mathematiker und Astronomen der Araber und ihre Werke*, Leipzig, 1900 (completed in 'Nachträge und Berichtigungen zu "Die Math. und Astron.,"' in *Abhandlungen zur Gesch. der mathematischen Wissenschaften*, xiv. [1902] 157–185). The mathematical side of Muhammadan astrology and the explanation of several technical terms are set forth in the present writer's annotations on al-Battānī, *Opus astronomicum*, 3 vols., Milan, 1899–1907. Beyond two or three small pseudepigraphical writings of no importance, printed or lithographed in Cairo, and the dissertation of al-Kindī published by O. Loth (see above, p. 92ᵃ, n. 2), there are no edd. of complete astrological works in the original text; there are, on the other hand, edd. of Middle Age Latin versions (15th–16th cent.), several of which have been cited in the course of the article.

II. *ASTRONOMY.*—1. Name.—The names *'ilm* (or *ṣinā'at*) *an-nujūm*, 'science (or art) of the stars,' *'ilm* (or *ṣinā'at*) *at-tanjīm* denote both astronomy and astrology. For the former science Averroës[1] adopts the expression *ṣinā'at an-nujūm at-ta'ālīmiyyah*, 'mathematical art of the stars,' which is found also in the original Arabic of the *de Scientiis* of al-Fārābī, where Gerard of Cremona translated it by 'astronomia doctrinalis,' misled by the double signification of the adjective *ta'ālīmī*. The astronomy of observation is designated by Averroës[2] *ṣinā'at an-nujūm at-tajrībiyyah*, 'experimental art of the stars.' Special names of astronomy are *'ilm al-hai'ah*, 'science of the form [of the universe],' and *'ilm al-aflāk*, 'science of the celestial spheres.'[3] The branch of astronomy which deals with the construction and use of instruments for determining the time, especially for the purpose of regulating the times of the religious services in the mosques, is named *'ilm al-mīqāt*, 'the science of the time appointed [for the canon prayers],' and he who cultivates it is called *muwaqqit*.

2. Scope.—The Greek and Muhammadan conception of astronomy does not exactly correspond to the modern conception.

Al-Fārābī says in his treatise *de Scientiis*[4] that astronomy has for its object the study of the celestial bodies and of the earth from these three points of view: (*a*) number, figure, order, and respective position of the spheres and of the celestial bodies; their magnitudes and distances from the earth; immobility of the earth; (*b*) celestial motions and their consequences with regard to the stars themselves (conjunctions and oppositions, eclipses, etc.); (*c*) magnitude of the inhabited part of the earth and its division into zones or climates; determination of geographical co-ordinates; effects of the rotation of the celestial sphere in regard to parts having different latitudes (varying length of the day, right and oblique ascensions of the points of the ecliptic, etc.). This scheme of the content of astronomy is found also in later writers,[5] with the sole difference that the study of the magnitudes and distances of the celestial bodies and spheres comes to be considered under a category (*d*) separate from (*a*).

According to Avicenna, the astronomer studies 'the parts of the universe as far as regards their figure, their respective positions, their magnitudes, and their distances from each other; he further studies the motions of the spheres and of the celestial bodies, the estimate (*taqdīr*) of the globes, of the axes (*l. quṭūb*) and of the circles [ideal] on which those motions take place. All this is contained in the *Almagest*.'[6]

The limits of astronomy are well defined by Ibn Ḫaldūn († A.D. 1406):

Astronomy consists of the study of the celestial bodies and motions as they appear to us; 'it is a most noble science, but it does not give, as is often supposed, the form of the heavens and the disposition of the spheres and of the stars as they are in reality. It only indicates that from those motions there result for the spheres these forms and these dispositions. Now, as is known, it is not strange that from one and the same thing there should result necessarily two different things; therefore, when we say that those motions give as a result [those celestial configurations], we seek to argue the mode of existence of the result by means of the necessary cause; a proceeding which does not at all guarantee the truth. Nevertheless, astronomy is an important science, indeed one of the fundamental parts of the mathematical sciences.'[1]

The diversity of criteria and of purposes by and for which the physicist ('naturalis') studies celestial phenomena, in contrast to the astronomer ('astrologus'), is shown also in a passage of Averroës.[2] This conception of the philosophers is shared by the Muhammadan astronomers, for whom astronomy embraces spherical astronomy (with the theory of instruments), mathematical chronology, spherical trigonometry, and geography as based on mathematics (like that of Ptolemy); and it excludes all that for us would enter into the field of stellar physics and celestial mechanics. This is evident from the summary[3] of the best systematic treatise on Muhammadan astronomy, viz. the unedited *al-Qānūn al-mas'ūdī*, composed in Arabic by al-Bīrūnī († A.D. 1048):

(*a*) General notions and fundamental hypotheses for the geometrical representation of celestial phenomena; (*b*) mathematical chronology, conversion of one era into another, festivals of various peoples; (*c*) spherical trigonometry; (*d*) circles of the celestial sphere and systems of co-ordinates; phenomena of the diurnal motion of the sphere with reference to the earth (amplitudes, solar altitudes, right and oblique ascensions of the points of the ecliptic, etc.); (*e*) form, dimensions, etc., of the earth; problems relating to terrestrial longitudes and latitudes; the direction of Mecca with regard to other places on the earth; geography on a mathematical-astronomical basis; (*f*) theory of the sun; (*g*) theory of the moon; solar and lunar parallaxes; (*h*) syzygies, eclipses, appearance of the new moon; (*i*) fixed stars and lunar stations; (*j*) theories of the five planets; geocentric distances and magnitudes of the celestial bodies and spheres; (*k*) problems of spherical astronomy as subserving astrology (calculation of the twelve celestial 'domus,' of the 'applicationes,' of the 'projectiones radiorum,' of the 'directiones' and 'profectiones,' of the 'revolutiones annorum,' of the *mamarr*, of the planetary conjunctions, of the millenary periods).

Muhammadan astronomical writings, almost always in Arabic, can be classified under four groups:

(*a*) General elementary introductions which represent a perfected form of what the *Isagoge* of Geminus and the *Hypotheses* of Ptolemy were for the Greeks; belonging to this category—to cite only writings translated into European languages and edited—are: the *de Imaginatione Sphæræ* of Thebit (or Thābit) ibn Qurrah († A.D. 901), the compendium of Alfraganus or al-Farghānī († after 861), and the compendium of al-Jaghminī († 1344–45);[4] (*b*) systematic treatises corresponding in type to the *Almagest*, but more perfect—*e.g.*, the unedited work of al-Bīrūnī cited above; the Latin translation of the *Almagest* of Geber (or Jābir) ibn Aflaḥ, printed at Nürnberg, 1534, would belong to this category if it had not omitted all the mathematical and astronomical tables; (*c*) treatises of spherical astronomy for the use of calculators and observers; these are called *zīj* (plur. *zījāt*, *azyāj*, *ziyajah*); they presuppose a knowledge of the general principles of cosmography and consist essentially of tables for calculation, illustrations of the use of the tables, and indications as to the manner of solving problems of spherical astronomy (for the most part without demonstration); the only treatise of this kind published and translated is that of al-Battānī;[5] of the Persian treatise of Ulūgh Beg only the prolegomena (explaining the use of the tables) and the stellar catalogue have been edited and translated; (*d*) writings on special subjects—*e.g.*, stellar catalogues, treatises on instruments, etc.

[5] To which is to be added the Latin translation, made in the 12th cent. by Athelhard of Bath, of Maslamah al-Majrīṭī's recension of the tables of al-Ḫuwārizmī, ed. with an excellent German commentary by H. Suter, 1914.

3. Relation to Islām.—Muhammadan religious ritual bases some of its prescriptions on elements of an astronomical character. The hours within which each of the five daily ritual prayers is valid depend on the latitude of the place and on the epoch of the solar year; further, the legal time for the night prayer is between the end of the evening and the beginning of the morning twilight. The ritual prayer is not valid unless the face is turned in the direction of Mecca; hence the necessity of solving the astronomical-geographical problem of the azimuth of Mecca. The beginning and the end of the month assigned to the fast are determined not by the civil calendar, but by the actual appearance of the new moon; and the beginning of the daily fast is given by the morning twilight. Finally, special ritual prayers are prescribed at eclipses of the sun and moon, for which it is well to be prepared in time. All this presupposes a certain degree of astronomical knowledge; and, although the majority of theologians and jurists are not content with pure calculation for the appearance of the new moon, but require the actual sight of the phenomenon, it is evident that the religious precept must be a real stimulus to scientific study. This explains also why the Muhammadans have undertaken so much research into the complex phenomena of the twilight and of the conditions of visibility of the new moon—phenomena which were almost entirely neglected by the Greek astronomers. On the other hand, many passages of the Qur'ān set forth the benefits which God has vouchsafed to men by means of celestial bodies and motions; at least they invite reflexion on the goodness and providence of God. Astronomy thus becomes an ally of religion.

4. Sources.[1]—(*a*) *Arabian.*—A first element of an exclusively practical character is due to the Arabs before Islām. Like all other peoples who dwell in hot countries and are compelled to prefer night to day for travelling, the Bedawin made use of the stars for guiding their wanderings and for calculating (approximately) the hours of the night; they were thus familiar with the principal appearances of Venus and of Mercury, the places of the rising and setting of the more brilliant stars, and above all the annual course of the moon determined by noting its position in relation to 28 successive groups of stars called for this reason *manāzil al-qamar*, 'lunar stations.' Further, among the sedentary agricultural tribes, the seasons and many meteorological provisions (especially those for rain) were strictly connected with the annual rising of certain fixed stars[2] or else with the cosmic setting of the lunar stations. Hence, even in the 16th and 17th centuries, Arabic writers on astronomy still occupied themselves with the lunar mansions[3] and their *anwāʾ*, or cosmic settings.

(*b*) *Indian.*—The Muhammadans owe the first scientific elements of astronomy to India. In 154 A.H. (A.D. 771),[4] there came to Baghdād an Indian embassy one learned member of which introduced to the Arabs the *Brāhmasphuṭasiddhānta*, composed in Sanskrit in A.D. 628 by Brahmagupta. From this work (which the Arabs called *as-Sind-hind*) Ibrāhīm ibn Ḥabīb al-Fazārī drew the elements and the methods of calculation for his astronomical tables (*zīj*) adapted to the Muhammadan lunar year. Almost contemporaneously Ya'qūb ibn Ṭāriq composed his *Tarkīb al-aflāk*, 'The Composition of the Celestial Spheres,' which was based on the elements and methods of the *Brāhmasphuṭasiddhānta* and on other data furnished by another Indian scientist (K.n.k.h), who came to Baghdād with a second embassy in 161 A.H. (A.D. 777–778). It seems that almost at the same time there was translated into Arabic under the name *al-Arkand* the *Khaṇḍakhādyaka*, written about A.D. 665 by the same Brahmagupta, but containing elements different from those of his other work. Abū 'l-ḥasan al-Ahwāzī, a contemporary of al-Fazārī and of Ya'qūb ibn Ṭāriq, probably drawing on oral teachings of learned Indians, introduced to the Arabs the planetary motions according to al-Arjabhad (a corruption of Āryabhaṭa, the name of an Indian astronomer who wrote in A.D. 500). These Indian works had many imitators in the Muhammadan world up to the end of the first half of the 5th cent. of the Hijra (11th cent. A.D.); some astronomers (*e.g.*, Ḥabash, an-Nairīzī, Ibn as-Samḥ) wrote contemporaneously books based on Indian methods and elements and books with Græco-Arabic elements; others (*e.g.*, Muḥammad ibn Isḥāq as-Saraḥsī, Abu 'l-Wafāʾ, al-Bīrūnī, al-Ḥāzinī) adapted elements calculated by the Muhammadan astronomers to great artificial cycles of years constructed in imitation of those of the Indians. For one of the characteristics of the astronomical books of India is their representation of the mean motions of sun, moon, and planets by the number of their revolutions in cycles of millions of years, starting from the supposition that at the beginning of creation sun, moon, and planets were all in conjunction in a given degree of longitude (*e.g.*, at the first point of Aries), taken as the initial point of the celestial sphere, and that at intervals of millions of years they will all be in conjunction again at the same point.[1] Further, many treatises composed by the Arabs gave the roots of the mean motions for the meridian of Uzain (corrupted later into Azīn and Arīn, the Sanskrit Ujjayinī), supposed to be the central meridian of the inhabited earth (90° E. of the first Ptolemaic meridian). From those Indian books the Arabs also derived their first knowledge of trigonometrical sines, of course in the form employed in India, *i.e.* for arcs of 3° 45′ and for the radius of 3438′.

(*c*) *Iranian.*—A few years after the introduction of Indian astronomy, and before the end of the 8th cent. A.D., there was translated into Arabic the Pahlavī work entitled *Zīk i Shatroayār*, 'Astronomical Tables of the King,' a name which became in the Arabic version *Zīj ash-Shāh* or *Zīj ash-Shahriyār*. The original was certainly composed in the last years of the kingdom of the Sāsānids, since the tables were based on the epoch of Yazdagird III. (16th June, A.D. 632); its elements were derived, not from Persian observations, but from Indian books. It appears also that the roots of the mean motions were referred to the meridian of the mythical castle Kangdizh, which Persian epic legend placed in the Far East. The Arabic version met with great favour among the Muhammadans. We know that the astronomer and astrologer Mā Shāʾ Allāh († at the beginning of the 9th cent. A.D.) made use of it for his calculations, that in the first half of the 9th cent. Muḥammad ibn Mūsā al-Ḫuwārizmī had deduced from it the equations of the planetary motions, whilst he had drawn the mean motions from the *as-Sind-hind* and other elements from Ptolemy, and that Abū Maʿshar († A.D. 886) used it for his astronomical tables. After the 9th cent. A.D. the *Zīj ash-Shāh* rapidly fell into disuse; but a passage of az-Zarqālī (Arzachel) shows that towards the middle of the 11th cent. some astrologers in Spain still calculated the longitude of the fixed stars according to the tables of the Persians.

(*d*) *Greek.*—Last in chronological order is the influence of Greek astronomy. At the end of the 8th cent. or at the beginning of the 9th A.D. a rich patron, of the family of the Barmecids, Yaḥyā ibn Ḫālid († 191 A.H. [A.D. 807]), caused the *Almagest* to be translated for the first time into Arabic. But this book, full of difficulties and obscurities, could not, at first, compete with easier and more practical works of Indian and Persian origin. It acquired influence later, when the mathematical preparation of the Muhammadans was more advanced, and when better translations appeared. In the first half of the 9th cent. also Arabic translations were made of the *Geographia*, the *Tabulæ Manuales*, the *Hypotheses Planetarum*, the *Apparitiones* (φάσεις) *Stellarum fixarum*, and the *Planisphærium* of Ptolemy; the *Tabulæ Manuales* of Theon of Alexandria; the book of Aristarchus on the magnitudes and distances of the sun and moon; the *Isagoge* of Geminus; two tractates of Autolycus; three of Theodosius; and the little work of Hypsicles on the ascensions. To the 9th cent. also probably belongs the Arabic translation of the astronomical tables of Ammonius, of which we still find traces in the 11th cent., when they were remodelled by az-Zarqālī, to pass afterwards into mediæval Latin literature under the names of Humenus, Armanus, etc. Finally, there appear to have been translated in the same century the book of the constellations of Aratus and a book on the magnitudes and distances of the celestial bodies, which, falsely attributed to Ptolemy, is known by the Arabs under the name of *Kitāb al-manshūrāt*.

5. Some astronomical teachings.—We may here refer to some special points, which have an importance for the history of the general ideas of celestial phenomena. The only system received by the Muhammadan peoples was the geocentric. Aristotelian philosophy, the authority of Ptolemy, and the requirements of astrology were insurmountable obstacles to the conception of a heliocentric system, which, in any case, could not have been demonstrated by irrefutable reasons or, in the absence of telescopes, have procured any real advantage to practical astronomy. The lack of telescopes kept Muhammadan astronomers from becoming acquainted with other planets than those already known to the Greeks. The mode, too, of representing their motions is always that of the Greeks, viz. by means of combinations (sometimes very complicated) of eccentrics and epicycles; nor

[1] For details see Nallino, *'Ilm al-falak*, pp. 104–140, 313–323 (for Arabic sources), 149–180 (Indian), 180–188 (Persian), and 216–229 (Greek).

[2] Alois Musil and Antonin Jaussen have found this usage still in vogue among the Bedawin of Moab. Eduard Glaser indicates it for the Yemen.

[3] These correspond only approximately to the *nakṣatras* of the Indians.

[4] So al-Bīrūnī. On the other hand, Ibn al-Qifṭī (a source of less authority) has 156=773.

[1] This Indian idea occurs also in some Arabic works which are not astronomical—*e.g.*, Ibn Qutaiba, *Liber poësis et poëtarum*, ed. M. J. de Goeje, Leyden, 1904, p. 503 f.

do the modifications of certain parts of the planetary theories of Ptolemy introduced by some (*e.g.*, Naṣīr ad-dīn and Quṭb ad-dīn ash-Shīrāzī) depart much from this principle. Only among writers who are philosophers rather than astronomers do we meet with theories that supersede those of eccentrics and epicycles.[1] In any case, among them all, the Aristotelian and Ptolemaic doctrine of the circular form of celestial motions reigns supreme, for the elliptic orbit indicated by az Zarqālī for Mercury[2] is merely a graphical construction on the lamina of the astrolabe, and not a theoretical representation.

(*a*) *Number of the spheres.*—The number of the spheres, *i.e.* of what in the Middle Ages in Europe were called 'heavens,' is eight in Aristotle and Ptolemy, viz. seven for the planets (including the sun and the moon) and one for the fixed stars. This number of eight is preserved by the first Arabic astronomers—*e.g.*, al-Farghānī and al-Battānī, for whom, however, these ideal spheres, created to satisfy the requirements of physics and not those of astronomy properly so called, had no practical importance. Still the number of eight, combined with the Aristotelian theory of solid spheres in which the heavenly bodies are infixed without being able to move themselves, did not easily agree with the other teachings of the Ptolemaic system. Aristotle, who was ignorant of the motion of the precession of the equinoxes, and who consequently held that the fixed stars are really immovable, assigned to the eighth sphere the apparent diurnal motion of the celestial vault from east to west, a motion which the eighth sphere impressed also on all the others. But Ptolemy, accepting from Hipparchus the precession of the equinoxes on account of which the fixed stars have a slow and continued increase of longitude, came implicitly to attribute to the sphere of the fixed stars two motions in opposite directions—one (diurnal) from east to west, and the other from west to east. Ptolemy had no occasion to notice and correct this contradiction, which was soon perceived by the Arabic writers. The contradiction would have been easily eliminated by supposing that the fixed stars moved by the precessional motion within their own sphere, supposed accordingly to be fluid and not solid; and perhaps al-Battānī had in mind the possibility of this hypothesis when he entitled ch. li. of his book[3] thus: 'Of the motion of the fixed stars, whether they move in their sphere, or whether the sphere moves with them.' Another solution of the difficulty would have been to suppose the fixed stars to be infixed in the convexity of the sphere of Saturn, itself naturally subjected, like all the planetary apogees, to the motion of the precession; then the eighth sphere, no longer containing the stars, would only have had the office of impressing the diurnal motion on the spheres below. This solution was actually given by Muhammadan writers, some of whom indeed took advantage of it for reducing the number of the spheres to seven, to conform with the seven heavens of the Qur'ān; but this was never accepted by the astronomers.[4] Therefore, when Ibn al-Haitham († 1039) introduced into pure astronomical teaching the doctrine of the solid spheres of Aristotle, it was necessary for the physical reasons set forth above to add a ninth sphere without stars, impressing on the other spheres diurnal motion. This ninth sphere, accepted by all the later astronomers, was called 'the universal sphere,' 'the greatest sphere,' 'the sphere of the spheres,' 'the smooth sphere' (*al-falak al-aṭlas*), 'the sphere of the zodiac,' 'the supreme sphere.' In general also the philosophers—*e.g.*, Avicenna and Ibn Ṭufail—accept these nine spheres; Averroës,[1] however, under the influence of Aristotle, cannot bring himself to exceed the number of eight. In the theological camp the nine spheres did not find many opponents, in spite of 'the seven heavens' mentioned in *Qur.* ii. 27; it was held that the specification of the number seven did not imply the negation of a superior number.[2] In fact, several theologians saw in the eighth and ninth spheres respectively the 'seat' (*kursī*) and the 'throne' (*'arsh*) of God mentioned in the Qur'ān.[3]

Doubts were not wanting, however, concerning the unity of the sphere of the fixed stars. Faḫr ad-dīn ar-Rāzī[4] informs us that Avicenna, in his book *ash-Shifā'*, declared: 'Up till now it has not been clear to me whether the sphere of the fixed stars be a single sphere or be several spheres, placed one above the other.' And Faḫr ad-dīn ar-Rāzī[5] adds that the hypothesis of the single sphere for all the fixed stars rests only on the assumption of the equality of their motions, but that this equality is not at all certain. He further says that, even if the equality of the motions were a certainty, he would not deduce from it the necessity of a single sphere bearing all the stars infixed in it. In face of these criticisms, one comprehends the scepticism of Niẓām ad-dīn al-Ḥasan an-Naisābūrī: 'In conclusion, to none of the ancients or of the moderns is the number of the heavens quite certain, either by the force of reasoning or by the way of tradition.'[6]

(*b*) *Order of the planets.*—The order of the planets followed by almost all the Muhammadan astronomers is identical with that of Ptolemy, although they recognize, together with the Greek astronomers, the lack of absolute proofs in the case of the two inferior planets and the sun. Without telescopes they could not see the transits of Venus and Mercury across the sun or determine the parallaxes of the planets situated above the moon. Some Arabic authors believed that they had perceived transits of Venus or of Mercury across the sun; but what they really saw was solar spots.[7] On the other hand, the postulates of astrology continued in the Muhammadan age to guarantee, from lack of scientific reasons to the contrary, the Ptolemaic series: moon, Mercury, Venus, sun, Mars, Jupiter, Saturn. Spain alone had astronomers who departed from this order. Jābir ibn Aflaḥ (*c.* 1140) held it more probable that Mercury and Venus were above the sun on account of their analogy to the superior planets in having epicycles and eccentrics, stations and retrogradations. Al-Biṭrūjī (*c.* 1200), moved by physical reasons connected with his special system of planetary notions, placed the sun between Mercury and Venus.

(*c*) *Obliquity of the ecliptic.*—The obliquity of the ecliptic with regard to the celestial equator is one of the fundamental elements of astronomical calculation. The Greeks, from Eratosthenes (230 B.C.), had assigned to it the constant value of 23° 51′ 20″; *i.e.*, they held it to be invariable. The astonishment of the Arabic astronomers must have been great when they found by their observations an obliquity sensibly less; at first they could not decide whether the discrepancy was due to a real diminution of the obliquity or to a defect in the ancient observations. Al-Battānī leaves the ques-

tion undecided and declares that he chooses the excellent value found by himself (23° 35′), 'since this was observed by us with our own eyes; the other, on the contrary, was received through the information of others.'[1] Some, less prudent, deduced the theory of libration[2] from the discrepancies as to the obliquity of the ecliptic combined with those relative to the precession of the equinoxes. But the continued series of observations left no doubt by the 13th cent. that the obliquity of the ecliptic was subject to a very slow regular diminution,[3] which therefore came to be admitted by all the astronomers; in Europe, on the other hand, we must come down to Tycho Brahe (1546–1601) to see it affirmed in the midst of opposition which lasted through the greater part of the 17th century. The Muhammadan astronomers had no means of determining whether this diminution was continuous or periodical and within what limits it was contained.[4] Abū 'Alī al-Ḥasan (*c.* 1260), who had accepted the hypothesis of az-Zarqālī as to libration, believed that the obliquity oscillated between a maximum of 23° 53′ and a minimum of 23° 33′; Fakhr ad-dīn ar-Rāzī[5] admitted a continuous diminution on account of which the ecliptic will coincide one day with the equator and then will depart from it again, so that the Tropic of Cancer will pass to the south and that of Capricorn to the north. Naṣīr ad-dīn aṭ-Ṭūsī († 1274 A.D.) confined himself to setting forth the eight possible hypotheses as to the continuity or the periodicity of the diminution, without giving preference to any.

(*d*) *Precession of the equinoxes.*—The precession of the equinoxes, on account of which the equinoctial points retreat from east to west along the equator and cause a continuous increase in the longitude of the fixed stars (calculated precisely from the point of the vernal equinox or the first point of Aries), is one of the greatest discoveries of Hipparchus, accepted by Ptolemy. It was accepted by all the Muhammadan astronomers, who, from the first half of the 9th cent., assigned it a value much more exact than that of Ptolemy (36″ yearly), viz. 54″ 33‴; later, a continued series of observations indicated other values still more approximate to the true one. There remained a question which celestial mechanics alone has been able to solve with certainty: Is the precession to be regarded as continuous, so that in many thousands of years the retreating equinoctial points will accomplish the entire circuit of the ecliptic, or is it confined within limits so as to be reduced to one oscillation, more or less great, of the equinoctial points? The first hypothesis, which is the true one, is accepted by Ptolemy; the second was followed by some Greek astrologers after the Christian era, who held that the equinoctial points, after having advanced 8° in 640 years, retreated 8° in a similar lapse of time, returning thus to the primitive point. According to them, the precession was 45″ a year. Finally, it is necessary to note that, while some Indian writers are quite ignorant of the precession, others admit it in an oscillatory form with arcs of 54° or 48° (namely, 27° or 24° from the one part and from the other of ζ Piscium), which they imagined by gross mistakes and not for scientific reasons.

(*e*) *Hypothesis of libration or trepidation.*—The great majority of Muhammadan astronomers held that there was a continuous precession, rightly attributing the discrepancies concerning its value to the imperfection of the observations of the Greeks. We know only three writers of the second half of the 9th cent. who, through Indian influence, accepted the idea of the oscillatory precession in the empirical form of the Greek astrologers mentioned above and of the Indians. On the other hand, Thābit ibn Qurrah († 901) suggested that the discrepancies in the estimate of the annual precession were due in reality to an apparent irregularity of that motion, and that they were connected with the discrepancies relative to the obliquity of the ecliptic. In an epistle which is preserved by Ibn Yūnus he says that he had up till then kept his own calculations private, because he regarded them as uncertain and only provisional. It seems that these secret papers formed the tractate which has come down to us only in two unedited Latin translations under the title *De motu octavæ sphæræ* or *De motu accessus et recessus.*[1] In this tractate Thābit notes that, if all the known observations were exact, there would be a slackening and an acceleration in the motion of precession and in the increase and diminution of the obliquity of the ecliptic. In order to explain these apparently irregular variations, he proposes the following hypothesis:

> The eighth sphere, viz. that which contains the fixed stars, has a movable ecliptic, the extremities of whose axis rotate about the equinoctial points of an ideally fixed ecliptic inclined 23° 33′ in respect of the equator; the complete rotation on those two small circles, having 4° 18′ 43″ of radius, is accomplished in 4171½ lunar years. In this period the equinoctial points would seem to accomplish, with a motion not uniform, an oscillation of 21° 30′ (10° 45′ forwards and the same backwards); in a similar time there will take place an unequal variation of the obliquity.

The hypothesis of Thābit was received in its entirety in Europe by Purbachius (1423–62) and by his commentators Reinhold and Nonius. The oscillation of the equinoctial points is called by the Arabs *ḥarakat al-iqbāl wa 'l-idbār*, 'motion of advance and of retreat,' whence the Latin name *motus accessus et recessus*; this was also called in Europe *motus octavæ sphæræ*, in contradistinction to the motion of the ninth sphere, to which was attributed the motion of the continuous precession; finally, since the longitude of the fixed stars underwent the same oscillations of the equinoctial points, it was often called in Europe *trepidatio fixarum*. This does not seem to have had supporters among the Muhammadans of the East after the 11th century. It had greater fortune among the Muhammadans of the extreme West (Spain and Morocco). Towards 1060–70, at Toledo, az-Zarqālī, in order to make his observations agree with those of his predecessors, suggested that the poles of the ecliptic circulated about the equatorial poles, so that the equinoxes advanced by one unequal motion towards the east about 10° and then retreated irregularly by 20°, accomplishing, *i.e.*, an oscillation of 10° forwards and 10° backwards with reference to an equinoctial point ideally fixed. Every arc of 10° would have been passed over in 750 years, so that the complete cycle of the libration would be accomplished in 3000 years. The hypothesis of az-Zarqālī, explicitly denied by Averroës,[2] was accepted by al-Biṭrūjī (*c.* 1200) in Spain and by Abū 'Alī al-Ḥasan (*c.* 1260) in Morocco; it also found great favour among the Jews and Spanish Christians and had an influence on the Hebrews, who, on a basis of Arabic sources, compiled about 1270 the *Tabulæ Alphonsinæ*.[3]

(*f*) *Motion of the solar apogee.* — Ptolemy (followed by all the later Greeks) says that he found the longitude of the solar apogee to be equal to that observed by Hipparchus, and consequently believes that it is immovable at 65° 30′, while the apogees of the five planets move with the motion of the precession. It is a merit of the Arab astronomers of the khalīf al-Ma'mūn (813–833) that they recognized that the solar apogee is subject to the

[1] Ed. Nallino, i. 12.
[2] See below, § (*e*).
[3] This was already the opinion of Ḥāmid al-Ḥujandī, about A.D. 1000.
[4] Only in the second half of the 18th cent. has celestial mechanics been able to establish the fact that it is a question of a very slow oscillation contained within limits of less than 2½°.
[5] *Mafātīḥ al-ghaib*, i. 260, ii. 59 f.

[1] A suspicion arises, however, that this tractate may rather be by a grandson of Thābit, viz. Ibrāhīm ibn Sinān ibn Thābit, who wrote concerning libration (as al-Bīrūnī and Qāḍīzādeh attest).
[2] *Metaphys.* p. 66 (Quirós, bk. iv. § 15).
[3] It must be noticed that these Hebrews combined the hypothesis of Az-Zarqālī with fantastic elements; viz. they admitted a continuous precession accomplishing the circuit of 360° in 49,000 years (*i.e.* just about 26″ 27‴ a year), which precession was to be always corrected on the basis of an inequality accomplishing its own period in 7000 years. They evidently wished to introduce into the hypothesis of trepidation Judaic elements —a thousand jubilary periods of 49 years and a thousand sabbatical periods of 7 years!

motion of the fixed stars and of the planetary apogees, *i.e.* to the displacement of longitude due to the precession of the equinoxes. But the solar apogee has also another very small proper motion in longitude which, according to Leverrier, is only 11·464″ yearly. This motion must have escaped the Muhammadan astronomers. The determination of the longitude of the apogee is not easy and, in times when telescopes and pendulum-clocks were lacking, could not be effected with absolute certainty in the minutes of arc; on the other hand, there was no term of comparison with ancient observations. One understands, therefore, why the majority of Muhammadan astronomers did not give to the solar apogee any other motion than that of the precession, attributing the small discrepancies to the imperfection of instruments and observations. It seems that Thābit ibn Qurrah, however, had dared to affirm the existence of a *proper* motion. Al-Bīrūnī[1] informs us that Thābit, author of a tractate on the inequality of the solar year, had determined 365 days, 6 hours, 12 minutes, 9 seconds, as being the length of the year which we call anomalistic, *i.e.* the time which the sun takes to return to its own apogee. If, then, the same Thābit (if we may rely upon a piece of information which Regiomontanus and Copernicus seem to have derived from the *De motu octavæ sphæræ* cited above) determined the length of the sidereal year as 365 d., 6 h., 9 m., 12 s., it is plain that he must have attributed to the solar apogee a small proper motion added to that of the precession.[2] Certainly the values found by Thābit are excellent, since, according to the moderns, the anomalistic solar year is 365 d., 6 h., 13 m., 54·9 s., and the sidereal year 365 d., 6 h., 9 m., 10·7 s. It is beyond doubt that az-Zarqālī determined with great exactness ($12\frac{1}{2}\frac{1}{60}\frac{2}{60}''$ every Julian year) the proper motion of the apogee, as distinguished from that due to the precession; and he therefore supposed that the centre of the eccentric of the sun moved over a very small circle, and by this was also settled the variation of the eccentricity of the solar orbit. Among us the proper motion of the apogee was discovered only in the 16th cent. by Kepler and Longomontanus.

(*g*) *Third lunar inequality.*—We need not notice other modifications of special points of Ptolemaic doctrines. It will be enough now to make a reference to a controversy carried on from 1836 to 1871 in the Academy of Sciences of Paris without any definite conclusion being arrived at, viz.: Is the discovery of the variation or third lunar inequality to be ascribed to Abū 'l-Wafā' († 998), as L. A. Sédillot maintained, rather than to Tycho Brahe? There would have been no reason for this dispute if that part of the *Almagest* relative to the movements of the moon had been better studied, and if the analogous discussions in the works of other Arabic astronomers had been examined with care. Carra de Vaux[3] has demonstrated that the hypothetical theory of the variation was nothing else than the *πρόσνευσις* of Ptolemy, *i.e.* the difference between the true and the mean apogee of the epicycle by which difference the mean anomaly is corrected so as then to calculate the simple equation of the moon. Al-Battānī opportunely calls it 'equation of the anomaly.' It is curious to note that no one has observed that already in 1645 Bullialdus (I. Boulliau) had recognized that the *πρόσνευσις* corresponded to about half of the 'variation' of Tycho Brahe, and that consequently the tables of Ptolemy for the moon were sufficiently near to the truth.

6. Opposition to Ptolemy.—The many modifications of the doctrines of the *Almagest* never abandon the geometrical foundation followed by Ptolemy for the representation of the motions of the sun and planets, viz. a combination of eccentric circles and epicycles. This permitted the representation of celestial motions with all the exactness of which astronomical instruments were capable before the discovery of pendulum-clocks and telescopes; it was further obedient to the Aristotelian principle that celestial motions are circular only. Practical astronomy therefore did not feel the need of theories based on different geometrical principles. The difficulty arose only from a physical point of view, since the idea of numerous circular motions round an imaginary point was repugnant to the principles of Aristotelian physics. It was precisely in the name of Aristotelian natural laws that the battle began among the Arabs of Spain in the 12th cent. against the eccentrics and epicycles of Ptolemy; but their opponents were philosophers.[1]

The first of these was Abū Bakr Muḥammad ibn aṣ-Ṣā'igh, known by the name of Ibn Bājah or Avempace († 1139), who is said to have explained the celestial motions by means of eccentrics only, rejecting the epicycles as repugnant to the physics of Aristotle; but we have no particular account of his system.[2] After him we find Abū Bakr ibn Ṭufail (*q.v.*; † 1185–86), famous in Europe for his *Philosophus autodidactus*, who said to al-Biṭrūjī that he had found a theory of those motions quite different from that of Ptolemy rejecting both eccentrics and epicycles, and that he had promised to put it in writing. But it seems that the promise was not fulfilled. The ideas of Ibn Ṭufail probably influenced his friend Averroës (*q.v.*; † 1198), who affirms[3] the physical impossibility of the geometrical hypothesis of Ptolemy. The astronomers, he continues, assign an eccentric to the moon because, since she is eclipsed now more and now less in one and the same point of the zodiac, they suppose that she traverses the cone of shade at different distances with regard to the earth. 'But this may happen also on account of the diversity of her position, if we imagine that the poles of the lunar sphere move around the poles of another sphere. If God shall prolong our life, we will investigate the astronomy of the time of Aristotle, since this seems not to contradict physics; it consists of motions which Aristotle calls *laulab* [*i.e.* spirals]. I believe that this motion consists in this, that the poles of one sphere move about the poles of another; since then the motion [resulting] is according to a line *leulebia* [*i.e.* spiral], just so is the motion of the sun [combined] with the diurnal motion [of the celestial sphere]. Perchance it is possible by means of such a motion to represent the inequalities which take place in the planetary motions.'

In his commentary on the *Metaphysic*, xii. 47,[4] Averroës does not succeed in forming a clear idea of the system of Eudoxus from the scanty allusions of Aristotle and from the commentary of Alexander of Aphrodisias, which is very defective in this part, it not being clear in what manner the 'motus gyrativi'[5] arise from two contrary motions, unless two different poles be supposed.[6] He observes that by this hypothesis one could explain all the appearances of the planets: 'et iste motus, ut mathematici Hispaniæ dicunt, existit in orbe stellato, et vocant ipsum motum processus et reversionis.'[7]

Although Averroës did not complete his exposition,[8] he had guessed a notable part of the hypothesis of Eudoxus (*c.* 409–356 B.C.), which was for the first time reconstructed by G. Schiaparelli in 1875. Averroës, like Eudoxus, allows only spheres concentric with the earth; he admits that the line *laulabī* may be the apparent result of two contrary circular motions—one of the sphere of the planets, and the other, in an opposite direction, of another sphere whose axis is inclined in respect of the axis of the first sphere; finally, the line *laulabī* corresponds to the *ἱππoπέδη* of Eudoxus, in the form of ∞, which, according to the Greek geometricians, belongs to the category of spiral lines (*σπεῖραι*), and, according to modern geometricians, would

[1] *Chronology of the Ancient Nations*, Eng. tr., London, 1879, p. 61 f.

[2] The fact that Thābit wrote a tractate to maintain that the solar apogee does move is of no importance, since it is probably merely a confutation of the Ptolemaic immobility.

[3] 'L'Almageste d'Abû 'l-Wéfa al-Bûzdjânî,' in *JA* VIII. xix. [1892] 440–471.

[1] Cf. L. Gauthier, 'Une Réforme du système astronomique de Ptolémée tentée par les philosophes arabes du xiie siècle,' in *JA* X. xiv. [1909] 483–510; but this article is insufficient from a mathematical-astronomic point of view.

[2] See Maimonides, *Le Guide des égarés*, ed. and tr. S. Munk, Paris, 1856–66, ii. 185 f.

[3] *Comm. de Cœlo*, ii. 35 (*Aristotelis Opera omnia cum Averrois Cordubensis commentariis*, Venice, 1562, v. fol. 118v.–119r.).

[4] Ed. cit. viii. fol. 331v.–332r.

[5] Thus the Latin translator in the commentary on the *Metaphysic* renders the Arabic adjective *laulabī* 'spiral, in the form of a spiral or of a screw.'

[6] And, in fact, this was the hypothesis of Eudoxus.

[7] *I.e.* the motion of the libration of the fixed stars in the hypothesis of the Spaniard az-Zarqālī (see above, § 5, (*c*)).

[8] Cf. also ed. cit. viii. fol. 329v. (on *Metaphys.* xii. 45).

be a lemniscate described on a spherical superficies instead of on a plane. There naturally occur in the hypothesis of Eudoxus some special conditions, of which Averroës does not seem to have thought; one does not understand, then, how the Arabian philosopher thought to save himself from the greatest objection which could be made to the system of concentric spheres, viz. that by making the distance of the celestial bodies from the earth always equal it did not permit of an explanation of the variation of the diameters of the sun and moon.

Another friend and disciple of Ibn Ṭufail, al-Biṭrūjī (a native of Pedroche to the north of Cordova),[1] attempted a complete system as a substitute for the geometrical hypothesis of Ptolemy,[2] by placing the data of observation of the *Almagest* in agreement with the peripatetic philosophy. He says that, moved by discourses of Ibn Ṭufail to meditate on this question, he had arrived at new theories by a kind of divine revelation. He admits with Ptolemy the nine spheres concentric with the earth; on the other hand, he denies the eccentrics and the epicycles. He finds it to be contrary to natural order that, while the ninth sphere impresses on all the others the diurnal motion of rotation from east to west, the spheres below the ninth should have besides a motion of their own in an opposite direction. In order to remove this contradiction, he conceives a whimsical theory which betrays the inexperience of the author in the field of practical astronomy.

According to him, the movements of the planets and of the fixed stars in longitude take place in reality from east to west, like the diurnal motion of the rotation of the heavens; those movements which astronomers have judged to be from west to east are simply illusory appearances due to the progressive diminution of the angular velocity of the spheres, according as a gradual approach is made from the ninth sphere to the earth.[3] The ninth sphere accomplishes the 360° of circumference in 24 hours and communicates this motion to the spheres below; but the impulse grows weaker from sphere to sphere. That of the fixed stars, which is immediately under the ninth, accomplishes in 24 hours something less than 360°; and this little retardation brings it about that after 36,000 years[4] it has accomplished a whole circuit less than the ninth sphere and appears to be moving very slowly in a direction contrary to it. Under the sphere of the fixed stars comes that of Saturn, considerably slower; it accomplishes in the space of about 30 years[5] a whole circuit less than the ninth sphere. Thus Jupiter loses a whole circuit in 12 years; Mars in two; Venus, the sun, and Mercury in one; and the moon in a little more than 27 days. This, then, is the reason why all the spheres under the ninth appear to move in a direction contrary to it.

For physical reasons, therefore, al-Biṭrūjī believes that the sphere of Venus is to be placed above the sun and that of Mercury below it. There remain to be explained the inequalities of the motions of the sun, moon, and planets. He says that he drew inspiration for this from constructions analogous to that by which az-Zarqālī had imagined the motion of the libration of the fixed stars. While az-Zarqālī made the poles of the ecliptic rotate parallel with the plane of the equator, al-Biṭrūjī, in the case of the planets, made the poles of the planetary spheres move on inclined planes round the poles of the equator or of the ecliptic; from this it results that the planets describe lines *laulabinæ*, *i.e.* spiral, on a spherical superficies. Thus are also explained the stations and retrogradations of the planets. For this part, therefore, we have the partial resuscitation of the hypothesis of Eudoxus. The ideas of al-Biṭrūjī were accepted by a fair number of Christians and Jews in Spain and Provence; and they had also an echo in Italy in the 16th century.

7. Celestial physics.—As is said above,[6] celestial physics, according to Muhammadan and Greek writers, lies outside the field of astronomy; its problems are discussed in books of metaphysics, of physics in an Aristotelian sense, and of theology, or at least in special works, of which the greater part are now either lost or unedited.

Like Ptolemy, the most ancient Arabic astronomers neglect to define the idea of the celestial spheres and limit themselves to considering them in the mathematical aspect of ideal circles representing the movements of the heavenly bodies.

[1] Alpetragius of our mediæval writers.

[2] Of the book of al-Biṭrūjī there has been published only an obscure Latin tr. (Venice, 1531) made from a Hebrew version. The Latin tr. made in 1217 at Toledo by Michael Scotus is unedited, as is also the Arabic text.

[3] This idea was already maintained by the Iḫwān aṣ-Ṣafā' about the middle of the 10th cent. (see their *Rasā'il*, Bombay, 1305–06 A.H., ii. 22–26) and by Faḫr ad-dīn ar-Rāzī, *Mafātīḥ al-ghaib*, Cairo, 1308 A.H., ii. 60 *f.* (comm. on *Qur.* ii. 159) and vi. 117 *f.* (on *Qur.* xxi. 34). But they admit Ptolemy's eccentrics and epicycles.

[4] This is the period of time in which, according to Ptolemy, the fixed stars accomplish the circumference, proceeding towards the east.

[5] The duration of the heliocentric sidereal revolution of Saturn is a little less than 29½ years; it is, in the Ptolemaic hypothesis, the revolution of the centre of the epicycle of Saturn in the zodiac.

[6] See § x.

The Aristotelian conception of solid spheres was introduced for the first time[1] into a purely astronomical treatise by Ibn al-Haitham; and he, in his unedited compendium of astronomy, gives the definition which was accepted afterwards by all the other writers of elementary treatises: 'A celestial sphere (*falak*, plur. *aflāk*) is a body completely spherical, bounded by two parallel spherical superficies having the same centre.'[2] In this, as he himself says, he drew his inspiration from the *Hypotheses Planetarum* of Ptolemy; in fact, as we see from a passage of Naṣīr ad-dīn aṭ-Ṭūsī, he followed the *Hypotheses* also in expounding how the celestial motions can be represented, and also by supposing simple equatorial zones of those complete spheres, so that the spheres of the epicycles become, as it were, tambourines (*duff*) rotating on their own axes, and the other spheres like armils.[3] This second form of representation was soon abandoned, as contrary to the principles of natural philosophy.

Muhammadan writers agree with Aristotle in holding that the spheres and the celestial bodies are a simple unique substance, different from the four elements of the sublunar world, and forming a fifth element. The solidity also of the spheres, by reason of which the stars remain infixed within them, and by which the stars are carried round, is accepted by almost all,[4] except a few theologians who, to support a strictly literal meaning of a passage of the Qur'ān,[5] maintain that the stars move within the spheres like fish swimming in water. The ideas of the majority of writers after the 4th cent. of the Hijra are those set forth in the dogmatic theology of al-Baiḍāwī († 1286) as follows:

'The spheres are transparent; since if they were coloured, our eyes could not possibly see that which is within them. They are neither hot nor cold; since otherwise the heat and cold would dominate in the elements of the sublunar world on account of their contiguity to it. They are neither light nor heavy; since otherwise in their nature there would be a tendency to rectilinear motion.[6] They are neither moist nor dry; otherwise the facility or difficulty of taking certain forms or of attaching themselves would be manifested in rectilinear motion. They are not capable of quantitative motion; since, if the convexity of the external superficies were to increase, it would be necessary that there should be a void above it, which is absurd; and the same is to be said regarding concavity since if this were to increase it would be necessary that one sphere should enter into another or that between the two there should be a void.'[7]

So also it is proved by Aristotelian reasonings that the motion of the spheres must be circular.

The greater number of Muhammadan philosophers accept the peripatetic doctrine that the spheres and the stars are living beings, rational, operating by their own will; that the spheres have souls which exist in their bodies as our souls in our bodies; and that, as our bodies move under the impulse of our souls towards the ends we have in view, so also do the spheres, which have as their end the serving of God. This doctrine is for the most part repudiated by the theologians: al-Ghazālī († 1111) does not deny the possibility of it, but he affirms that we are incapable of knowing it; on the other hand, Ibn Ḥazm († 1064), Ibn Qayyim

[1] This follows from the preface itself of Ibn al-Haitham and from the attestation of Muḥammad al-Akfānī as-Saḫāwī, *Irshād al-qāṣid*, p. 85.

[2] Only the spheres of the epicycles are full, *i.e.* are true globes.

[3] These two forms of hypothesis are always found side by side for every planet, in bk. ii. of the *Hypotheses*, published for the first time (1907) in German according to the Arabic version which takes the place of the lost Greek text (in Ptolemy, *Opera astronomica minora*, ed. Heiberg, p. 113 ff.).

[4] The ancient Arab astronomers—*e.g.*, al-Battānī (i. 124)—leave the question uncertain.

[5] xxi. 34.

[6] According to the Aristotelian theory (*de Cœlo*, i. 3 f.), heavy bodies tend in a straight line towards the centre of the world, light bodies tend to withdraw in a straight line from the centre.

[7] *Maṭāliʿ al-anwār*, Constantinople, 1305 A.H., p. 262.

al-Jauziyyah († 1350), and many others absolutely deny life and intelligence to the heavenly bodies. The philosophers of the peripatetic school and several theologians (*e.g.*, al-Baiḍāwī) hold that the movers of the celestial souls and consequently of the spheres are pure intelligences. Concerning their origin al-Fārābī, Avicenna, and their followers maintain a Neo-Platonic emanatory theory: from the first principle emanates the first intelligence, and from this are derived all the nine spheres by means of successive triads always composed of intelligence, soul, and body, until one arrives at the final or active intelligence from which is derived all the material of the sublunar world. This theory is vigorously opposed by al-Ghazālī and the other theologians.

The question of the marks on the moon is either neglected or only hinted at in the works hitherto published. The idea that the moon had valleys and mountains like the earth—an idea set forth by several Syriac writers—did not harmonize with the Aristotelian conception of the nature of the heavenly bodies and so could not be accepted by Muhammadan writers.

Observation of the solar spots is almost impossible to the naked eye; Faḫr ad-dīn ar-Rāzī, however, explicitly affirms: 'There are those who believe that there exist on the surface of the sun spots, in the same manner as there are marks on the surface of the moon.'[1] These spots were actually seen on some occasions, but were erroneously believed to be transits of Mercury and Venus across the sun.

The comets and the other meteors (in an Aristotelian sense) were the subjects of observations and of numerous monographs. But, judging from the little that we know about them, Muhammadan writers followed in this matter the theories set forth by Aristotle in his books on meteorology.[2]

8. Conclusion.—The importance of Muhammadan astronomy in the history of science has been variously judged; sometimes Muhammadan astronomers have received excessive praise, sometimes unjust criticism, as if they had done nothing but preserve and transmit to Europe Greek science, improving it only in minor details. This harsh verdict is due not only to very imperfect knowledge of the Arabic writings on astronomy (of which the greater part is still unedited), but also to the fact that no account has been taken of the special conditions of astronomy in the glorious period of Muhammadan culture. The system invented by the Greek geometricians, and completed by Ptolemy, for representing all the celestial motions had mathematically all the precision that could be desired or attained by the use of the best instruments; it produced no sensible discrepancy between theory and the result of observation. The elliptic orbits of Kepler would not have given the theory greater perfection than it received from the complicated system of eccentrics and epicycles; the latter indeed had the advantage of preserving the Pythagorean and Aristotelian principle, which denied any but circular movement in the heavens. One must not forget that even in the heliocentric system of Copernicus the motions of the planets were still explained by means of combinations of epicycles — combinations which were in several cases less perfect than those employed by the Ptolemaic astronomy. To change the method of geometrical representation would therefore have been whimsical—a mathematical trick, which no datum of observation would have justified; and, in fact, those Arabs who wished to eliminate the eccentrics and the epicycles[1] were philosophers rather than astronomers, and they propounded their hypotheses from data based only on Aristotelian physics.

It is thus easy to understand how it was that, *e.g.*, the astronomers of the khalīf al-Ma'mūn and their successors saw no necessity for drawing from their observations of the movement of Venus[2] the final conclusion that Venus revolved round the sun. From the point of view of such phenomena as could be observed without telescopes, this second hypothesis had no higher value than that which made Venus revolve round the earth. In a word, celestial appearances gave no cause to shake the foundations of the geocentric system, which agreed very well with every religious notion, and which was supported by the authority of both Aristotle and Ptolemy, reinforced by a very potent element in Hellenistic and mediæval culture, viz. astrology. Giovanni Schiaparelli, in one of his monographs on Greek astronomy,[3] has set forth clearly the decisive influence which astrology, brought into Greece by the Chaldæan Berosus (3rd cent. B.C.) and consequently received with great favour by the Stoics and Neo-Pythagoreans, had in the abandonment of the heliocentric system of Aristarchus. Astrological doctrine, based on the immobility of the earth in the centre of the world, was irreconcilable with any system which made the earth revolve round the sun or round any other body; astrology was thus a very powerful additional obstacle to the abandonment of the geocentric idea. Further, we must not forget that it was only in the 17th cent. that European physics reached clear proofs of the diurnal rotation of the earth and justified elliptic orbits and the heliocentric system, and that the really irrefutable argument for the revolution of the earth round the sun was furnished only in 1728 by the discovery of the aberration of the fixed stars.

An essential condition of all astronomical progress is to have at disposal a long series of methodical observations; and in this matter Muhammadan astronomers were obliged to begin, so to say, from the foundation. Ptolemy was the last Greek observer; but not even all the observations which he says he made are true. In several cases of capital importance—*e.g.*, regarding the obliquity of the ecliptic and the longitude of the solar apogee —he gave as agreeing with his own observations data found about 270 years before his time by Hipparchus, thus causing certain elements to be believed constant which are really variable. In other cases—*e.g.*, regarding the precession of the equinoxes — his observations are very rough. Theon of Alexandria (4th cent. A.D.) and Proclus (5th cent.) do no more than accept Ptolemy's elements, in some ways aggravating his errors; accordingly, during the seven centuries from Ptolemy to the first flourishing of Arabo-Muhammadan astronomy, we have not even one observation which is of use to the science. The first task, therefore, of the Arabic astronomers was to revise all the Ptolemaic elements of the celestial motions; it was a time not to form new theories but to collect the indispensable elements of fact by means of continuous observations more accurate than those of the Greeks. This task was accomplished by the Muhammadan astronomers in a marvellous manner;

[1] *Mafātīḥ al-ghaib*, i. 259, on *Qur.* ii. 27.

[2] On falling stars see present writer's art. in *Rivista degli Studi Orientali*, viii. [1920] 375–388.

[1] See above, § 6.

[2] They found (contrary to Ptolemy) that Venus has the same longitude of apogee, the same eccentricity, and the same equation of centre as the sun; and so the true longitude of the centre of the epicycle of Venus is always equal to the true longitude of the sun. This was the same as to suppose that the orbit of Venus is an epicycle whose centre is always the true place of the sun and runs over the solar orbit; in other words, it was equivalent to making Venus a satellite of the sun.

[3] *Origine del sistema planetario eliocentrico presso i Greci*, Milan, 1898, § 55.

indeed, we must come down to the time of Tycho Brahe (1546–1601) to find observers and observations comparable to those of the Muhammadan Middle Ages. Further, by founding trigonometry in a modern sense and developing it to a high degree they furnished astronomical science with an excellent instrument for its work.

The influence of Muhammadan astronomy in Europe is so far-reaching that to treat of it at length would be to give the history of some centuries of European astronomy. From the 12th cent. to the end of the 15th the compendiums used in the schools were translated from Arabic or were based on Arabic writings; the astronomical tables and the processes of calculation were derived from Arabic works, among which must be classed (from the point of view not of their language but of their contents) the celebrated tables of Alfonso which were still used by many in the 16th century. Spherical trigonometry in Europe started from Arabic treatises; the famous Regiomontanus himself (1436–76) borrows more than appears on the surface from al-Battānī. Through the influence of these Arabic sources the ancient Latin technical terminology was greatly modified, and not only do Arabic astronomical terms enter into European languages, but Latin words acquire new significations by imitation of corresponding Arabic words. The words 'degree,' 'minute,' 'equation' (in its astronomical sense), 'equation of the centre,' 'argument' (of a table), and some others, owe their technical signification to ridiculously literal translations of Arabic writings. We cannot enumerate all that European astronomy owes to Muhammadan observers; it will be enough to recall that they rendered inestimable services even to writers of the 17th cent.—*e.g.*, Halley—precisely because they offered the only certain means of checking elements determinable only by a comparison with observations separated by long intervals of time. The books of Regiomontanus, Purbachius, Copernicus, Tycho Brahe, Riccioli, etc., cite the observations which were known to them of their Oriental predecessors. The theory and practice of instruments in Europe has also Arabic sources. Finally, we must not forget the influence exercised by the Arabs in the way of example. They infused into the Christians and Jews of Spain a passion for continued observations and an idea of the perfectibility of astronomical science; from Spain this passion and idea spread through the rest of Europe, preparing the way for modern astronomy.

The conditions of the Byzantine mediæval world were not favourable to the development of the sciences. Nevertheless, Muhammadan culture, which left many traces in Byzantine astrology, had also its part in astronomical studies. In 1323 an anonymous Greek introduced the Persian astronomical tables of Shams ad-dīn al-Buḫārī (Σὰμψ Μπουχαρής), which were at once widely used; in 1346 George Chrysococces made a new redaction of them, preserving at the same time many Arabic-Persian technical terms; and finally, about 1361, Theodore Meliteniotes reproduced these methods and these Persian tables in the third and last book of his Ἀστρονομικὴ Τρίβιβλος, after having set forth in the first and second books the methods and the tables according to Ptolemy and Theon of Alexandria. Thus there was created at Byzantium also a new astronomical terminology different from that of the classic Greek; and sometimes even Greek proper names appeared transformed by their passage through Arabic-Persian sources, as Θαούνης in place of Θέων.

LITERATURE.—There is no satisfactory exposition of the astronomy of the Muhammadan peoples in the Middle Ages; the general histories of astronomy—*e.g.*, those of F. Hoefer, J. H. von Mädler, R. Wolf (the best of all), and Arthur Berry—are inadequate, antiquated, and often erroneous. J. B. J. Delambre, *Hist. de l'astronomie du moyen âge*, Paris, 1819, pp. 1–211, and 513–539, is not a history but an analysis (of very unequal value) of various works of Muhammadan authors; the part devoted to the unedited book of Ibn Yūnus (pp. 76–156) is especially noteworthy, but it has the usual defect of Delambre—instead of the analyzed processes of the author, it substitutes a series of formulæ found by Delambre himself. Useful, but to be used with great caution, is L. A. Sédillot, *Matériaux pour servir à l'hist. comparée des sciences mathématiques chez les Grecs et les Orientaux*, 2 vols., Paris, 1845–49; see also his *Mémoire sur les instruments astronomiques des Arabes*, do. 1841 (*MAIBL, Savants étrangers*, i.). The present writer's Arabic book quoted above, p. 90ª, n. 1, concerns only the earliest period (summary of H. Suter, in *Bibliotheca Mathematica*, III. xii. [1912] 277–282). Many historical notices concerning the development of astronomical theories are to be found in the present writer's commentary on al-Battānī, *Opus astronomicum*, 3 vols., Milan, 1899–1907; short notices are to be found here and there in E. Wiedemann, 'Beiträge zur Geschichte der Naturwissenschaften,' nos. iii.–xxxviii. (in the *Sitzungsberichte der physikal.-medizinischen Sozietät in Erlangen*, 1904–1914) and in other small pamphlets by the same author. For biographical and bibliographical notices concerning individual writers see the excellent book of H. Suter, *Die Mathematiker und Astronomen der Araber und ihre Werke*, Leipzig, 1900, and 'Nachträge und Berichtigungen zu Die Math. und Astron.,' in *Abhandl. zur Gesch. der mathemat. Wissenschaften*, xiv. [1902] 157–185. For edd. and tr. of original texts see above, II. a.

CARLO ALFONSO NALLINO.

SUN, MOON, AND STARS (Teutonic and Balto-Slavic). — I. *TEUTONIC.*—**1. Archæological evidence.**—The world-wide symbol of the sun-wheel occurs in the earliest Scandinavian rock-markings. Rude representations of horses and ships, which may have solar significance, are also found. In 1902 a curious object, apparently connected with the sun-cult, was discovered near Trundholm in Sweden. It is a representation of a disk, having gilding on one side and spiral ornamentation on the other, with a horse in front of it, both horse and disk being drawn on a waggon.

2. Solar myths.—Sun and moon, day and night, summer and winter, are personified in the poems of the older Edda. The Valkyrie Sigrdrifa invokes Day and the sons of Day, Night and her kinswoman.[1] Various passages from *Grimnismál*, *Vafþrúðnismál*, and *Völuspá* are summarized by Snorri:[2]

'Night, who was of Jotun race, married Delling, who was of Aesir race, and their son was named Day.' 'Then Allfather took Night and her son Day and set them up in heaven and gave them two steeds and two chariots and they were to drive round the earth every twenty-four hours.' The earth is bedewed by the foam which falls each morning from the bit of Hrimfaxi, the horse of Night. Day's steed is called Skinfaxi and he lights up the whole world with his mane. 'Then said Gangleri: "Who steers the course of the sun and of the moon?"' Mundilföri had a son Mani and a daughter Sol, whom the gods set up in heaven. 'They let Sol drive the steeds which drew the chariot of that sun which the gods made to light the world, from the sparks which flew out of Muspellheim [*i.e.* the world of fire and heat]. . . . These steeds are called All-Swift and Early-Awake, but under the withers of the horses, the gods set two wind-bellows to cool them, but in some old records that is called "isarnkol" [*i.e.* iron-coolness]. Mani steers the course of the Moon and rules over waxing and waning.'

The belief in the chariot and horses of the sun is very wide-spread; in Scandinavia, judging by the archæological evidence, it must have existed in very early times. We may have a reference to the same idea in Tacitus:

'Beyond the Suiones is another sea, sluggish and almost stagnant, by which the whole globe is imagined to be girt about and enclosed, from this circumstance that the last light of the setting sun continues so vivid till its rising as to obscure the stars. Popular belief adds, that the sound of his emerging from the ocean is also heard, and the forms of horses and the rays streaming from his head are beheld.'[3]

Like most other primitive people, the Scandinavians were struck by the phenomena of the eclipses, which they thought were caused by wolves.

'He who pursues her [*i.e.* the sun] is called Skoll; he frightens her and he will catch her; but he who is called Hati

[1] *Sigrdrífumál*, 2. [2] *Gylfaginning*, x.–xii.
[3] *Germ.* 45. Unfortunately the text is uncertain; some editors read *deorum* for *equorum* in the last sentence.

Hroðvitnison leaps in front of her, and he will catch the moon, and so it must be.'[1] 'Skoll is the name of the wolf, who pursues the gleaming goddess to Ironwood. Another called Hati, son of Hroðvitni, goes before the fair bride of heaven.'[2]

Sun and moon will be involved in the final world-catastrophe.

'Then said Gangleri: "Of what race are these wolves [*i.e.* Skoll and Hati]?" Hár said: . . . "The old giantess rears the sons of many Jotuns and all in the form of wolves, and it is said that of the race of these wolves, there shall come one mightier than all, called Moon-Swallower and he . . . in demon's form shall seize the moon. . . . He shall fill himself with the bodies of doomed men, he shall stain the god's abode with red blood; the sunshine shall be black, and all the weather treacherous during the following summer."'[3]

'Whence comes a sun, in the smooth sky,
When Fenrir [*i.e.* a monstrous wolf] has overtaken this one,
One daughter alone, shall the Elf-beam [*i.e.* the sun] bear,
Before Fenrir overtakes her.
The maiden shall ride on the mother's paths
After the Powers have perished.'[4]

3. Sun-worship.—Our knowledge of the religious practices of the Teutons is very meagre, and it is difficult to say how far the stories told in the two Eddas formed part of a living religion, even among the Scandinavians. We have, however, various references to the sun-cult from other sources. Procopius[5] describes how in the island of Thule [*i.e.* Scandinavia] the sun does not appear for 40 days at the winter solstice. At the end of this period messengers are sent up into the mountains to watch for the rising sun. They send word to the people below that the sun will shine upon them in five days: thereupon begins 'the greatest feast of the inhabitants of Thule.'

The positive side of Cæsar's well-known description of Teutonic religion[6] is probably true. The Teutons may well have acknowledged as gods such things as are 'objects of sight and by whose power they are apparently benefited, the sun, moon, fire,' although these were not their only deities. Observances in connexion with the sun and moon are forbidden in Christian sermons and penitentiaries. St. Eligius (588–659) tells his hearers that no Christian person 'calls sun or moon lords.' In the 11th cent. the *Decrees* of Burchard of Worms mention pagan traditions:

'Id est ut elementa coleres, id est lunam aut solem, aut stellarum cursum, novam lunam, aut defectum lunae, ut tuis clamoribus aut auxilio splendorem ejus restaurere valeres.'[6]

From Canute's Anglo-Saxon Laws[7] we learn that 'heathenship is to honour heathen gods, and sun or moon, . . . etc.' We have perhaps a trace of sun-worship in *Landnámabók*:

'Thorkell Moon, the law speaker, was of the best conversation of any heathen man in Iceland. . . . He had himself carried out into the rays of the sun in his death-sickness and commended himself to that god which had made the sun.'[8]

We know little of Anglo-Saxon paganism. Bede, however, mentions a goddess Eostur, in whose honour April was called 'Eosturmonath.'[9] The word 'Eostur' is identical with the Latin, Greek, Sanskrit, and Lithuanian names for the goddess of the dawn, or *Morgenröthe*, probably the same being who is referred to in the Lithuanian and Lettish folk-songs as the daughter of the sun.

Throughout Teutonic territory the first and second days of the week are named after the sun and moon. Sunna is mentioned with Wodan and Frûa in the Merseberg charm. Sol is counted as one of the *asynjur*.[10]

It is noteworthy that Snorri (see above) distinguishes between the physical sun and moon and the beings who rule over them and guide their movements. This distinction has been partly preserved in the Old Norse language, where the word *tungl* (A.S. *tungol*, Goth. *tuggls*, 'a star') denotes the actual moon, and Máni the supernatural being who directs his course. The same idea seems to underlie many of the Lithuanian and Lettish folk-songs.

II. *LETTISH, LITHUANIAN, AND OLD PRUSSIAN.*—**1. Mythology.**—Our chief knowledge of the solar mythology of the Baltic peoples is derived from Lettish and Lithuanian folk-songs, the most significant of which have been translated and analyzed by W. Mannhardt.[1] In these poems the changes which pass over the face of the sky, especially at dawn and sunset, are viewed as a drama, the chief actors being sun, moon, the daughter of the sun, the sons of God, Perkun, the thunder deity, 'God' and 'dear Maria'—the last two being as frankly pagan as the rest. Often, of course, the poems are confused and inconsistent, and it must be remembered that the terms 'sun,' 'moon,' etc., sometimes stand for the presiding deity, sometimes for the actual sun, etc., personified:

'The Sun, in the apple garden,
Weeps bitterly.
The *golden apple* hath fallen
From the apple tree.'[2]

(Here there is a clear distinction between the deity and the physical sun.)

'The Sun dances over the silver mountain,
Silver shoes she hath on her feet.'[3]

(In this case sun and sun-goddess appear to be one and the same.)

'God,' who was at war with the sun for three nights and three days, is evidently a sky-deity. The sky itself is described as a 'great water' or a mountain:

'The Sun with two gold horses
Rides up the rocky mountain,
Never heated, never weary,
Never resting on the way.'

(In this and in other songs we get the wide-spread myth of the horses of the sun.)

2. The sun.—The sun is called in many of the songs 'daughter of God,' in Lettish sources *saules-maat*, 'mother of the sun.' She is married to the moon, who is, however, an unfaithful husband.

'It happened in the spring-time
That sun and moon did wed,
But the sun rose up early
And from her the moon fled.
The morning star was loved then
By the lone wandering moon,
Who with a sword was smitten
In deep wrath by Perkun.'[4]

The children of the sun and moon are the stars, who are called orphans, because they appear only at night after their mother, the sun, has abandoned them.

3. The sons of God.—The morning and the evening stars play an important part in the folk-songs, sometimes as a single being, sometimes in dual form. In Lithuanian sources they are called Auszrine and Wakarine[5] and are described as the handmaids of the sun.

'"Dear sun, daughter of God,
Who kindles your fire in the morning?
Who spreads your bed in the evening?" . . .
"Auszrine kindles the fire.
Wakarine spreads the bed."'[6]

In Lettish songs the morning and the evening stars are called the 'sons of God'—an epithet exactly equivalent to the Greek Dioskouroi. Like the Dioskouroi and the Aśvins of Indian mythology, the Lettish sons of God are connected with horses:

'Hither rode the dear sons of God
With steeds dripping with sweat.'[7]
'Folks say the moon has no steeds of his own.
The morning star and the evening star
They are the steeds of the moon.'[8]

4. The daughter of the sun.—A favourite theme of the Lettish folk-songs is the wooing of the daughter of the sun by the son of God, the sun providing the dowry, often most unwillingly.

'Why are grey steeds standing
By the house-door of the sun?
They are the grey steeds of the son of God
Who woos the daughter of the sun.
The son of God stretches out his hand
Over the great water
To the daughter of the sun.
The sun cries bitterly
Standing on the mountain.
Why should she not weep?
She sorrows for the little maiden,
She sorrows for the dowry,
For the chest which is laden
With gold and silver gifts.'[1]

This is a good example of a sunrise or sunset myth. The daughter of the sun is the red glow which is in the sky when the planet Venus appears, but soon afterwards melts into darkness or the full light of day. The 'dowry' seems to be the rays of the sun which light up the edges of the clouds and the tops of trees and mountains.

'The sun prepareth the dowry herself, gilding the edge of the forest of pines.'[2]

The daughter of the sun is almost certainly identical with the goddess mentioned by Lasicius.[3] 'Ausca dea est radiorum solis, vel occumbentis vel supra horizontem ascendentis.'[4]

5. Dear Maria.—Mannhardt considers that the name Maria has been substituted for that of various pagan deities, but it is also possible that she stands for a particular goddess, perhaps the Perkuna tete (*i.e.* the aunt of Perkun) mentioned by Lasicius: 'Perkuna tete is the mother of thunder and lightning; who receives into a bath the weary and dusty sun, and sends her out again next day washed and shining.'[5] Maria also presides over a bath-chamber:

'Behind the mountains smoke is rising.
Who is it hath kindled fire?
Dear Maria heats the bathroom
Where bathe little orphan maidens [*i.e.* stars].'[6]
I ran down into the valley, into the bath-chamber of dear Maria.'[7]

According to Prætorius,[8] the Nadravians worshipped a star-god Szweigsdukks, who is evidently the Suaixtix worshipped by the Sudavians in Samland and equated with Sol in the *Constit. Synod. Evangel.* of 1530. Lucas David[9] calls Suaixtix the god of light and mentions him as one of the four deities who were invoked at agricultural festivals.[10] This deity seems to have been worshipped in both male and female form: 'They more commonly called this godhead Sweigsdunka, a star-goddess, whom they consider the bride of the sky and through whose power the morning and evening stars are guided.'[11] Is this perhaps 'the maiden who weaves star-coverings,' mentioned in one of the folk-songs, and also the goddess whose place has been taken by dear Maria, and who was also known as the aunt of the thunder-god? The underlying idea may be that she is a goddess of fire, light, and heat.[12]

6. Cult.—We know little of the sun-cult of the Baltic peoples, although we know from Peter von Dusburg[13] and Erasmus Stella[14] that sun, moon, and stars were worshipped as important deities.

Prætorius[1] tells us that Bretkius (a historian of the 16th cent.) had observed that the Nadravians did honour to their gods by worshipping the different phases of the moon at various stages of their agricultural work.

In the course of his missionary journeys among the Lithuanians Jerome of Prague met with a people who worshipped the sun and who had a strange cult of a huge iron hammer. The priests justified this cult by telling Jerome that formerly the sun had been invisible for many months because a king had imprisoned it in a tower. 'The signs of the zodiac brought help to the sun, and broke the tower with the huge hammer, and restored the liberated sun to men, and therefore that which had been the instrument by which mortals had received light was worthy of veneration.'[2] According to Rendel Harris, the signs of the zodiac here stand for the Heavenly Twins or 'Sons of God': 'These and similar cases all arise out of the same theme, that the Sun (or the daughter of the Sun) has been carried off, or swallowed or imprisoned, and must be recovered.'[3] They use the hammer, the weapon of the thunder-god, because sacred twins are universally considered as children of the sky or thunder-god. In one of the Lettish songs they are described as 'workmen of Perkun.'

SUN-DANCE.—See PHALLISM, ix. 823.

SUNDAY.—1. History of Sunday before the Christian era.—Only three times in the NT is there any reference to a religious observance of Sunday. St. Paul urged his converts at Corinth to put aside money for charity every Sunday (1 Co 16^2). Shortly after writing this he preached at a service held at Troas, which is mentioned as if it were a regular institution (Ac 20^7). Thirty years later, perhaps, the author of the Apocalypse wrote: 'I was in the Spirit on the Lord's day' (Rev 1^{10}). Though not quite conclusive, the evidence makes it probable that the observance of Sunday began among St. Paul's churches, which were predominantly Gentile. Now we cannot suppose that Gentile Christians, who were taught by St. Paul to protest against having the Sabbath imposed upon them, would yet accept from the Jews a whole system of reckoning time by weeks. It is important, therefore, to inquire how far the week was recognized in the Græco-Roman world independently of the Jews.

The week originated in Babylon, where it was invented for astrological reasons, but came to be used as a civil division of time. At first each month began with a fresh week, so that there were two or three odd days at the end. This was too inconvenient to last; and the weeks, emancipated from the month, ran on in an unbroken series. The gradual diffusion of Babylonian astrology carried a knowledge of the week into W. Asia, then into Egypt, and later still into E. Europe. The Israelites, when they invaded Canaan, found it established there and adopted it, as they did many other elements of Amorite culture; but the emphasis laid upon the Sabbath was their own.

In considering the recognition of the week in Europe it will be convenient to trace the evidence backwards. We may begin with Dio Cassius. Writing soon after A.D. 230, he says:

'The dedication of the days to the seven planets originated in Egypt, but has spread over all the world in comparatively

[1] *Deliciæ Prussicæ*, p. 18. [2] Æneas Sylvius in *ib.* iv. 239.
[3] *Boanerges*, p. 334.

recent times. The ancient Greeks, at any rate, knew nothing of it: but now it is established not only among all other peoples but even among the Romans, who already regard it as more or less a national tradition.'[1]

In the middle of the 2nd cent. Justin Martyr, writing for heathen readers, speaks of Saturday and Sunday (*τὴν Κρονικήν, τὴν Ἡλίου ἡμέραν*) as if they were familiar names to all.[2] Near the end of the 1st cent. Josephus boasts:

'Nor is there any city of the Greeks, nor any barbarian city, nor any nation, where our custom of resting on the seventh day has not reached.'[3]

That, no doubt, is an exaggeration; but it would have been meaningless unless division of time into weeks had been so familiar that any one might know which day was a Saturday. The belief that such was the case in the 1st cent. is supported by a picture which was found at Herculaneum, and therefore painted before A.D. 79. It contains the heads of the seven planetary deities in the order of their days—Saturn, Apollo, Diana, Mars, Mercury, Jupiter, Venus. Numerous references in Latin literature assure us that the Jewish Sabbath was well known as early as the Christian era. But only those are to our purpose which imply familiarity with the week. Such are the passages in Tibullus,[4] Ovid,[5] and Martial,[6] which mention the observance of Sabbaths by Romans. But more remarkable is the fact that Horace,[7] writing about 35 B.C., could represent an ordinary superstitious mother as making a vow for next Thursday (*Jovis dies*) and could describe how he himself attempted to escape from a bore by pleading that it was a special Saturday.[8] Neither the vow nor the plea would be intelligible without the week as a familiar background.

2. Sunday in the primitive Church.—It was therefore not only the Jewish proselytes among St. Paul's converts, but all his Greek and Roman disciples, who reckoned their time by weeks and therefore found a weekly day of worship natural. To such, again, as were Jews by race it seemed actually part of the order of nature. That is why, we may well suppose, St. Paul's protests against the observance of the Sabbath or of any fixed days[9] were but partially successful. The Sabbath, indeed, was given up by the churches which he founded. But, as a concession to his converts' habit of mind, another day of the week was chosen for worship. There could be no question what the choice should be, for the Lord's resurrection had given the first day of the week an unquestionable pre-eminence.

The name of this day which was current in the Roman Empire was 'the day of the sun' (*ἡ Ἡλίου ἡμέρα, dies solis*). The Jews, who avoided all use of heathen terms for either days or months, called it the first day of the week (*μία Σαββάτων*), and the earliest Christians followed their example. But a mere number was felt to lack distinction, and very soon an appropriate name was found, which contrasted alike with Sabbath and Sunday. The first day of the month, at least in Asia Minor, was usually called the 'Emperor's Day' (*Σεβαστή*).[10] Now the early Christians, partly by way of challenge, applied to their Lord many of the official terms which were consecrated to the emperor, the lord of the earth. So it was probably not without reference to the term *Σεβαστή* that they entitled the first day of the week *Κυριακή*, 'the Lord's Day.' So apt a name was rapidly established. The author of the Apocalypse, writing about A.D. 90, uses it without explanation. To Ignatius[11] (*c.* A.D. 110) it was a matter of course and a basis for argument. When the empire became Christian, the name entirely displaced 'the day of the sun' for all who spoke Greek or Latin. *Κυριακή* remains to this day in Greek; and in the Romance languages we find derivatives of *dies Dominica* — Dimanche, Domenica, and so on. But the Northern peoples, who in accepting the week from the heathen Romans had named the days after the corresponding Northern divinities, were more conservative. In England Sunday (A.S. *Sunnan Daeg*), in Germany *Sonntag*, in Sweden *Söndag*, have resisted all attempts to substitute either Lord's Day or Sabbath.

3. Observance in the Church before A.D. 321.—The records tell us very little about the manner in which Sunday was observed during the first three centuries, except that it was the day on which Christians assembled for worship. After St. Paul, who is quoted above, our first witness is the younger Pliny. His famous letter, written to the emperor Trajan in A.D. 104, tells how the Christians in his province of Bithynia held a service early in the morning 'on a fixed day' (*stato die*) and a common meal late in the evening.[1] Ignatius (A.D. 110) insists upon the contrast between the Lord's Day and the Sabbath.[2] A little later the *Teaching of the Apostles* ordains:

Κατὰ κυριακὴν δὲ Κυρίου συναχθέντες κλάσατε ἄρτον καὶ εὐχαριστήσατε προεξομολογησάμενοι τὰ παραπτώματα ὑμῶν, ὅπως καθαρὰ ἡ θυσία ὑμῶν ᾖ.[3]

A simple service, before or after the day's work, was the only observance possible for a community most of whose members occupied very humble stations, while many were slaves. As the Christians advanced in numbers and in social position, they were able to command the time for a long service. Justin Martyr, writing about A.D. 170, describes one which must have occupied at least two hours; for it includes readings from the Bible, sermon, prayers, and Eucharist.[4] And, since Melito, bishop of Sardis, just about the same time published a treatise *On the Lord's Day*, we may conclude that the services were being systematized.[5] How important they were considered is partly shown by Tertullian's attack upon cowardly bishops, who excused themselves for fleeing from persecution on the ground that in such times they could not assemble a congregation or celebrate the Sunday rites: 'Sed quomodo colligemus, inquis, quomodo Dominica sollemnia celebrabimus?'[6] From that time onward the position of Sunday as a holy day was unquestioned; and we need trace its history no further.

Just at that point we find the first suggestion of a Sunday holiday. Two sentences of Tertullian are worth quoting, both written while he was still a Catholic. In Sunday worship, he says, Christians avoid every trace of gloom, and even put aside business which might interfere with prayer ('differentes etiam negotia, ne quem diabolo locum demus').[7] And, when he tells the Christians that they have more festivals in the year than the heathen, he implies that Sunday, like a Roman festival, is more or less a holiday: 'Si quid et *carni indulgendum* est, habes, non dicam tuos dies tantum, sed et plures. Nam ethnicis semel annuus dies quisque *festus est, tibi octavus quisque dies.*'[8]

It is to be observed that he compares Sunday with heathen festivals rather than with the Sabbath. So long as Jewish Christianity remained a power, or the hostility of Jews a thing to be feared, Gentile Christians were anxious to repudiate any connexion between the Sabbath and Sunday. The feeling was obviously strong when Ignatius wrote *μηκέτι σαββατίζοντες ἀλλὰ κατὰ κυριακὴν ζῶντες*,[9] and when the author of the *Epistle of Barnabas* described Sunday as *ἄλλου κόσμου ἀρχήν*.[10] Justin Martyr shows its influence when he derives the sanctity of Sunday from the creation and the Resurrection. Although Jewish Christianity disappeared from the West before the end of the 2nd cent., there is plenty of evidence that some of its traditions persisted in the Eastern Church for two hundred

years more. The *Apostolic Constitutions*,[1] *e.g.*, recognized a parallel observance of the Sabbath and Sunday. And the Council of Laodicea (363), while condemning a Judaizing observance of the Sabbath, marked it as a festival and a day of worship. Different as was the East from the West, they were in constant communication; and the maintenance of the Sabbath in the East was a reason for keeping Sunday clear of Sabbatarianism in the West. Egypt, intermediate between East and West, was Western in its observance of Sunday. Accordingly Clement of Alexandria (*c.* 200) says that the Lord's Day is celebrated by putting away evil thoughts and acquiring true knowledge;[2] and Origen (*c.* 240) apologizes for the common observance of Sunday as a concession to the feelings of the weaker brethren. They, 'being either unable or unwilling to keep every day in this manner, require some sensible memorials to prevent spiritual things from passing altogether away from their minds.'[3]

A hundred years later Athanasius wrote to much the same effect: 'We keep no Sabbath day (but) we keep the Lord's Day as a memorial of the beginning of the second new creation.'[4]

St. Jerome follows in the same line. He tells how his party of recluses at Bethlehem attended Church services on Sunday, but otherwise pursued their usual occupations.[5] St. Augustine, while insisting upon the festal character of Sunday—'Dies tamen Dominicus non Judaeis sed Christianis resurrectione Domini declaratus est, et ex illo habere coepit festivitatem suam'[6]—pronounces that the Fourth Commandment is in no literal sense binding upon Christians. His words seem framed to exclude the idea of any transference of obligation from the Sabbath to Sunday.

4. Movement in favour of a day of rest.—While the leaders of the Church gave no sanction to the idea that Sunday was the heir of the Sabbath, that idea was all the time gaining power among the mass of the Christian people in the West. Several causes combined to favour its growth. As the passage quoted above from Tertullian indicates, the numerous heathen festivals constantly suggested that a holy day should be a day of rest. Familiarity with the OT, whose authority was unchallenged, insensibly turned men's thoughts in the direction of Sabbatarianism. Increasing leisure and power enabled many Christians to command a day of rest. Greater stress was laid, as time went on, upon the duty of attendance at the Church services, which in many cases involved the abandonment of regular work. How steadily popular opinion was moving in the direction of a Sunday holiday may be inferred from a resolution passed in 305 by the Council of Illiberis in Spain, making the observance of the Lord's Day compulsory and ordaining that failure to attend the services shall be punished with excommunication. The Sabbatarian movement, therefore, like that for the worship of the saints, came from below. Theologians long resisted it, but at last yielded, and sought for reasons to justify a practice which the people had adopted. Among these we do not usually find either the duty of observing the Fourth Commandment in the spirit or the social need (recognized in Deuteronomy) of a day for rest and recreation. The reasons alleged are of a mystical and symbolical character, such as would naturally suggest themselves to theologians in difficulties. And yet the very contrasts which they draw between the Sabbath and the Lord's Day show the influence of the popular pressure, and prepare the way for the identification of the two which was to come in the 9th century.

St. Ambrose, *e.g.*, describes how the first day has succeeded to the dignity which formerly belonged to the seventh: 'Ubi enim Dominica dies coepit praecellere, qua Dominus resurrexit; Sabbatum, quod primum erat, secundum haberi coepit a primo. *Prima enim requies* cessavit, *secunda* successit.'[7] St. Chrysostom (*c.* 390) goes further. Commenting on 1 Co 16[1], he says that the first day of the week was well chosen for acts of charity, ὅτι καὶ ἄνεσιν ἔχει καὶ πόνων ἀπόλειαν. He thus actually carries back the Sunday rest into the year 57. And, when he writes about Ro 14[5], he asserts that 'esteemeth every day alike' has reference only to fasting. The reason of so strange a misconception is doubtless that he regards the observance of Sunday as a matter of course. Although, therefore, he generally contrasts Sunday and Sabbath in the manner of his time, it is not surprising to find him once coming very near to the later Sabbatarian view. In the 10th *Homily* on Gn 1 he writes: 'God from the first teaches us symbolically to set apart one whole day in the week and devote it to spiritual activities.'

Examples might be given from other writers. But these are enough to indicate the double process which was going on. While the official position of the Church was hostile to Sabbatarianism, the writers could not altogether resist the influence of popular opinion which was steadily moving towards it.

5. Constantine's decree of A.D. 321.—Parallel to the Christian movement in favour of a Sunday rest there seems to have been another, which was quite independent. The matter is obscure, and we must rely in part upon conjecture. As the social and industrial organization of the empire advanced under the Pax Romana, the sporadic festivals of the ancient calendar became more and more inconvenient. The efficiency of labour depends largely upon recreation; but holidays at irregular intervals are not effectual for recreation, and interfere sadly with organization. We can imagine that the heathen often reflected upon the contrast, to which Tertullian points, between the regular weekly festival of the Christians and their own uncertain celebrations; and that they wished that they could exchange their inconvenient holidays for a regular rest on 'the day of the sun.' Some such process of thought in the popular mind is required to explain the readiness with which the whole world, heathen as well as Christian, accepted Constantine's famous decree. Though he was doubtless influenced mainly by the wishes of his Christian supporters, it was not as 'the Lord's Day' but as 'the venerable day of the sun' that he described the new public holiday:

'Omnes judices urbanaeque plebes et cunctarum artium officia venerabili die Solis quiescant. Ruri tamen positi agrorum culturae libere licenterque inserviant, quoniam frequenter evenit ut non aptius alio die frumenta sulcis aut vineae scrobibus mandentur, ne occasione momenti pereat commoditas coelesti provisione concessa.'[1]

There has been much speculation about Constantine's motives. Eusebius would persuade us that they were wholly religious,[2] others that social and political considerations determined his action; but we have not sufficient evidence to decide the question. One thing is certain. The edict of A.D. 321 marks an epoch in the history of Sunday. It was the parent of a double series of legal enactments and conciliar decrees which exercised a great influence—both for good and for evil—upon the life of all Europe during many centuries.

6. Later imperial decrees.—With regard to the imperial decrees, it is important to remember that they affected an ever-decreasing area. The laws of Theodosius the Great, which forbade all litigation and the spectacles of the theatre and the circus on the 'dies Solis quem Dominicum rite dixere majores' (386), affected mankind from Spain to Mesopotamia. But its reiteration by Leo and Anthemius (469) was addressed only to Turkey, Greece, Asia Minor, Syria, and Egypt. The chief importance of those later decrees is that, enshrined in Justinian's Code, they set up a standard for the new nations which gradually rose out of the flood of barbarian invasion.

7. Decrees of Church Councils (300–600).—On the other hand, the decrees of Church Councils had an immediate influence not only in the areas which they represented but also to some extent throughout the former Roman Empire, for the Church maintained a large degree of unity. It is therefore worth while to record not only how the Council of Laodicea (363), ordering men to work on the Sabbath, bade them τὴν Κυριακὴν προτιμῶντες, εἴ γε δύναιντο, σχολάζειν ὡς χριστιανοί, but also how the Council of Orleans (538), while protesting

against an excessive Sabbatarianism, forbade all field work under pain of censure; and the Council of Macon (585) laid down that the Lord's Day 'is the day of perpetual rest, which is suggested to us by the type of the seventh day in the law and the prophets,' and ordered a complete cessation of all kinds of business. How far the movement had gone by the end of the 6th cent. is shown by a letter of Gregory the Great[1] (pope 590–604) protesting against the prohibition of baths on Sunday.

8. Sabbatarian movement (600–800).—It was a right instinct which led the people to demand, and emperors and councils to grant, that Sunday should be a day of rest as well as of worship. Up to the end of the 6th cent. the resultant changes in law and custom, in spite of some extravagances, were on the whole beneficial. But in the darkness of the next two centuries other influences came into play. The ceaseless wars and disorders which lowered the standard of civilization both in the Eastern Empire and in Western Europe threw all initiative into the hands of military or ecclesiastical rulers. Changes were no longer made in response to the people's demand, but were imposed upon them by rulers who were guided not by a sense of practical need but by monkish theory. Thus an edict[2] of Clotaire III. (*c.* 660) forbids servile labour on Sunday.

'Quia hoc lex prohibet et sacra scriptura in omnibus contradicit.'

Among the laws of Ine, king of Wessex (*c.* 690), we find the following:

'If a "theowman" work on Sunday by his lord's command, let him be free; and let the lord pay xxx shillings as "wite." But if the "theow" work without his knowledge, let him suffer in his hide, or in "hide-gild." But if a freeman work on that day without his lord's command, let him forfeit his freedom, or sixty shillings: and be a priest doubly liable.'[3]

9. The Christian Sabbath from 800 to 1500.—(*a*) *Decrees of rulers and councils.*—Though the decrees of the 7th and 8th centuries were obviously part of a Sabbatarian movement, the term 'Sabbath' was not applied to Sunday until Alcuin had written:

'Cujus observationem mos Christianus ad diem dominicum competentius transtulit.'[4]

Under his inspiration the new feeling, long fluid in society, was crystallized in Charlemagne's decree of A.D. 789, which forbade all ordinary labour on Sunday as a breach of the Fourth Commandment. In particular it forbade agricultural labour, which Constantine had expressly permitted, and the holding of markets, which Constantine had appointed in order to encourage country people to attend the church services: 'Provisione pietatis suae nundinas die solis perpeti anno constituit.'[5] From that time onward the identification of Sunday with the Sabbath was taken for granted, and from that principle deductions of increasing severity were drawn by princes and ecclesiastics.

Among the decrees which were issued by princes for their own dominions we may mention that of the emperor Leo (*c.* 900) which forbade agricultural work in the Eastern Empire, and that of Edgar the Peaceable (A.D. 958) which extended the Lord's Day from 3 p.m. on Saturday to Monday's dawn. More interesting, because of wider influence, are the pronouncements of leading churchmen. In the 12th cent., *e.g.*, Bernard of Clairvaux maintained that the Fourth Commandment required the Sabbatical observance not only of Sundays but also of holy days. In the 13th cent. Thomas Aquinas lent his immense authority to the same principle: 'Sabbatum . . . mutatur in diem dominicam . . . Similiter aliis solennitatibus veteris legis novae solennitates succedunt.'[6] In the 15th cent. Tostatus, bishop of Avila, a learned canonist, laid down the law of the Christian Sabbath with a fullness of detail which rivals that of the Pharisees. And the precepts of the learned were enforced and illustrated for the multitude by stories of miraculous judgments—ranging from toothache to sudden death—which had fallen upon those who profaned Sunday or Saint's Day by labour.[1]

For five hundred years after Charlemagne Church Councils were much occupied with questions of Sunday observance. The following examples may perhaps be sufficient for the purpose of illustration:

A.D. 829—The Council of Paris re-enacts the prohibition of ploughing, marketing, and law business on Sunday.[2]

853—A Synod at Rome forbids markets and field labour.[3]

1009—A Council at Hexham (? Eingthamense) forbids markets, fairs, hunting, and ordinary labour.[4]

1031—The Council of Bourges forbids travelling, except in cases of necessity or charity.[4]

1050—The Council of Coyac (in Spain) forbids all 'servile work' and all travelling.[4]

1212—The Council of Pamiers commands all parishioners to hear *the whole* of the mass and preaching.[4]

1244—The Synod of Lyons found it necessary to limit the number of holy days, whose increase was causing various abuses.[5]

1322—The Synod of Valladolid ordained 'quod nullus in diebus Dominicis et Festivis agros colere audeat, aut manualia artificia exercere praesumat, nisi urgente necessitate, vel evidentis pietatis causa.'[4]

(*b*) *How Sunday was observed.*—What was the effect of all these exhortations? The constant reiteration of the same orders is general evidence that they had not been obeyed. But particular evidence is not lacking. In 1226, *e.g.*, the prior of Walsingham, who held a market on Saturday and Sunday, granted half the profits to Sir William de Clare in exchange for other rights.[6] And the records tell not only of journeys which emperors and kings made on Sunday, but also of three emperors who were crowned in St. Peter's at Rome on that day, causing thereby an immense amount of labour.[7] Sunday, therefore, was not generally observed with anything like the strictness which Church authorities enjoined. Yet it was to a large extent observed as a holiday and a day of worship. How were the hours of leisure spent? In all the decrees of Councils and pronouncements of individuals, down to the 15th cent., there is no prohibition of any recreation except dancing, the singing of ribald songs, theatrical performances, and races in the circus.[8] The last two prohibitions of the emperor Leo soon became needless, for theatre and circus ceased to exist. So from 900 till the Reformation there was practically no limit set to the amusements of the people on Sunday. What use was made of that liberty we may infer partly from the decrees of Councils in the 16th cent. and partly from the Puritan reaction which soon began in Protestant countries.

10. The Roman Catholic Sunday in the 16th century.—The Council of Cologne[9] (1536) decrees:

'Cupimus his diebus prohiberi nundinas, claudi cauponas, vitari comissationes, ebrietates, sumptus, lites, lusus improbos, choreas plenas insaniis, colloquia prava, cantilenas turpes, breviter omnem luxum.'

The Council of Milan (1573) complains that Sunday is commonly profaned by markets, open shops, hawking, dicing, sports, conjuring, and theatrical performances. The Council of Rheims (1583) decrees:

'Nemo lusibus et choreis det operam. Venditiones quarumcunque rerum, his exceptis quae ad divinum cultum et victum necessarium pertinent, nundinae publicae, mercatus et auctiones, ne fiant diebus festis. Ludos etiam theatrales, etiam praetextu consuetudinis, prohibemus.'

The Council of Narbonne (1609) protests against the profanation of Sunday by dancing, singing,

hunting, hawking, markets, public feasts, and revelling, and allows none but travellers to be served in the inns.

These quotations prove that the Counter-Reformation led the authorities of the countries which remained Roman Catholic to recognize a duty with regard not only to Sunday labour but also to Sunday recreations. They seriously endeavoured to check the licence which had been allowed for many ages and had doubtless increased with the advance of material prosperity in the 14th and 15th centuries. It is difficult to estimate how far they succeeded in reforming the manners of the people. Peter Heylin, sub-dean of Westminster, whose *History of the Sabbath* is the most valuable book on the subject, is an important witness, for he travelled on the Continent very soon after the close of the 16th century. He sums up his impressions in these words:

'Nor is their discipline so severe as their Canons neither. So that the Lord's Day there, for ought I could observe, when I was amongst them, is solemnised after the same manner as with us in England: repairing to the Church, both at Masse and Vespers, riding abroad or walking forth to take the ayre, or otherwise to refresh themselves, and following their honest pleasures, at such leisure times as are not destinate to the publick meetings: the people not being barred from travelling about their lawful business, as occasion is, so they reserve sometime for their devotions in the publike.'[1]

But Heylin, as an advocate, looks only on the fair side; and undoubtedly (as the decrees of the Councils imply) there were many regions in which Sunday was spoiled both by needless labours and by the coarsest amusements.

11. The Protestant Sunday in the 16th century.—The Reformers of the 16th cent. were in a difficult position, for, although they regarded both Gn 2 and Ex 20 as historical, they could not rest the institution of Sunday on either of the traditional grounds. They could not identify it with the Jewish Sabbath; nor could they admit that an ecclesiastical rule of observance, however venerable, was of unchangeable validity. Yet both feeling and reason urged them to maintain its obligation. Luther, Calvin, and the various catechisms and confessions put forward much the same view—to this effect:

The Fourth Commandment was abrogated by the New Testament: and ideally there should be no distinction between days. But human nature requires a day of rest from labour: the soul demands leisure for joint worship: therefore a day must be fixed for all. We cannot do better than follow the tradition which sets apart the first day of the week.[2]

Sound as that argument was, it had an unfortunate effect upon the minds of a generation who had been trained to rest upon absolute law and were not ready to accept reason in its place. To a vast number of Protestants Sunday appeared to have lost its authority; and there was a decided slackening of its observance. Heylin thus describes the state of things in the latter part of the century:

'There was no restraint on Sundays in the afternoone, from any kind of servile work, or dayly labours; but that men might and did apply themselves to their severall businesses, as on other days. As for the greater townes, there is scarce any of them, wherein there are not Faires and Markets (Kirk Masses, as they used to call them) upon the Sunday: and those as much frequented in the afternoone as were the Churches in the forenoone. . . . So that in generall the Lord's day is no otherwise observed with them . . . than an half holiday is with us. . . . For recreations, last of all, there is no question to be made, but that where working is permitted, and most kinde of businesse, a man may lawfully enjoy himselfe and his honest pleasures; and without danger of offence pursue those pastimes by which the mind may be refreshed and the spirits quickened.'[3]

This is true, he says, of Holland, Belgium, Switzerland, France, and Germany, and part of Poland.

In England, where religious changes were far less violent, the observance of Sunday in the reigns of Henry VIII. and Elizabeth was considerably stricter.

Both *The Institution of a Christian Man* (1537) and the queen's *Injunctions* (1558) lay down excellent principles. And yet one of the *Homilies*, published in 1563, sorrowfully confesses: 'The Lord was more dishonoured and the Devill better served on Sunday than upon all the dayes in the weeke besides.' King James's proclamation of 7th May 1603 is a significant confirmation of this complaint: Having been informed 'that there had been in former times a great neglect in keeping the Sabbath day,' he ordains 'that no Bearebaiting, Bull-baiting, Enterludes, common Playes, or other like disordered or unlawful Exercises or Pastimes be frequented, kept, or used at any time hereafter upon any Sabbath day.' And this was not because James was accustomed to great strictness in Scotland, where up to 1600 observance was on the whole less precise than in England. The early Calvinists were not Sabbatarians, and John Knox himself played bowls on Sunday.

12. The 17th and 18th centuries.—(*a*) *England.*—Till the reign of James I., as we have seen, England and Scotland kept pace with the movements on the Continent. But throughout the 17th cent. our island was the scene of a dramatic struggle which had no parallel elsewhere. The extreme Protestant type of mind has a natural affinity to the OT, and the Calvinists and other Puritan sects early felt the attraction. By a process somewhat like that which took place in the 5th and 6th centuries, they turned towards the Jewish Sabbath, and their steps were hastened by repulsion from the scandals of the 16th cent. Sunday. The movement, of which the early stages are obscure, came to a head in the publication of a remarkable book.

Nicholas Bownd, a Suffolk clergyman, in his *Sabbathum Veteris et Novi Testamenti*, or the *True Doctrine of the Sabbath* (1595), boldly and crudely claimed for Sunday the authority and the observances of the Jewish Sabbath and maintained that they should be enforced by the State. The book had an immense vogue. It was translated and circulated on the Continent, where it exercised much influence. In England, accepted as an inspiration by some and as a challenge by others, it gave rise to a literary controversy which lasted for a hundred years. The first reply to it was James I.'s *Book of Sports*[1] (1618), which proclaimed liberty for the people to enjoy their traditional pastimes on Sunday except bull- and bear-baiting. This was followed by the Sunday Observance Act (1625), which forbade men to go outside their own parishes in search of amusement on Sunday. The *Book of Sports* was republished by Charles I. in 1633, with a special admonition to justices of the peace: 'Look to it, both that all disorders there may be prevented and punished, and that all neighbourhood and freedom, with manlike and lawful exercises, be used.'

In 1635 Francis White, bishop of Ely, published an official defence of this view; and in 1638 Heylin supported it with *The History of the Sabbath*, a book which shows much ability and learning. The controversy was continued, and 120 books on the subject were published in the next hundred years. Other weapons were used besides the pen. In 1643 Parliament ordered the *Book of Sports* to be burned by the hangman and imposed the Puritan Sabbath upon the ever-increasing area which their troops commanded. In 1648 they formally adopted the *Westminster Confession* and the *Longer* and the *Shorter Catechisms*. One quotation from the last-named must suffice.

'Q. 60. How is the Sabbath to be sanctified?—A. The Sabbath is to be sanctified by a holy resting all that day, even from such worldly employments and recreations as are lawful on other days; and spending the whole time in the public and private exercises of God's worship, except so much as is to be taken up in the works of necessity and mercy.'

By successive enactments (1644, 1650, 1656) the same Parliament proscribed every kind of Sunday recreation, even 'vainly and profanely' walking for pleasure. At the Restoration the pendulum swung the other way. The court, the cavaliers, and the High Church clergy led the way in a violent reaction; and the return of the Prayer-book service on Sunday morning was accompanied by trading, open theatres, and ostentatious frivolity

in the afternoon and evening. To what lengths the court went may be learned from Macaulay's description of Charles II.'s last Sunday night. There were many protests; and the battle of the books continued, Bishop Pearson, John Owen, and Richard Baxter being among the combatants. In 1677 a compromise was effected. The Sunday Observance Act regulated trade, labour, and travelling in a reasonable way, making ample allowance for 'works of necessity.' At the same time the Sunday Observance Act of 1625 was revived and came to be recognized as the standard by which amusements were to be regulated. Both acts were observed with varying degrees of strictness at different times and in different places. But it is no little tribute to their reasonableness that both remained in force until the year 1871, though they were modified in some details; *e.g.*, in 1699 forty watermen were allowed to ply on the Thames, in 1710 coaches and chairs received permission to stand for hire, and in 1794 bakers to sell bread at certain hours. From the Revolution to the death of Queen Anne a higher standard prevailed, both of attendance at church and of obedience to the law. Under the Georges, though no change was made in the law, and though the same literary controversy continued, there was a steady decline in both respects. About 1780 the Evangelical Revival, following the movement led by the Wesleys, produced a considerable change in opinion and observance. How much need there was for improvement may be inferred from three actions of Bishop Porteous, who was a leader of the new school. He supported the institution of Sunday Schools, which began in 1780 and soon spread over the country. He persuaded the Prince of Wales to transfer the meetings of his rowdy 'Sunday Club' to a week day. And he drew up the Sunday Observance Act of 1781, which enacts that any place of public entertainment or debate where a charge is made for admission may be deemed a disorderly house. Passed in order to check bear-baiting and infidel propaganda, this act has been used of late to impede Sunday concerts and lectures to working-men.[1] For many years it was undoubtedly of great value, helping to restore the credit of Sunday in the public eye. But, when the rapid growth of large towns, due to the industrial revolution, presented new problems, this law combined with the restrictions of travelling to cause mischief. The mass of the industrial population, cooped up in towns which were almost destitute of churches, had no meeting-place but the street or the public-house. This evil became serious in the latter part of the 18th cent., but its full development was not seen till the 19th.

(*b*) *Scotland.*—Scotland very early in the 17th cent. adopted the theory of the 'Christian Sabbath' and applied it to social life with the ruthless logic which is characteristic of Calvinism. The *Westminster Confession* was adopted by the General Assembly of the Kirk of Scotland in 1647, before Parliament had passed it; and it has remained the formal standard of faith to the present day. So long as it was enforced by public opinion—*i.e.* till about 1870—the Scottish Sunday was observed with amazing rigour. Not only were ordinary recreations disallowed; a ban was put even upon books and music, except such as were recognized as religious in the narrow sense. No recreation remained but whisky-drinking, and a great part of the drunkenness which is still common in Scotland may be traced to an unwise Sabbatarianism. In parts of the Highlands and the Islands the old rigour remains; but in the greater part of the country, as will be explained below, the last fifty years have witnessed a great change.

(*c*) *America.*—The American colonies differed in their practice. The more southerly States, such as Pennsylvania and Virginia, were inclined to English views of Sunday. The New England States, founded by Puritans, kept very close to the Scottish standard; but their coast towns were influenced by English practice, and their Western border by the practical necessities imposed by danger from their Indian neighbours.

(*d*) *Protestant Europe.*—Nicholas Bownd's book was translated into several Continental languages and exercised a considerable influence. In Holland and Switzerland a strong Sabbatarian party grew up; and in Protestant Germany his doctrine found rigorous advocates. But on the whole the Sabbatarians failed; and the observance of Sunday, especially in Germany, fell much below the standard in England. Sunday labour was very common, and Sunday amusements were very coarse.

(*e*) *Roman Catholic Europe.*—In Roman Catholic countries, during the same centuries, Sunday was so much eclipsed by the Saints' Days that it ceased to be observed with any kind of strictness. While the Saints' Days were real holidays, labour on Sunday was the rule rather than the exception. Till near the end of the 18th cent. the priesthood were powerful enough to secure a general attendance at mass; but the rest of the day was usually given to ordinary occupations. If in Spain Sunday was more a day of rest than in France or Italy, this was because it was the day set apart for bull-fights.

13. From the French Revolution to 1848.—The French Revolution marks an epoch in the history of Sunday observance. Its new calendar, with a week of ten days, though ephemeral and rather absurd, was a practical challenge to tradition, whose effects were permanent. The questions which it raised frightened some men into reaction, but excited others to free speculation. And it gave prominence to one fact, which no Government could afford to ignore for long. In every country there was an increasing number of citizens who did not acknowledge the Christian sanctions for Sunday, for whom, therefore, any rules for Sunday observance must rest on social rather than religious grounds. The recognition of this fact gradually affected the administration of the existing laws; and perhaps it may account for the complete absence of legislation between 1780 and 1850. In England the repulsion caused by the Revolution combined with the Evangelical Revival to render Sunday observance much stricter. The laws of 1677 and 1781 were rather rigidly enforced, and public opinion (among the minority who had votes for Parliament) was on the whole Sabbatarian. For the middle class and for all the people in country districts the movement was largely beneficial. The churches were filled; the sense of duty was strengthened; and habits of reflexion were induced. On the other hand, for the growing multitudes in the great towns the restrictions imposed by law became ever more cruel. Neglected by the Church, they had few places of worship and little will to enter them. They wanted means of getting into the country and opportunities of reasonable recreation in the town; but these were denied them, and nothing was left but the public-house. It was not till about 1850 that their needs were recognized. The active controversy which was carried on about Sunday concerned only the reasons for observing it. Several distinguished writers took part in the discussion, but they did little more than reproduce the well-worn arguments of the 17th cent. on either side.

[1] The present writer was threatened with prosecution in 1897 for lecturing to a Sunday Society in Bristol.

In France, though Napoleon re-established the Church, the hold of Sunday upon the public mind could not be restored. It remained to a large extent a day of trade and of labour, as well as of social amusement. In Spain and Italy there was no striking change. In Germany, which had been penetrated with French ideas, there was a marked decline. If we may judge by the books which were published there between 1780 and 1848, public opinion was averse to strictness based on religious grounds and not yet alive to the social reasons in favour of a day of rest. Sunday observance therefore, resting mainly upon tradition, naturally failed to maintain its hold.

The United States continued the division of opinion which had existed among the colonies of N. America. New England and the Western States, which were gradually peopled by emigrants from New England, remained Sabbatarian, while the Southern States, led by the Quakers of Pennsylvania, generally adopted the more liberal view. Between 1820 and 1850 many books were published on both sides, but no legislation resulted.

14. From 1848 to 1914.—From 1848, the 'year of revolution,' we may date a new phase of the Sunday controversy. Suddenly the masses of the people, especially in manufacturing towns, acquired a new consciousness and began to be regarded with a new interest. The consequences were not long in making themselves felt. Hitherto it may be said that the churches and the legislatures had, on the whole, worked in harmony. Since 1848 there has been a gradual divergence. For, while the churches were slow to admit the possibility of change, the legislatures, more and more influenced by popular opinion, tended to favour relaxations which were supposed to be required by new social conditions. At the same time an agitation began in some countries in favour of limiting the Sunday labour which vast numbers felt to be oppressive. These two elements were mixed in very different proportions in different countries.

(*a*) *England.*—In England, where Sunday labour was already severely limited, the main question was that of relaxation. In 1851 a lively controversy arose about two points. Should railway travelling be allowed on Sunday? And should the new Crystal Palace be open to the public on Sunday afternoon? The instances could not have been better chosen, for their discussion involved all the main principles which were at stake. Twenty years passed before any legislative result came of the debate. In 1871 an Act was passed requiring the consent in writing of the chief officer of a police district, or of two magistrates, before a prosecution for Sunday trading could be instituted under the Act of 1677. Since then the Sunday Observance Act has been a dead letter. And an Act of 1875 has very much limited the application of the Act of 1781. That did not end the debate. In 1875 the Sunday League was formed to advocate the opening of museums and picture galleries and other means of rational recreation on Sundays. In spite of several societies started in opposition, the Sunday League has gradually effected a great and beneficial change.

But the real crux of the situation is connected with travelling. Nothing has done so much to alter the habits of the people as the rapid increase in means of communication. The railway, the steamer, the tramcar, and the motor-car have successively helped to empty the towns on Sunday. They have answered a real need; for the strain of modern life has created a new craving for fresh air and change of scene, which finds satisfaction in the week-end habit of the richer folk and in the excursion train for the poorer. The desire for such recreation is natural and wholesome. At the same time it is responsible for two serious evils. (1) Those who spend Sunday away from home rarely devote any part of it to worship, and those who remain at home feel themselves thereby excused from attendance at church. Consequently the number of those who enter any place of worship on Sunday forms an increasingly small percentage of the population. (2) Every added facility for travel on Sunday involves additional labour on the part of a large class of workers. The railways, the tramways, the restaurants, the bands, and the news agencies are so heavily tasked on Sunday that few of their employees enjoy anything like a day of rest.

Intent upon claiming what they considered their right to recreation and convenience, the mass of the people did not see what was involved in its satisfaction. Shops were increasingly opened, trains ran in ever-increasing numbers, and a large number of subsidiary industries were obliged to join the movement. Then contractors who were in a hurry took to Sunday work; and there was a real danger that the industrial population might lose their day of rest. About the beginning of the 20th cent. the trade unions and other bodies began to realize the danger; shop-assistants began to protest; and so a check was imposed upon the movement. In the first year (1914–15) of the Great War it seemed as if the national necessity might obliterate Sunday rest. Munition factories and many others were opened on Sunday, and double pay was offered for work on that day. But the result was uniformly a diminished output. Many of those who worked on Sunday for double pay spent the extra money in drink on Monday and Tuesday; and such as conscientiously toiled all seven days did so with rapidly failing energy. After two years Sunday work was generally abandoned; and it may be hoped that the nation has taken the lesson to heart.

(*b*) *The Continent.*—On the Continent during the latter half of the 19th cent. the same causes produced even more marked effects. In the eighties and nineties a stranger could hardly tell from the aspect of the towns whether the day was Sunday or not. But at last even the 'anti-clerical' Governments, which had looked on complacently at a change which diminished religious observance, became aware that it was causing immense social mischief; while on behalf of the overstrained workers urgent claims were made for a legal day of rest. Between the years 1895 and 1910 laws were passed, in almost every country of Europe, which were intended to secure a weekly holiday for every working-man.[1] Even in France, where the secularist influences were strongest, it was judged necessary to insist upon Sunday as the normal day of rest, all substitutes in special cases being regarded as exceptional. The general effect of this movement was a marked change in the aspect of the towns. In the year 1913 no factories were working on Sundays, and few shops were opened. Thus in a large measure Sunday observance has been restored, but with a difference. It is now popularly regarded, not primarily as a response to the religious need of worship, still less as obedience to a divine command, but as the condition of wholesome life for the labouring man.

15. The present state of the question.—The foregoing narrative should help us to discern the principles upon which Sunday observance ought to be based, and perhaps to determine the proper mode of observance, and the means by which it may rightly be enforced or encouraged.

Why is Sunday to be observed? It is easier for us to answer this question than it was for the theologians of the 17th and 18th centuries, and that for two reasons. Recent investigations into early Church history, of which the results are summarized above, have removed some prejudices which hampered our ancestors. We now know how gradually the observance of Sunday developed and how late was the theory which connected it with the Sabbath. And the modern study of the

[1] See the return made to the House of Lords on the subject in 1911.

OT has removed a difficulty which they could never fully meet. So long as the story of the creation in Gn 1 and 2 and the account of the giving of the Law on Mt. Sinai were regarded as historical, the question had to be faced: How can a divine command, directly given to men, be abrogated? The answer for us is plain: No such commands were ever given, and the stories which record them are legends. The Sabbath was made for man; and, under the guidance of Providence, it was made by man. Sunday, in its turn, was made by man and for man. Man, therefore, is lord both of the Sabbath and of Sunday. It is from the experience of men, both as individuals and in societies, that the reasons must be drawn which determine the manner in which Sunday is to be observed.

(*a*) *The new reasons for observing Sunday.*— These reasons are evidently of two kinds, answering to the conditions required for bodily vigour and spiritual health. While the former may be regarded as especially the concern of the State and the latter of the Church, the mutual influences of body and mind are so considerable and so intricate that in practice it is hard to draw a line between the sphere of politics and that of religion. It is all the harder because to ancient thought the distinction was unknown, and even in modern times is largely artificial. For the Church cannot ignore the body, nor can the State disregard the interests of the spirit. But happily no sharp division is necessary. The reasons given by the Reformers[1] are of general application and may satisfy both the Churchman and the statesman. Since three hundred years of controversy have added nothing substantial to them, we may be content with restating them in a more detailed form.

The need of bodily rest at short intervals is a fact of human nature which all civilized nations have recognized by instituting public holidays. The more complex the social and industrial organization, the more important it becomes that such holidays should recur at regular intervals. The sporadic festivals of the ancient Roman calendar and the Saints' Day system of modern Italy could not be tolerated in an industrial country; for production depends upon regularity of labour and the efficiency of labour upon regularity of recreation. Constantine's decree of A.D. 321, therefore, not only conferred a benefit upon the individual and satisfied a requirement of the Church, but also solved economic and social problems which were growing very difficult. Its wisdom is proved by the fact that, in spite of occasional protests and experiments, the Sunday holiday has remained the rule of civilized countries ever since.

The well-being of the people, which is the proper object of government, demands more than mere cessation of work at sufficient intervals. The life of the citizen is incomplete, and his value to the State is small, unless he cultivates his mind, develops family affection, and enjoys social intercourse. All these functions require leisure—not merely the tired hours after a day's work, but whole days when the time can be disposed of at will. It is in days of leisure, also, that personality has the best chance of development. The State, therefore, has a responsibility, not only for appointing holidays, but also for preventing such misuse of them as may diminish their value to the citizen and to the community. On the other hand, experience proves such responsibility to be of a negative rather than a positive character. The State can remove obstacles to a right course of action, but cannot compel the individual to walk therein. If any positive commands are laid down for the weekly holiday, they must issue from a religious authority, which appeals only to spiritual sanctions, and affects only those who acknowledge its right. The Christian Church is such an authority, and has strong reasons, besides those just mentioned, for requiring its members to observe Sunday. Putting aside the mistaken claims for Sunday, which originated in the dark ages and were so hotly urged in the 17th cent., there remain some which are undeniable. The spiritual life of the individual requires a recurrent leisure time, in which he may read or meditate, may do acts of charity, and commune with his friends, with nature, or art. It requires, also, regular opportunities of joining in common worship, without which his membership of a Church becomes unreal. The former demand might be satisfied by times of leisure peculiar to himself. But the latter involves regular holidays which are common to all. Nor can it be a matter of indifference whether these holidays fall on Sundays. The power of association and tradition is enormous: no man can escape from it, and no Church can ignore it. To substitute another day would be to waste the accumulated associations and traditions of nearly 2000 years which are concentrated on Sunday. For on the Lord's Day Jesus rose from the dead; on that day, ever since, His disciples have met for worship and mutual comfort; on that day they have joined in the feast of His love. Luther did not state the whole case when he wrote: 'Because Sunday has been appointed from the earliest times, we ought to keep to this arrangement, that all things may be done in harmony and order, and no confusion be caused by unnecessary novelties';[1] for he ignored one of the strongest impulses in human nature.

(*b*) *The mode of observance.* — Assuming the above reasons for the observance of Sunday, we have to consider, from the point of view of Church and State, what ought to be the manner of its observance. The action of the State in such matters, as we have indicated already, is mainly negative. It has to protect the worker against the oppression of unbroken labour, to secure for him a regular period of recreation, and to prevent other persons from interfering, whether by force or by bribery, with his reasonable use of his leisure time. That task is not so simple as might appear. Every right, when exercised, imposes a duty upon some one else. The right to food involves the Sunday labour of the milkman; the right of the public to enjoy works of art encroaches upon the leisure of the custodians; the right to fresh air and green fields compels the toil of the railwayman. These classes also have their rights, which must somehow be safeguarded. To adjust conflicting claims in the interest of the people as a whole is a work of much insight and patience; nor can it be accomplished once for all, since every enlargement in the tastes and interests of the many involves a fresh tax upon the ministrations of a few. In Britain, happily, men seem to be approaching a general agreement about the main principles of such accommodations. No man should be required or encouraged to work on Sunday except for the benefit of a large number. The railwayman, the custodian of a picture gallery, or the musician who plays in a band, is engaged in a work of charity, if he is not adding a seventh working day to his week for the sake of profit. No such plea can be made on behalf of a manager who makes profit by the performances of others, or of a tradesman who opens his shops on Sunday. A partial exception is rightly made in the case of those who supply the public with needed refreshments. But even that requires careful watching;

[1] See above, § 11.

[1] *Larger Catechism.*

and the Government has long recognized the duty of limiting the sale of intoxicants to certain hours of the day.

The action of the Church, on the other hand, is positive. It aspires to guide men in their use of the leisure which is secured to them by the State. The primary duty which it inculcates upon all is that of attendance at public worship, for which the Sunday rest was originally instituted. But it also indicates proper uses for the hours which are not spent in such attendance. In the past such guidance took the form mainly of prohibitions. We have seen that, when the prohibitions were few, the result was licence; and, when they were multiplied, Sunday became a day of gloom and boredom. Not to speak of the Scottish 'Sabbath,' which has become proverbial, the restraints were mischievous enough in England till past the middle of the 19th century. The children of pious parents might not play on Sunday except with a Noah's ark. Boys and girls might not take exercise, but sat wearily still. Their elders, limited to 'religious' books or 'sacred' music, took refuge in sleep. Much harm was done to the cause of religion by such observances, and still more by the opposition which Churchmen raised in Parliament to every proposal for allowing rational entertainments for the artisans of the great towns.

A better spirit now prevails. But, while there is little of coercion by Church authority, there is very little of positive suggestion. The time has come when the Christian Church as a whole must formulate something like a programme, instead of leaving Sunday progress to individual experiment. Some such statement of principles as the following, if issued by authority, would relieve many troubled consciences and prevent much revolt.

(1) Sunday is the day for Christians to join in worship. No man spends it well who does not habitually unite with his neighbours in praise and prayer.

(2) Sunday is a day of recreation. Recreation means different things for different people, since an essential feature of it is change. The manual labourer will rest his body; the brain worker will seek exercise; both alike will be the better for a visit to a picture-gallery, or a concert, or a talk with friends.

(3) Sunday is the festival of family life. It is the only day on which most fathers can see much of their children. Unless some hours of the day are employed in cultivating family affection, its ties will be dangerously relaxed.

(4) Sunday is the day for meditation. The average man, if he does not devote some part of Sunday to reading or thought about matters outside his daily occupations, becomes a slave to routine and no longer possesses his own soul.

(c) *How far observance can be enforced.*—By what means can the due observance of Sunday be promoted? The primitive Church punished some offenders with excommunication; the mediæval Church employed the method of penance on a large scale. Both these weapons are now out of date; and they were never of much use for promoting what is best. In proportion as her rules advance from 'thou shalt not' to 'thou shalt,' the Church is less and less able to use any kind of compulsion. She cannot, in fact, compel her members to-day; she can only persuade them through the teaching of ministers and the opinion of neighbours.

The State, on the other hand, just because its commands are nearly all prohibitions, whose object is to protect the rights and interests of the community, can and must use compulsion. Every breach of positive law can be measured and punished by fine or imprisonment. Yet the main influence is really that of public opinion; for the magistrates and police, who administer the law, will always be strict or lax according to the general feeling of the society in which they live. The best means therefore of securing a proper observance of Sunday is to educate public opinion.

LITERATURE.—Many hundreds of volumes have been written on this subject. A very good account of some 300 will be found in Robert Cox, *The Literature of the Sabbath Question*, 2 vols., Edinburgh, 1865. A few of them are historical, but the mass are arguments for and against the obligation of the Sabbath, in which the same ideas (very few) recur over and over again. The following short list gives specimens of the writings of different countries and denominations. The English predominate, for England has produced far more books than all the other countries put together.

(i.) *15th century*—Thomas Aquinas, *Exposition of the Commandments*.

(ii.) *16th century*.—Martin Luther, *Larger Catechism* and other books; John Calvin, *Institutes*, bk. ii. ch. viii.; Philip Melanchthon, *The Augsburg Confession*; Thomas Cranmer, *A Confutation of Unwritten Verities*; Richard Hooker, *Ecclesiastical Polity*, v. 69–71.

(iii.) *17th century*.—Nicholas Bownde, *Sabbathum Veteris et Novi Testamenti* or *The True Doctrine of the Sabbath*, London, 1595, 41606; King James I., *The Book of Sports*, do. 1618; Francis White, *A Treatise of the Sabbath Day*, do. 1635; Peter Heylin, *The Hist. of the Sabbath*, do. 1636; Hugo Grotius, *De Veritate Religionis Christianæ*, Amsterdam, 1627, reprint, Glasgow, 1745, bk. v.; *The Westminster Confession of Faith* and *Catechisms*, London, 1647, 1648; John Cocceius, *Indagatio Naturæ Sabbati*, Leyden, 1658; Edward Stillingfleet, *Irenicum*, London, 1659; Richard Baxter, *The Divine Appointment of the Lord's Day proved*, do. 1671.

(iv.) *18th century*. — Thomas Morer, Κυριακὴ Ἡμέρα, London, 1701; Jonathan Edwards, 'On the Perpetuity and Change of the Sabbath,' Sermons xiii., xiv., xv., in *Twenty Sermons on Various Subjects*, Edinburgh, 1804; Isaac Watts, *The Holiness of Times, Places and People*, London, 1733, Discourse i., 'On the Perpetuity of a Sabbath'; *An Act for preventing certain Abuses and Profanations on the Lord's Day*, 1781; *Decree of the National Convention of France appointing a new Calendar*, 1793; Beilby Porteous, *A Letter to the Clergy of the Diocese of London*, London, 1789.

(v.) *19th century*. — *Report of the Lord's Day Observance Society*, 1832; 'Edinensis,' *Sunday Railway Travelling*, Edinburgh, 1847; J. A. Hessey, *Sunday: its Origin, Hist. and present Obligations* (*BL*), London, 1860, 51889; *Report of a Committee of Congress* (U.S.A. 1833); *Report of the Committee of the Legislature of New York, on the Judiciary*, 1838; E. W. Hengstenberg, *Über den Tag des Herrn*, Berlin, 1852, Eng. tr. London, 1853; François Perennès, *De l'Institution du dimanche*, Paris, 1844; P. J. Proudhon, *De la Célébration du dimanche*, do. 1848; W. F. Crafts, *The Sabbath for Man*, New York, 1885; J. Lefort, *Du Repos hebdomadaire*, etc., Paris, 1873; C. Büttner, *Die Sonntagsruhe im Gewerbebetrieb und im Handelsgewerbe*, Leipzig, 1895.

Heylin and Hessey treat the question historically and with much ability. Parts of the history are well treated in articles and special chapters: Smith's *DCA*, *s.v.* 'Lord's Day'; *EBr*11, *s.v.* 'Sunday' (deals chiefly with legislation); *PRE*3, *s.v.* 'Sonntagsfeier'; *HDB*, *s.vv.* 'Lord's Day' and 'Sabbath' There is also a good chapter (ch. vii.) in W. E. H. Lecky, *Democracy and Liberty*, 2 vols., London, 1896.

M. G. GLAZEBROOK.

SUNDAY SCHOOLS.—1. Origin.—The history of the Sunday school is not the history of religious education. The latter has always existed; the former is a modern institution. The Sunday school is a voluntary lay organization conducting religious instruction in classes on Sunday, generally but not always in church buildings, generally but not always as part of a church organization. The informal instruction that was probably given by teachers in the early Christian communities was somewhat akin to the activity of the Sunday school teacher. But the catechetical schools[1] which flourished in the post-apostolic Church were entirely different. Moreover, the regular catechizing of children, which was always the duty of the minister, albeit a duty very much neglected for many centuries, was not a precursor of the Sunday school. Indeed, if it had been thoroughly effective and well developed, there might never have been a Sunday school. The failure of the clergy thoroughly to systematize and to develop the religious education of the children made the Sunday school necessary. Thus the Scottish clergy, who were more successful in the training of children, regarded the new institution at first as altogether superfluous. The origin of the Sunday school is to be sought in the sporadic efforts of earnest men and women to supply some elementary instruction to children who were neglected by the Church. The most notable instance of such effort was that of Robert Raikes at Gloucester; the name 'Sunday school' seems first to have been attached to his

[1] See art. CATECHUMEN, CATECHUMENATE.

institution; and there was genetic connexion between Raikes's enterprise and the whole Sunday school movement that succeeded.

2. The period of beginnings.—(*a*) *Robert Raikes and the first Sunday schools.*—The national duty of universal education was not fully recognized in England until fifty years ago. In the 18th cent. education was the privilege of the well-to-do. Even the many benefactions which had been provided from time to time for the education of the poor had become almost universally devoted to the children of the middle classes. Moreover, with the development of the factory system, the children had been forced into labour at a very early age, with the result that they grew up in hopeless illiteracy. Among a number of efforts to remedy this intolerable condition the most significant was that of Robert Raikes, editor of the *Gloucester Journal*. He was a man of generous sympathies, interested in various efforts to ameliorate the lot of the unfortunate. His attention was attracted to the vicious conduct of the 'young pagans' who were employed in the factories during the week, but who were at large on Sunday, and who naturally employed their single holiday in the only rough recreation which they understood. Believing that their ignorance was responsible for their depravity, he gathered a number of them into a school and secured four women at one shilling per day to instruct them 'in reading and the Church Catechism.' The date of this simple enterprise, which was soon copied in numerous towns, is usually set at 1780. Sunday schools became so popular that attention was given to them in the *Gentleman's Magazine*, and the various letters in that once influential periodical still remain our most important source of information regarding the beginning of the movement. Wesley, in his itineracy, soon came upon Sunday schools in various places, and with fine insight immediately saw their possibilities.

(*b*) *The Sunday school in America.*—The American churches were accustomed to hold services in the morning and afternoon. There was an 'intermission' of an hour or more, during which a simple lunch was eaten. Naturally this period was often used for the catechetical instruction of the children, for whom the somewhat solemn services provided little that was appropriate. There is no evidence that any such practice was at all common previous to the Revolution. The catechizing of children took place in the schools, in the family, and in connexion with the pastoral visits of the minister. A large proportion of the children were of course altogether neglected. The period of the Revolutionary War was not favourable to religious education, and the strong influence of France tended decidedly away from religion. In the general desire of the churches to meet this condition, they turned with interest to the new institution of the Sunday school, which had been introduced into the United States from England. It was not in America primarily (though it was to some extent) a school held on Sunday for illiterate children who could not be instructed on weekdays, but rather a school conducted by the Church for religious instruction on the day set apart for that purpose. Thus from the beginning the Sunday school in America was more closely related to the Church than it was for a long time in England. This is not to say that there was not considerable opposition in the one country as in the other from clergymen who felt the danger of the intrusion of inexpert laymen.

(*c*) *Sunday school organizations.*—Within a few years of the establishment of the Raikes schools organizations for propagating the institution came into existence.

William Fox, a London merchant, had had in contemplation a large plan for the gratuitous instruction of the poor. When he learned of the Raikes scheme, it seemed to him more practical than his own more ambitious project; and he took the lead in forming, in 1785, the Society for the Establishment and Support of Sunday Schools. In 1796 was organized the Edinburgh Gratis Sabbath School Society. Others were formed in other Scottish cities. In 1810 the Hibernian Sunday School Society was organized in Dublin. These societies collected funds for the establishment of new schools, for the payment of teachers, for the purchase of Bibles, spelling-books, etc. The practice of paying teachers, although continued in a few places for many years, very soon gave way to the volunteer system, with the spread of the new institution. A number of young men who were giving their services in the Sunday schools of London felt the necessity of mutual help and conference, and organized in 1803 the Sunday School Society for this purpose. This organization became the most significant means of developing the Sunday school in Great Britain.

Organization began in America with the First-Day or Sunday School Society at Philadelphia, in 1791. It was undenominational in character and philanthropic in purpose. The visit of Albert May of London in 1811 greatly stimulated interest in Sunday school organizations. Many of them were formed in American cities. After a number of federations of these had been made, the desire for a national undenominational union resulted in the organization in 1824 of the American Sunday School Union, which has continued to do effective work to the present time.

(*d*) *Lessons and methods of teaching.*—The earliest Sunday school teaching was of the most primitive sort. Many schools on both sides of the Atlantic were obliged to give much of their time to the simplest lessons in reading and spelling. Religious instruction consisted of the memorizing of Scripture, hymns, and catechism, the teacher simply listening to the recitation. Soon some simple plans of lessons were prepared, with some practical appreciation of child religion. Helps to the teacher were the *Sunday School Repository, or Teachers' Magazine*, which began in London in 1813, and the *American Sunday School Magazine*, started in 1824.

3. **Development of the Sunday school in America.** — (*a*) *Denominational organizations.*— The definite adoption of the Sunday school by the Church in America is seen in the steps taken by almost all the denominations subsequent to the organization of the American Sunday School Union to supervise and extend the work within their own churches. For example, in 1827 the Sunday School Union of the Methodist Episcopal Church was organized in New York City; Baptist and Congregational organizations starting in 1825 developed into the American Baptist Publication Society in 1840, and into the Congregational Sabbath School and Publishing Society in 1868. The superior church bodies of other denominations undertook similar responsibilities.

(*b*) *The Sunday School as a pioneer religious agency.*—It is easy in the light of our modern educational science to criticize the poor endeavours of early religious education, but no history of the wonderful development of the Mississippi valley would be adequate which failed to recognize the social significance of the little Sunday schools that went far ahead of the organized Church into the pioneer communities.

In 1829 the American Sunday School Union established its first western headquarters at Cincinnati, and in the following year resolved at its annual convention to undertake the organization of a Sunday school in every destitute place in the Mississippi valley. Funds were raised, lay and clerical missionaries were appointed, and a notable advance was made. A single missionary in the course of a life of arduous journeying organized over 1300 new schools. As it was said of old that where ten Hebrews lived there should be a synagogue, so it came to be the expectation in America that, wherever three or four Christian families were neighbours, a Sunday school should be started, at first in the farm-house, later in the school-house or in the court-house. Very many churches of the West had their origin in the activities of a few of the laity who had begun religious work by the organization of a little Sunday school.

(*c*) *The International Sunday School Association.*—The convention system has been characteristic of the American movement. Neighbourhood conventions were held before 1820. Springing from the annual meeting of the American

Sunday School Union, a national convention of Sunday school workers was called in 1832. After a very successful session this body adjourned to meet the following year. Numerous state and county conventions met in the succeeding years, until in 1859 a third annual convention was called. The fourth did not meet until after the Civil War, in 1869, and by that time the noted Illinois leaders, B. F. Jacobs, Edward Eggleston, J. H. Vincent, and D. L. Moody were prominent. While this convention was not called international, there were delegates from Canada and from the British Isles. The same was true of the fifth convention of 1872, at which the uniform lessons were adopted. The movement then became definitely organized as international, with delegates from all the states and provinces of North America. An official body was gradually developed, which supervised the extension of the system to state, county, and township conventions, meeting annually and leading up to the great triennial gathering. At the eleventh convention in 1905 it was resolved to incorporate under the name 'International Sunday School Association.' This was done in 1907, headquarters being established at Chicago. A completely articulated organization exists under an executive committee, with a general secretary and a corps of superintendents over the various divisions and departments.

(*d*) *The development of the lesson system.*—As an improvement on mere memorizing, the 'limited lesson' system came into vogue about 1825. Two years later Albert Judson published a question-book, which supplied some notes and explanations of the selected lessons. In the same year the American Sunday School Union issued the *Union Question-Book*, which was followed annually by others covering a considerable portion of the Bible. Various schemes followed, the result partly of private enterprise, partly of denominational zeal. There was no adequate direction, and Sunday school leaders felt the need of some unity of effort. After much discussion the convention of 1872 voted to issue a uniform system of lessons for all Sunday school pupils. A lesson committee was appointed, and great enthusiasm was developed in the scheme. The co-operation of the British Sunday School Union was secured, and the lessons became practically universal. Noted writers prepared lesson-helps and commentaries; great teachers' meetings were held for the exposition of the lesson of the forthcoming Sunday, and the public press frequently devoted a column on Saturday to this purpose.

After twenty years of great external success the educational value of the uniform lesson was seriously called in question. The subject was warmly debated in conventions. At last, in 1908, the convention decided, while continuing the uniform lesson, to authorize its lesson committee to prepare a thoroughly graded course, to be used by such schools as desired it. This has since been done, and a series of text-books has been prepared by the various denominations upon the lessons thus outlined.

(*e*) *Teacher training.*—It has been recognized that most Sunday school teaching has been very unsatisfactory. Efforts have been made almost from the beginning to effect improvement. The institutes held since 1837 for public school teachers were a challenge to the Sunday school, which was answered by the development of conferences and institutes. The normal class of J. H. Vincent in Illinois in 1857 was a model which many followed. Courses for normal training of increasing scope have been issued, until to-day those published by the various denominational societies and prepared by educational experts are of very high grade. A summer school has been established at Lake Geneva, Wisconsin, where instruction for professional and lay workers is carried on during the vacation season.

(*f*) *The Sunday School Council of Evangelical Denominations.* — The activity of the various denominations in Sunday school work has very markedly developed during the last thirty years, until there has grown up a professional body of editors and secretaries representing the more definitely Church point of view. These leaders, feeling the need of a common expression of the denominational responsibility for religious education, organized in 1910 the Sunday School Council of Evangelical Denominations. Annual meetings are held, at which important problems of educational policy and administration are discussed. The existence of such a representative body naturally raised the question of future responsibility for the making of the lessons for the Sunday school world. The lesson committee has therefore been reconstituted, and now consists of eight members selected from the international association, eight members selected by the council, and one member selected by each denomination having a lesson committee.

(*g*) *The emphasis on religious education.*—The last quarter of a century has been marked by a growing emphasis upon the more serious educational responsibility of the Church. This was seen in the demand for the graded curriculum. In addition to the international lessons, several very significant courses of study have been produced, notably the *Constructive Studies* of the University of Chicago Press, the *Completely Graded Series* of Scribner, and several series of various denominations. In 1903 was organized the Religious Education Association to promote the educational ideal in religion and the religious ideal in education. The Association holds annual conventions or conferences, conducts studies and surveys, publishes a magazine, gathers in its offices in Chicago all significant material on religious education, and conducts an extensive correspondence of advice and stimulus on problems in this field. Several denominations have established Boards of Religious Education, which are undertaking the supervision of the entire educational work of the Church. Leaders of great ability are being selected as secretaries. In some cases these boards are preparing new and specially graded curricula.

The numerous agencies of religious education are being co-ordinated in the more progressive churches under a professional director of religious education. He is becoming the educational minister of the Church. Some colleges and universities and most theological seminaries have established chairs of religious education, by means of which a trained professional force is being developed and scientific work in religious education is being undertaken. An extensive literature has already been produced, both technical and popular.

4. **British developments.**—(*a*) *The Sunday School Union.*—The parent society in London developed into a nation-wide enterprise. In 1821 there were four metropolitan auxiliaries and sixty provincial unions, besides the Sunday School Society of Ireland and the Sabbath School Union of Scotland. The reports of that year show 4000 schools with 36,000 teachers, and 500,000 scholars. In 1823 infant schools were added for children below the ordinary Sunday school age, as in 1811 Thomas Charles of Bala, the Welsh Methodist leader, had already established adult schools. The latter subsequently became known as senior classes, and in time both infant and senior branches became part of a completely organized school. The Union celebrated its jubilee in 1853 by inaugurating a fund for the erection of

a permanent building. In 1862, at the time of the International Exhibition in London, a general Sunday school convention was held, attended by delegates from all over the British Isles, as well as from the Continent, the United States, and the Colonies. British Sunday schools were accustomed to meet in the morning and in the afternoon, and the Union had prepared annually a double series of lessons. Beginning with 1874, the British Lessons Committee co-operated with the American Committee in the production of the international series of lessons.

In 1880 was celebrated the centenary of Sunday schools throughout the United Kingdom, and a great convention was held in London to which delegates came from all over the world. As a result of this enlarged interest, the Union modified its constitution so as to become thoroughly national in character, representation to the counties being extended in 1890.

During the last thirty years the Union has developed a very significant philanthropic work, including country homes for poor scholars, a home of rest for lady teachers, a children's convalescent home, etc.

(*b*) *Educational progress.*—In the second quarter of the 19th cent. a forward movement in the science and art of pedagogy began in Scotland. David Stow organized the Glasgow Normal School for the training of teachers. Believing that the same principles could be applied to religious education, he published in 1826 a training system. The Union published in 1837 *Popular Education, or a Normal School Manual.* In 1856 a training class was organized at Pimlico. An attempt was made in 1861 to establish a college for Sunday school teachers, but it was found more feasible to develop a system of standardizing examinations. The college was finally established in 1899, and the examination system adapted to this organization. In addition to the publication of lessons and the encouragement of teacher training, the Union has developed a considerable literature for teachers and scholars, a separate building being required for this phase of its work.

5. World Sunday school work.—The Sunday school spread naturally through the English-speaking world. Various efforts were made, beginning as early as 1815, to establish it on the Continent, but with slight success. The convention in London in 1862, at the earnest solicitation of Albert Woodruff, undertook a continental propaganda. Sunday schools were established in all European countries. This movement was promoted by the world's conventions which met in London in 1889, in St. Louis in 1893, in London in 1898, in Jerusalem in 1904, in Rome in 1907, in Washington in 1910, in Zürich in 1913. At Rome the World Sunday School Association was organized, with American and British sections. Missionary work in China, India, S. Africa, and Europe was assigned to the British section; in Japan, Korea, the Philippines, S. America, and in the Muslim fields to the American section. The Association reported at Zürich the world Sunday school membership as 30,015,037, with 310,057 schools, and 2,669,630 officers and teachers.

6. Non-Protestant Sunday schools.—The Roman Catholic Church has adapted the Sunday school to its system, though without relinquishing the control to lay leadership. In the Hebrew Reformed Synagogue the Sunday school, generally under paid teachers, has become very effective. Among the Latter-Day Saints an excellent system of religious education has been developed, including the Sunday school. The Christian Science churches have established Sunday schools especially for children.

THEODORE GERALD SOARES.

SUNNITES.—1. Distribution. — Islām is at present divided into two great unevenly divided sections. The Shī'ahs (*q.v.*) are found in Persia and among the masses in India; the Sunnites in the Turkish empire as it was prior to the Great War, in N. Africa, Egypt, other parts of Africa, Central Asia, Afghanistan, India, China, and the East Indies. In India the ruling class is of Sunnite faith; in the Turkish empire there are numbers of Shī'ahs of the better class who make a point of concealing their religious convictions. The Muhammadan population of the world is estimated to be about 221,000,000, and of this total it is reckoned that about 15,000,000 are Shī'ahs; the rest are Sunnīs. The Ibādīs (*q.v.*) of E. Arabia and N. and E. Africa are not relatively numerous and are neither Shī'ah nor Sunnite inasmuch as they claim descent from the Khārijite[1] schism of the early Umayyad period. The Zaidites (*q.v.*) of Yemen, though of Shī'ah origin, are on terms of fellowship with the Sunnites of Arabia.

2. The term 'Sunnite' and the early attitude towards the sunnah.—The Sunnite is the follower of the *sunnah* ('form,' 'outline,' 'mode,' 'usage'), or the view and usage of the Prophet. The issue implied in the use of the term is as to how new demands of thought are to be satisfied and new situations are to be met. The party of the *sunnah* contended that, where the Qur'ān did not fully and clearly provide direction, the inquirer should seek trustworthy information as to what Muhammad had said on the subject, what his action had been with relation to it, or what he had approved in others. The *sunnah* of the Prophet would be found embodied in a tradition (*ḥadīth*), and it was of the highest importance that the trustworthiness of traditions should be certified. They were tested, not by their intrinsic probability or by their consistency with other reports, but solely by the reputed reliability of the succession of persons through whom they had been handed down. If the *'isnād*, or chain of guarantors, had no unreliable members, the contents of a tradition were considered to furnish unimpeachable support for the opinion or course of action on behalf of which they had been cited. This mode of arriving at the *sunnah* of the Prophet opened the way to the wholesale fabrication and perversion of traditions to suit the needs of persons hard pressed for arguments on behalf of causes honest or dishonest. Abū Ḥanīfah († 150 A.H.) seems to have felt that tradition as a basis of support was not sufficient. Possibly, as a Persian he lacked the Arab's respect for this mode of proof and sought a more rational method, but what determined his attitude to an

[1] See art. KHAWĀRIJ.

even greater degree was probably the notoriously untrustworthy manner in which traditions were produced. He preferred to resort directly to the Qur'ān and, where it was not explicit, to decide according to his own view of what might fairly be inferred from its teaching as bearing on the question in hand. This method of obtaining direction involved two principles which the party of the *sunnah* for a long time viewed with distrust, viz. *ra'y*, or independent personal judgment, and *qiyās*, argument from the analogy of known cases to secure direction for new cases. Both of these were thought to imply disrespect towards inspired authority. Abū Ḥanīfah went farther than this in the readiness which he showed to depart from the written authority of the Qur'ān and the direction given by the *sunnah*. Even when these gave a clear decision, or where the principle of *qiyās* gave a definite instruction, the situation might suggest a better view or a wiser course of action. To follow such a suggestion was a duty. The principle here implied is termed *istiḥsān*, preference, or asking for the better thing. It involves personal independent judgment (*ra'y*) to a greater degree than the employment of *qiyās* does and is still more inconsistent with the early view of the party of the *sunnah* ('Ahlu-'s-Sunnah). Mālik ibn 'Anas († 179 A.H.) lived in the atmosphere of tradition at Medīna, and tradition had more weight with him than with Abū Ḥanīfah. Still, where traditions were being forged at the rate he knew and for the purposes of which he was aware, there was room for a principle of decision in legal and doctrinal questions which would protect Islām against injury through capricious or irrational judgments. Mālik, therefore, admitted the rule of *istiṣlāḥ*, the seeking of the public welfare, which might override the dictation of the Sacred Book and the *sunnah*. The strict party of the *sunnah* opposed this rule, as it had the liberal practice of Abū Ḥanīfah; both allowed too much room to *ra'y*. To men accustomed to earlier conditions, when the absence of a *sunnah* which might cover all cases left room for decision on other grounds, the mere multiplying of traditions did not afford a sufficient reason for surrendering methods of obtaining guidance which had been followed when traditions were not available. Meanwhile the uninformed masses of Islām were strongly inclined to the simpler method of appeal to external authority. *Qiyās*, *istiḥsān*, *istiṣlāḥ*, and *ra'y* were too human, and hence too feeble and erring. The future of Islām largely depended on whether free scholarship (*ra'y*) or authority (*sunnah*) became the ruling factor in the community, whether the need of the Muslims was to be conceived according to the view of intelligent leaders or to that of the great body of the people with its clinging to old-established ways.

3. The Mu'tazilite reaction.—The traditional and rationalistic tendencies both went on developing, and the mutual antagonism between them was intensified. The rationalistic party became recognized as a party which favoured *ra'y*, lent its approval to Greek philosophy and Christian culture, and regularly employed the Aristotelian method of arriving at truth. The earlier *khalīfahs* of the Abbāsid dynasty had been interested in these things, but they became established and officially approved under the *khalīfah* al-Ma'mūn († 218 A.H.). In the last year of his reign he instituted an inquisition against the traditionalists. This inquisition (*al-Miḥna*) went on for sixteen years (218–234 A.H.), and, while it lasted, the orthodox suffered severely and their leaders were often under peril of death. This period of persecution, with the strenuous controversies which it witnessed, settled the characteristic marks of the later Sunnī belief and also brought out and sharpened the weapons by which rationalism sought to destroy the positions of the 'Ahlu-'s-Sunnah. The latter applied to their opponents the name Mu'tazilah, 'dissenters' or 'seceders.' It was a name which had been used in a favourable sense of pious ascetics or hermits, but in the late 2nd cent. A.H. it was given an unfavourable significance and came to mean heretics. On the one side were the 'Ahlu-'s-Sunnah, and opposed to them were the 'Ahlu-'r-Ra'y, the Mu'tazilah. The fundamental question for both parties was the true conception of God. Was the view held by the one party or the other a view which did justice to the unity of the Supreme Being? Was it one which adequately set forth and protected His character as a perfect Being? The Mu'tazilah, as their orthodox antagonists called them, were proud to describe themselves as the 'party of the (divine) unity and justice' ('Ahlu-'t-Tawḥīd wa'l-'adl). They charged the party of the *sunnah* with a contradiction of both these divine virtues.

Connected with these fundamental issues were others of sufficiently vital importance but subordinate to them. The question as to the source of authority for belief and conduct required to be solved. The party of the Qur'ān and *sunnah* insisted upon a literal conformity to these two sources, while the Mu'tazilah demanded that belief and conduct should be consistent with reason, and the method by which the rational view was to be tested was that of the Aristotelian logic. This science was known by the term *kalām* (*q.v.*), and those who relied upon it were designated Mutakallimūn — descriptions without intrinsic stigma, but acquiring in the hands of the orthodox Sunnites the unpleasant implication of heresy and heretics respectively. The Mu'tazilah nevertheless were proud to call themselves 'Ahlu-'l-'Aql, 'the party of reason,' and felt that only by reason could one reach a worthy view of God and of man's duty to Him. The Qur'ān was saved from absurd interpretations and became a real guide for reasonable beings only as it was subjected to a rational process of study. Literal acceptance of the text had led the orthodox to proclaim the dogma of the uncreated and eternal nature of the Qur'ān, and as a party in this early time they applied the dogma even to the letters and words of the book as written and to the sounds of the uttered recitation or reading. It was in the controversy regarding the uncreated nature of the Qur'ān that Aḥmad ibn Ḥanbal (*q.v.*) appeared as the outstanding champion of the traditional view. When pressed by the Mu'tazilite argument to the effect that the human media and the inanimate records were obviously not unlimited in either nature or duration, his answer was that the book declared itself to be (or, rather, God in the book declared it to be) *kalām Allāh*, *i.e.* the word or speech of God, which was inseparably and uninterruptedly an attribute (*ṣifa*) of God. It could not be dissociated from the thought of God and the divine reason and was therefore eternal. This polemic instantly raised the question of the divine attributes (*ṣifāt*). Was the *kalām Allāh* to be conceived as an entity independent as to essence from the being or essence of God? Were all the attributes entities in this sense? On the basis of the statements of the Qur'ān the party of the *sunnah* persistently argued for the affirmative. The Mu'tazilah charged them with giving God a partner (*shirk*). It was polytheism to assert that there were other eternal entities beside God. The Qur'ān text should not be interpreted in such a sense as to violate the unity of God and 'associate' other beings with Him. It should be explained in an allegorical sense (*ta'wīl*) where the literal sense would involve irreverence or what was irrational. The orthodox rejoinder relentlessly attacked the presumptuous setting up of *ra'y* over the *kalām Allāh*. It surely was the greater sin that the creature should venture to set aside the plain words which God had spoken because to him they seemed absurd. The ambiguity of the terms used in the controversy made agreement between the two parties impossible. 'Word of God' meant one thing for Aḥmad ibn Ḥanbal and a very different thing for his persecuting inquisitors. For him to claim that his Qur'ān was uncreated, and for them to reply that their Qur'ān was created, must necessarily have left each where he was before the argument. The *sunnah* party suffered much ridicule at the hands of their opponents because of their readiness to accept all the anthropomorphisms of the Qur'ān as precise descriptions of fact. They boldly taught that God sat on a throne, possessed sight, smell, hearing, etc., though they grew more cautious as the controversy wore on and pressed for verbal acceptance of the Qur'ān teachings, with a consent to leave questions as to how such things could be with God Himself to make plain later or not to make plain as He chose. It was to be an acceptance 'without seeing how' (*bilā kayfa*, or, contracted, *balkayfa*). Connected with this subject of the anthropomorphic attributes and acts of God in the Qur'ān is that of the possibility of actually seeing God, as the Qur'ān declares. If the saints see God, it is implied that the anthropomorphic view is literally true; if it is not true, they do not see Him.

One more element in the Mu'tazilite controversy

remains to be noticed. The party of the *sunnah* held the characteristic Arab view that the will of Allāh was the all-determining source of change and activity in the world. The 'party of *'aql*' allowed to man the capacity to initiate action and placed upon him the responsibility for his choice. Because of their attitude on this special point, the Mu'tazilah are classed as Qadarites (believers in free will). Their argument attacked the orthodox, particularly on the ground that they held man responsible for his acts and nevertheless denied that he was free. Freedom he might seem to have, but it was only illusory; in reality his acts were created by God, without whom nothing happened. This orthodox contention the Mu'tazilah repudiated as involving injustice to man and also as implying an insulting impeachment of God's justice.

4. Re-establishment of orthodoxy.—The Mu'tazilite controversy was summarily terminated by the *khalīfah* al-Mutawakkil in 234 A.H. He reversed the liberal policy of his predecessors, declared the doctrines that they had championed to be offences against the State, and proclaimed the orthodox views to represent the official opinions which alone would be tolerated in Islām. This official endorsement of the 'Ahlu-'s-Sunnah has been maintained in Islām down to the present. The dogmatic beliefs of the persecuted orthodox are held by both Sunnites and Shī'ahs, and the Sunnī khalīfate has regularly stood sponsor for them. There is no doubt that the Mu'tazilite *khalīfahs* of the Miḥna period represented a relatively small minority in the Muslim world of their time and that al-Mutawakkil was wise not to continue his support of their views in the face of an adverse popular sentiment. Tradition and Qur'ān retained their hold upon the masses, to whom their directness and their clear mandatory accent appealed as mere reflective opinion could hardly hope to do. The great body of Islām ranged itself behind the orthodox *khalīfahs*, and the Mu'tazilah tend to disappear little by little. The free-thinking teachers notwithstanding give the traditional theologians a great deal of trouble, in spite of the smallness of their numbers. It was easy to make a system based on literal interpretations appear ridiculous when attacked by means of keen dialectic, and the orthodox tenacity and insistence did not prevent their partisans from feeling an awkward discomfort when they were forced to evade rather than answer the attacks made upon them. It will be readily understood that the man who enabled them to inflict genuine defeat upon their opponents, Abū'l-Ḥasan al-Ash'arī (*q.v.*), would seem to the orthodox to be almost a prophet when he arrived.

5. Abū'l-Ḥasan al-Ash'arī.—Al-Ash'arī had been long trained in the views and arguments of the Mutakallims, and there is some plausibility in the legend which represents him as using their method against his own teacher al-Jubbā'ī to the discomfiture of the latter. He had apparently come to see that the Aristotelian logic was valuable, not for the discovery of truth, but for making explicit the significance of propositions which were taken for granted and for the confutation of false arguments. It became clear to him that religion could not be built securely upon *kalām*, a formal science. The foundation must be in revelation through inspired men and media, through prophets and sacred writings. Feeling that, in spite of their poor logic, the party of the *sunnah* had founded Islām upon the true basis, that tradition was a genuinely trustworthy means of communicating revealed guidance from age to age, and that the consensus of the Muslim community (*ijmā'*) expressed through its leaders was more reliable than the judgment of the individual Mutakallim, al-Ash'arī returned to the orthodox faith which he seems to have inherited from his forbears in the first instance. He came back converted through his own employment of *kalām* against itself, and naturally he made use of the weapon from that time (300 A.H.) forward to disprove the views of the Mu'tazilah and to develop into a system the orthodox doctrine.

6. The principle of consensus.—The principle of consensus operated more largely from the days of al-Ash'arī onward. It was Ash-Shafi'ī (†204 A.H.) who first made extensive use of it in his teaching and was prepared to accept it as a guide where the Qur'ān and *sunnah* failed to afford direction. His preference for *ijmā'* was approved only with reserve by the rigid Ḥanbalite orthodoxy of the 3rd century. Al-Bukhārī's strictness in the criticism of *ḥadīths* and his refusal to give an opinion on the human utterance of the Qur'ān are possibly alike based upon an employment of the *ijmā'*. The principle has a bearing upon the division of Islām into Sunnites and Shī'ahs. In the days of the early Ash'arite school this division, which is based, not upon dogmatic differences of a genuine religious character, but upon a divergent view of the khalīfate, had not yet taken place, and the *ijmā'* embraced the whole Muslim community. When the division came, it was recognized that the 'Ahlu-'s-Sunnah lay beyond the boundaries of the Persian empire as organized under the Ṣafawids (A.D. 1502), and that *ijmā'* had a sense and a binding force in Sunnite Islām which it did not have in Persia. The Persian Muslims readily accord the name Sunnīs to their rivals and accept Shī'ah as a proper term by which to describe themselves. *Ijmā'* is especially a Sunnite principle and has guided the leading movements and changes of Sunnite Islām during many centuries. There is no need of its use among the Shī'ahs, where appeal is made to the inspired authority of the *imāms* as it is voiced through their *mujtahids*.

In spite of the fact that the Ḥanbalite school, so powerful in the 3rd cent. of Islām, is now almost a negligible quantity, al-Ash'arī, the founder of the Sunnite theological system, was an ardent Ḥanbalite after his conversion and died in that faith (320 A.H.). It is necessary to say, however, that the views which are now held by all the Sunnite schools are the founder's views as somewhat liberalized by the Ash'arite school after his death. There is evidence to show that the cast-iron system into which the great teacher came back at the time of his conversion from Mu'tazilism was modified through the very *kalām* influence which he brought with him. It was probably al-Ash'arī's thought to employ *kalām* for purely apologetic purposes, but his followers gave much more scope to the principle of the consensus than he seems to have thought of. The 'Six Correct Books' of traditions (*Kutubu Sittah*), of which the two great *Ṣaḥīḥs* of al-Bukhārī and Muslim are the most essential authorities, contain the only generally accepted evidence as to the *sunnah*, but in the application of the *sunnah* the principle of the *ijmā'*, used in accordance with the scholastic method introduced by al-Ash'arī, has made it possible to leave far behind the strict views of law held by the triumphant Ḥanbalite school of the 3rd Muslim century. That kind of unchanging orthodoxy would not have preserved the unity of Islām as it has been preserved among the Sunnites. Modern Ḥanbalites are the consistent successors of the early Ḥanbalite school before al-Ash'arī, but they exert little influence. Sunnite Islām is an Islām to which the liberal views of the Ḥanafites and the moderate views of the Mālikites and Shāfi'ites have had less and less difficulty in adjusting themselves as time has passed, so that in opinion and practice unity and even a large measure of uniformity have come to prevail. The Ḥanbalite domination of the Sunnī sect became at once impossible with the admission of the *kalām* method and the broader understanding of the *ijmā'*. The schools differ, as they have always differed, in the extent to which they recognize certain liberal principles and attitudes of mind. Analogy (*qiyās*) and judgment according to personal opinion (*ra'y*, and, in special relations, *istiḥsān*, or preference for a better view) play a large part in the administration of Ḥanafite law, a less important part among the N. African Mālikites, and a small part in the Shāfi'ite communities of Islām. But the difference is within the region of *fiqh* and not within that of dogmatic opinion.

7. Triumph of Ash'arite theology.—The process of liberalizing the orthodox system of al-Ash'arī must have been somewhat rapid in the century

following his death. Towards the end of the 4th cent. A.H. there seems to have been a disposition to allow *kalām* to run riot in Baghdād, where we read of theologians who were willing to argue questions without reference to the traditional authorities of Islām. Even in the West the great thinkers, excluding Ibn Ḥazm (*q.v.*) as almost a sole exception, gave themselves more and more to a philosophical account of religion and at the same time realized painfully that they had parted company with accepted orthodox views. Men like Ibn Ṭufail and Averroës (*qq.v.*) in the late 6th cent. A.H. have one system for the masses and another teaching for the instructed few. Nevertheless one may say that, in spite of excesses, the Ash'arite school had definitely imposed its views and method upon the Muslim world before the end of the 11th cent. of our Christian era. The liberty of thought which al-Ash'arī had secured for Islām had developed by that time a controversial intellectualism which left no place for intuition or mysticism in religion, and orthodoxy was in serious danger of losing the sympathy of the masses. A new emphasis was called for in order to supply a corrective to the general rationalism which prevailed.

8. Al-Ghazālī.[1]—Al-Ghazālī († 505 A.H.) was by nature an intensely religious man to whom the truth was the greatest of all possessions. It was for him life's supreme concern to solve the problem of Ultimate Reality in such a way as to be satisfied that he enjoyed contact, response, and fellowship with it. He was convinced that what he sought could not be given by an acceptance of truth on mere external authority, a point to which, in spite of his dependence upon *kalām*, al-Ash'arī still held. He saw that the Mutakallims could proceed to their conclusions only as they took for granted certain propositions which they did not prove, and that, when they had said all, the seeker had in possession only a system of logical inferences and not at all an experience of the ultimately real. Not because it was a last resort or because he was in despair of finding anything better, al-Ghazālī turned to Ṣūfism. He made a full and sympathetic trial of the Ṣūfī discipline, after having tried other ways, and was convinced that the Ṣūfīs (*q.v.*) had solved the problem of the soul's quest. Man craved a satisfying revelation and a satisfying communion with God; he received both through faithful conformity to the Ṣūfī ideal and persistent openness to receive higher communications. Al-Ghazālī was a moderate Ṣūfī who was ready to give due weight to reason within its own limits, and who recognized the ethical and religious duties of the common life. His pre-eminent gifts and virtues—for he was one of the finest characters as well as one of the greatest minds which Islām has produced—have made his solution of the religious problem exceedingly influential down to our own day. Ṣūfism became a power far beyond the borders of the dervish organizations; the extreme dependence upon rationalism was checked; the emotional factors in human nature were provided for with due regard to ethical and religious conduct. Probably no teacher since the days of the Prophet has afforded to Muslims a better illustration of the possibilities of their own faith. Sunnites generally admit a great indebtedness to him, and his works are standard texts in the training of orthodox theologians (*'ulamā*).

9. Sunnites and Shī'ahs.—The distinction between Shī'ahs and Sunnīs has its roots in the dispute between the 'Alids and Umayyads in the years which followed the *khalīfah* 'Uthmān's assassination (35 A.H.). In its origin it has nothing to do with the religion founded by Muhammad, but rather is occupied with the political question of the succession to the leadership of the Muslim community. At first the 'Alids on their side claimed that they were the legitimate *khalīfahs* because they were descended from the Prophet's daughter Fāṭimah and his cousin and intimate companion, 'Alī. The Umayyads on their part claimed a nomination by the choice of the Muslims themselves and as a further title claimed kinship with the Prophet as being of the Hāshimite family. Later the 'Alids stood for the claims of descent against all claims of right to office because of the popular choice. This difference still marks off the Shī'ah political theory from that held among the Sunnites.

(*a*) *Theory of the khalīfate.*—There is, moreover, an old standing difference between the Sunnites and Shī'ahs as to the functions of the *khalīfah*. Among the Sunnites the *khalīfah* is a political ruler essentially, while from the first the 'Alid party regarded the Prophet's successor as a religious guide and therefore preferred to designate him as the *imām* of the Muslim community. It was assumed that his physical descent from the Prophet secured to him not merely divine rights, but also a divine endowment of grace and wisdom. No such assumption was held by the Sunnites with relation to their *khalīfahs*. They were chosen from among the believers and could claim no supernatural qualifications. Their authority was conferred by the Muslim community and carried with it no implication of pre-eminent saintliness or infallibility. The Sunnite attitude towards the *khalīfahs* differs greatly from that of the Shī'ahs towards the *imāms*. The personal qualities and public influence of the *khalīfahs* have been largely determinative of the respect shown to them. Among the Shī'ahs the office hallows the occupant, and the *imāms* are regarded with the deepest religious veneration. The Sunnite *khalīfahs* by law are required to be of the Prophet's tribe, the Quraish; the *imāms* were chosen from the still more narrow circle of the Prophet's immediate family.

Since the twelfth *imām*, Muhammad ibn al-Ḥasan, disappeared in the middle of the 3rd cent. A.H., the line of visible *imāms* has been suspended, but there has never been a legal reason why the Sunni khalīfate should be interrupted, as it has always been possible for the Muslim community to find an eligible candidate and to nominate him, provided circumstances did not interpose a physical hindrance. The *sulṭāns* of Turkey have assumed to be the *khalīfahs* of the Prophet and have taken to themselves the exclusive title pertaining to that office, Emir al-Mu'minīna, 'Commander of the Faithful,' since the time of the Ottoman conquest of Egypt in A.D. 1512. As they are not of Arab race, let alone of Quraishite lineage, there is no basis in law for the Ottoman claim. The first *sulṭān* (Selīm I.) to assume the title justified his act on the ground of a surrender of his rights on the part of the last 'Abbāsid *khalīfah*, al-Mutawakkil II., who at the time of the conquest of Egypt was attached to the court of the Mamluk *sulṭāns* and was recognized by them as the spiritual head of Islām. The Ottoman *sulṭāns* have retained in their own persons the dual authority temporal and spiritual which the Mamluks had divided, and the principle of the consensus seems to have permitted the *'ulamā* to legalize the departure from the law of the khalīfate as settled by the *sunnah*. They have accepted the transfer of the 'Abbāsid rights to Sulṭān Selīm as giving a title, and have regarded it as fortified by other considerations, viz. the Ottoman conquest of Muslim domain, the control of the sacred cities, and the possession of relics of the Prophet. The *sulṭān* has made a concession to traditional sentiment in constituting the chief *muftī* in Constantinople as *shaikh ul-Islām*, or highest spiritual authority over all believers. This functionary, nevertheless, derives his power from the *sulṭān* who appoints him, though it is to be admitted that the choice of the *'ulamā* practically settles the appointment. All questions affecting Islām are considered by the *shaikh ul-Islām*, and are subject to his decision as promulgated by a *fatwā* issuing from him. The other conditions recognized by Sunnite authorities as binding in the election of a *khalīfah* are that he shall be of adult years, of sane mind, of free condition, a man versed in the learning of Islām, and a capable administrator who will rule justly. In contrast to the Shī'ahs, the Sunnī doctors have always recognized Abū Bakr, 'Umar, and 'Uthmān, the first successors of the Prophet, as genuine *khalīfahs* (*al-Khulafā ar-rāshidūn*) together with the fourth *khalīfah* 'Alī, who of course is allowed to be a legiti-

[1] Cf art. Ethics and Morality (Muslim), § 7.

mate successor by the Shī'ah sect also. For 'Alī and his successors in the imāmate the Sunnīs have much respect on account of their reputation for either piety or learning, though they do not admit the Shī'ah claim of supernatural gifts or divine rights as belonging to them.

(*b*) *Enmity between Sunnites and Shī'ahs.*—The intense hatred between Sunnīs and Shī'ahs as distinct sects dates from the time when the Shī'ahs were constituted a separate political organization by the foundation of the Ṣafawid empire of Persia in A.D. 1502. The fault in this mutual bitter feeling is greater on the Shī'ah side than on that of the Sunnites, but the treatment of Persian pilgrims to Mecca has been an enduring irritation, and in earlier times the military aggression of the Turkish *sulṭāns* gave occasion for resentment in Persia. As has been pointed out above, there are many individual Muslims of Shī'ah connexion in the Turkish empire, and, either because of an acquired indifference or oftener because of their practice of *taqīyah* (concealment of faith), they suffer no personal inconvenience at the hands of their Sunnite neighbours. The proposal of Nādir Shah in the 18th cent., that a reunion of Islām be brought about by admitting the Shī'ahs to fellowship with the Sunnīs as a fifth orthodox school, was prompted by the world-ambition of that ruler and was met by vigorous and successful opposition on the part of the Persian *mujtahids* and *mullahs*.

(*c*) *Position as to the sunnah.*—The difference between the Sunnites and the Shī'ahs does not consist in the acknowledgment of the *sunnah* of the Prophet by the former and its denial by the latter. The title of the Sunnīs to have the oldest and the most thoroughly tested body of traditions is not questioned, but the Shī'ahs also have their *sunnah*, whose authorities are the acknowledged *ḥadīth* collections of the sect. Resting upon these recognized standards, the Shī'ah teachers claim that they alone have the genuine *sunnah*, while the Sunnite version, they allege, has been perverted so as to furnish arguments against the claims of 'Alī and his sons to the succession of the Prophet. The corruption of the *sunnah* for any such purpose by the Sunnites is exceedingly unlikely, while the evidence of the manipulation of traditions by the Shī'ahs to support their own side is considered to be fairly clear. In the interpretation and adaptation of the *sunnah* to new relations the Sunnites are guided by the consensus (*ijmā'*) and analogy (*qiyās*), while the Shī'ahs claim to be alone rightly guided in their following of the *sunnah*, inasmuch as they have enjoyed the infallible instruction of the *imāms* either in person or since the line has been suspended by the inerrant communication of their word and will through the *mujtahids*. According to the *sunnah* view, there can be no *mujtahids* in Islām since the death of the last great orthodox founder in the 3rd cent. A.H. The term as employed in Sunnī circles is limited to the great *imāms* of the earlier centuries who founded the four orthodox schools and laid on indisputable foundations the theology and law of Islām. Since their day no teacher's opinions have justified themselves as a permanent basis for faith and life.

10. Changes in Sunnite Islām. — In theory Sunnite Islām is tied up to the Ash'arite system, and because of that it is thought to be fated to intellectual stagnation. The facts show that from the time of al-Ash'arī himself there was some modification of the founder's positions, and with the contribution made by al-Ghazālī one may say that the modification amounts to a materially altered view-point and the introduction of a new and revolutionary emphasis which laid stress upon intuitive and emotional factors in religious experience. The necessities of the historical situation have repeatedly rendered nugatory the theoretical requirements of Sunnite orthodoxy. Where Muslims live under Christian governments, as in India, the law of the khalīfate has to yield place to the obligations of political loyalty, the duty imposed by the *jihād* is in most cases unfulfilled, and the *zakāt* must be modified, especially as to the authority to whom it is to be turned over and the mode and purpose of its distribution. With the universal recognition of saint-worship and the cult of relics, the dogma of the unity of God and the law against idolatry (*shirk*) are violated, and the sufficiency of the canonical authorities, the Qur'ān and *sunnah*, is called in question. It may be recalled that one fruit of the modern liberal movement in India is the rise of the Aḥmadīyah sect, whose founder, Mirza Ghulam Aḥmad († 1908), recognized the logic of facts in the position of the Indian Muslims and declared that the duty of the *jihād* was not binding any longer. The practical effect of the Ṣūfī teaching when fully developed is a pantheism which is in contradiction with the hard, clear-cut monotheism of the Ash'arite theology. It is a pantheism leading to a loosening of the positive bonds of conduct which the orthodox teaching imposes. The righteousness of the Ṣūfī may become extravagantly mechanical and violently anti-social, so much so that public regulation may be called for, as is the case in Egypt. Enough has been said to show that Sunnite Islām, however immobile it may be in theory, has admitted into its system under the compulsion of facts vastly important modifications, some of which have seemed to contain unrevealed potentialities of disintegration.

11. Detailed differences between Sunnites and Shī'ahs.—A few points in which Sunnites and Shī'ahs differ require to be mentioned.

(*a*) The Sunnites do not accord to 'Alī and his sons the degree of veneration which the feast of Muḥarram implies. This holds true even if the Sunnite Muslims of India do not scruple to participate in the ceremonies of the feast along with their Shī'ah neighbours. (*b*) There is some confusion of the orthodox feast of the 'Ashūra, which falls on the tenth day of Muḥarram, with the Shī'ah feast, which extends from the first to the tenth day of that month. The motive of the respective feasts is, however, entirely different. The 'Ashūra commemorates the completion of creation by the creating of Adam and Eve on the tenth day of Muḥarram, while the tenth day of the Shī'ah ceremonies is simply the crowning day of the whole Muḥarram feast, pointing in particular to the Kerbelā massacre which is supposed to have taken place on that day. (*c*) Generally speaking, the ritual of ordinary worship differs only in the non-essential points. The mode of purification before the *ṣalāt* with the Sunnites includes the washing of the arm upwards to the elbow, while with the Shī'ahs the process is reversed. In the washing of the feet the Sunnite ritual literally washes; the Shī'ah merely rubs or wipes the feet. (*d*) To perform the *ḥājj* by proxy is not permitted by the Sunnīs, while it is not uncommon among their rivals. This permission, if granted, would violate the cardinal Sunnī requirement that a Muslim must perform the *ḥājj* at least once during his lifetime. (*e*) More far-reaching in its social effects is the permission given by the Shī'ah law to contract *mu'ta* marriages. These temporary unions, for a price agreed upon and under conditions of legal contract, are forbidden by the Sunnite codes. (*f*) The Sunnite recognition of the principle of *taqīyah* is limited to cases of extreme personal danger when it is at most permitted to dissemble one's religious convictions in order to preserve one's life. The Shī'ahs do not view *taqīyah* as limited to situations of personal risk, and, where it applies, they do not merely permit a resort to *taqīyah*, but strongly recommend the employment of it. Especially where the interests of religion may be supposed to be in jeopardy, the Muslim of Shī'ah faith will feel the use of *taqīyah* to be a moral obligation.

In all that has been said in the foregoing description of the Sunnite position and practice regard has been had to only those matters which fall within the canon law (*sharī'ah*). It must be kept in mind that in all Muslim countries, whether Sunnite or Shī'ite, there is another authority which has its constituted rights and its organized administration, viz. the customary law (*'urf* or *'adah*). This differs according to the established conventions of different places. It is not a distinctive feature of the Sunnites and need not be more fully treated in this article.

The power of the *'ulamā* among the Sunnīs is

very great, though as a class they are not viewed with the superstitious veneration or even fear which the Persian Shī'ah shows to many of the *mullahs*, to all the *mujtahids*, and to the large class of *sayyids* who are to be found in Shī'ite regions. The influence of the *'ulamā* has been conserved by their learning, which, though narrowly restricted to Muslim theology and law, is often comprehensive within those limits. This learning is constantly on call in the service of the Muslim community. Their influence, moreover, has been much greater than it might have been owing to a certain measure of accommodation which has made large room for such a phenomenon as the Ṣūfī movement—a movement whose elements of wonder and emotionalism have proved to the satisfaction of the masses that Islām was still a medium of supernatural power and divine life. Along with this they have admitted to the curriculum of theological studies in all the leading schools the works of the great mystics, particularly those of the master, al-Ghazālī. The tacit or explicit approval of the cult of saints, endowed as it is by public funds, may be an anomaly, but for the orthodox leaders it also is an instrument of power. More potent than any other factor is the fact that the consensus (*ijmā'*) is realized only through the *'ulamā* and that no cause has been so effective in bringing about change of policy and the initiation of new lines of action as the voice of the *'ulamā* declaring the mind of the universal Muslim community. The *ijmā'* is being prepared by the training which the candidates for the learned calling receive, whether it be in the Azhar University at Cairo, in the schools of Constantinople and India, or in the ancient seats of learning like Bokhāra. It is a long mechanical process aiming at fixing rigidly the positions of traditional orthodoxy in the thoughts and sympathies of the student and cultivating in him a fanatical devotion to the authority of the past, especially of the primitive age of the faith. It is natural that, when his opportunity to lead comes, he should adjust himself as an obedient part of the whole traditional system.

W. M. PATTON.

SUPERNATURALISM.—Supernaturalism is the mental attitude that has the supernatural for its object. The term is used by anthropologists[1] to express the fact that primitive magic and primitive religion alike rest on a belief in supernatural powers. In such a context it is convenient to have a word such as 'supernatural' that may be equated now with 'magical' and now with 'divine.'[2] For the savage respects the human magician 'on account of his continual intercourse with the supernatural world,'[3] and, on the other hand, must be allowed 'to possess a rudimentary notion of certain supernatural beings who may be fittingly called gods, though not in the full sense in which we use the word.'[1] Frazer, indeed, assumes a general tendency among savages to claim 'powers which we should now call supernatural,'[2] on the ground that 'a savage hardly conceives the distinction commonly drawn by more advanced peoples between the natural and the supernatural.'[3] F. B. Jevons, on the other hand, warns us against 'the error of imagining that there was a time when man did not distinguish between the natural and the supernatural. This error may take the form of saying either that to primitive man nothing was supernatural or that everything was supernatural.' He goes on to say:

'Primitive man took to himself the credit of his successful attempts to work the mechanism of nature for his own advantage, but when the machinery did not work he ascribed the fault to some overruling *super*natural power.'[4]

The objection of E. Durkheim, that to recognize breaches in a habitual order does not amount to the recognition of breaches in an order conceived as necessary after the manner of modern science,[5] is surely somewhat hypercritical in such a context. An objection of another kind, since it does not dispute the facts, but merely regards convenience of terminology, is that of J. H. Leuba,[6] who in naming the belief in supernatural power would call attention to the power rather than to the supernatural quality attaching to it, and hence would substitute for 'supernaturalism' the term 'dynamism,' originally used by A. van Gennep[7] to describe the 'impersonalist' theory of *mana* as contrasted with the 'personalist' theory of animism. Now there is much to be said for the view that the positive content of supernaturalism receives its fullest conceptual expression in terms of the *mana* type.[8] But the mental attitude in question has its negative side as well as the positive side connoted by *mana*, since it is called forth by the frustration of reasonable expectation; so that, as Jevons says, 'where the natural ended, the supernatural began.'[9] Again, this mental attitude is not so predominantly intellectual that it can be suitably designated by means of any mere concept that it generates. For the rest, anthropological terminology is, happily, in a somewhat fluid condition, and may be varied without impropriety in response to the needs of different theoretical purposes. It will suffice here to give a brief account of the chief aspects of the mental attitude under consideration.

1. **Emotional aspect.**—The emotional constituents of the magico-religious sentiment have been subjected to psychological analysis with results that show it to be, even in its simplest forms, exceedingly complex. 'Awe' is perhaps the word in our language that expresses its many-sided nature most fully, and awe is defined by W. McDougall as 'a tertiary compound of fear, wonder, and negative self-feeling.'[10] Round the object provided by the supernatural, fear, admiration, and submissiveness in varying degrees are organized into a mood, whether, in addition, that object be on the whole hated or loved, and consequently take rank as a manifestation of evil or of good supernatural power. Thus the sentiment is excited equally by magic and religion, the sorcerer, like the god, being 'surrounded by a halo of mystery and an atmosphere of awe.'[11] To appreciate the

emotional attitude of primitive man towards a universe which, beyond the narrow circle of the daily routine, is almost wholly unknown, yet felt to be pregnant with immeasurable possibilities of weal or woe, one should take stock one by one of the more baffling and startling elements in his experience, as is done, *e.g.*, by W. D. Wallis in his paper 'The Element of Fear [better 'Awe'] in Religion.'[1] Confined by his ignorance to the immediate here and now, the savage attributes mystic powers alike to the stranger at a distance and to those of his own race that are dead and gone. Nor does the familiar present remain unvisited by portents. The sky above him is disturbed by thunderstorm, eclipse, shooting stars, the aurora; earth and sea about him have their haunted pools, their fantastic rocks. Then living nature teems with wonders—trees and herbs, reptiles and fishes, birds and quadrupeds, that look strange or behave unaccountably. Moreover, man is mysterious to himself, with his visions, his seizures, the power of his eye and gesture, his sheer impressiveness, ranging from the majesty of kings to the gruesomeness of witches. For the rest, life is full of accidents and coincidences. Altogether, the savage world provides plenty of scope for that interplay of primary emotions of which awe is the outcome. Be it noted, however, that the essence of supernaturalism does not consist in bare feeling, but attains to expression through every aspect of the mental life at once.[2]

2. Intellectual aspect.—Since supernaturalism has a negative as well as a positive side, embodying a cautious doubt of the unknown combined with an effort to read a meaning into it, primitive thought needs a twofold set of concepts. Negatively the supernatural is *tabu*, positively it is *mana*.[3] Among savages, of course, such notions have not been built up into any systematic theory; nor is it possible to say at what stage of mental evolution they first came into use, though perhaps it would be hard to point to any primitive people that lacks them entirely. Moreover, since the supernatural implies evil power as well as good, ministering to the purposes of the sorcerer no less than to those of the priest, it is to be expected that *mana* will sometimes split up into two notions that stand antithetically for the good and bad kinds of supernatural power.[4] Finally, it cannot be said that rudimentary thought is altogether without an idea corresponding to that of the natural or normal. It seems highly doubtful whether we can credit the savage with a belief in what we call the uniformity of nature, as some have sought to do;[5] indeed, historically, the modern concept of 'nature' would seem to have descended from *mana*, its wonder-working quality having been shed by the way.[6] But in the Polynesian *noa*, the non-sacred, common, or permitted,[7] we have the counterpart, as in the Latin *profanus*, of 'nature' so far as it stands not for mechanism but for routine. We must not, however, look for definiteness in primitive categories, since they are never subjected abstractly and as ideas to reflective examination, but merely embody such more or less arbitrary associations as custom suggests and sanctions.

3. Practical aspect.—Seeing, then, that the savage may be said to live out his ideas rather than to think them out, it is in the sphere of his actual practice as regulated by social use and wont that we are likely to meet with the clearest indications of his mental tendencies. Primitive supernaturalism will declare itself primarily in a group of traditional activities through which the appropriate feelings and thoughts find their satisfaction. The question, then, is how far there is a distinctive province of behaviour corresponding to the interest in the supernatural. Now, there can be no doubt that among some peoples of low culture the cleavage between the secular and the magico-religious sides of the social life is made 'as with a hatchet.' Thus we are told of the Central Australian:

> 'From the moment of his initiation . . . his life is sharply marked out into two parts. He has first of all what we may speak of as the ordinary life, common to all the men and women, and associated with the procuring of food and the performance of corrobborees, the peaceful monotony of this part of his life being broken every now and again by the excitement of a fight. On the other hand, he has what gradually becomes of greater and greater importance to him, and that is the portion of his life devoted to matters of a sacred or secret nature. As he grows older he takes an increasing share in these, until finally this side of his life occupies by far the greater part of his thoughts.'[1]

B. Malinowski, however, referring to this passage, raises a doubt whether such a bipartition of activities is a universal feature of primitive society. He instances Veddas and Melanesians, among whom religious and secular interests and pursuits seem to shade into each other without perceptible break.[2] But, when Durkheim states[3] that 'the division of things into sacred and profane lies at the base of all religious organization,' he can hardly be intending to affirm that a religious organization worthy of the name is to be found among all mankind. It is surely enough if the generalization hold good in the typical case. Moreover, this theory of the 'two worlds' of the sacred and the profane, though convenient in certain contexts—as, *e.g.*, to explain those 'rites of passage' whereby a man during initiation, or a woman at child-birth, enters a condition of *tabu* and passes out again into ordinary life[4]—need not be pressed too hard, seeing that sacredness is to some extent relative, so that, *e.g.*, a man may be *tabu* to strangers without being so to his friends.[5] All that need be assumed here is that certain activities tend to be organized about the interest in the supernatural as embodied in a specific tissue of feelings and beliefs. The magico-religious life is unlimited in its claim on human endeavour, and in its ulterior effects on human welfare may be well-nigh all-pervasive. But the mental attitude that it demands cannot be continuously maintained. Whenever the tension is relaxed, 'nature,' in the shape of the effortless rule of habit, is busy making good the strain.

R. R. MARETT.

SUPERSTITION.—1. Signification and use of the term.—The word 'superstition' is used both in a concrete and in an abstract sense. We group together as superstitions a number of beliefs, habits, and fancies, tribal and individual, which we regard as not being founded on reasonable conceptions of the world and of human life, necessities, and obligations. The general or abstract term 'superstition' signifies the disposition to attribute occurrences to præternatural or occult influences, and to direct conduct with a view to avoiding mischief or obtaining advantages which such influences are supposed to produce. The precise connexion between the etymology of the word and its ordinary signification is not easy to trace. The prefix *super* seems to imply some excess, and this excess may generally be conceived as an exaggeration of a reasonable belief in some supernatural agents or agencies, with a readiness

to accept unverified statements as to spiritual or magical interference in the material world. The origin of the most potent and widely spread superstitions has already been discussed under various headings.[1] It seems therefore more suitable here to consider superstition as an abstract quality, and to regard it in its psychological and historical aspects.

Two points may be noted for the purpose of clearing the ground: (1) the intensely subjective way in which the word is commonly used. No man is ready to acknowledge himself as superstitious, but almost every one is ready to recognize superstition in another. We find that men of a particular race, culture, and tone of mind brand as superstitious the religious or ceremonial observances of an alien people, while charging such people with incredulity if they are unready to receive new doctrines equally superstitious from their own standpoint. 'What is religion to you is superstition to me,' and *vice versa*, is a tacit assumption against which we must be on our guard. (2) Superstition need not be in any way connected with mysticism (*q.v.*). True, the mystic who regards all things and persons as owing what reality they have to a divine and supernatural life or element is likely to have a strong desire to find traces of the spiritual and eternal manifested in or through the form of the material and temporal. But the reasonable mystic, by very reason of his belief in the spiritual nature of ultimate reality, is the less liable to give credence to fanciful and grotesque intimations from a spirit world. Plato, the greatest of mystics, was eminently sane and reasonable. If the same cannot be said of all the Neo-Platonists, the reason must be that some of them were less mystical because more material than he.[2] Some confusion, however, may arise from the circumstance that many minds (especially of a saintly or of a poetic order) attach a symbolic meaning to certain material phenomena or ceremonial acts without any excessive regard for their intrinsic value. Hence we have the interesting fact that, in the higher religions of an advanced race, we may have what seems to be identity in attachment to doctrine and ritual with far-reaching differences in fundamental religious conceptions. Hence the warnings of religious teachers, on the one hand against the sudden demolition of 'superstitions' which have, for the uneducated, been valuable from their association with religious thought and feeling, and on the other against the confusion of symbol and reality, which tends to materialize and crystallize popular religion.

The superstitious mind, then, is one that is not educated to discern the character of evidence, or that has not patience to suspend judgment in the presence of unfamiliar phenomena. If it is objected that some very powerful and (in some directions) well trained intellects have coincided with a superstitious bias, these exceptions would seem due to a want of mental balance.

2. Historical aspects.—Turning from the individual to society and to historical progress, we may say that, roughly speaking, superstition declines as the view of the universe becomes more scientific. True, the birth of many—perhaps of all—sciences is attended by crude hypotheses which lend themselves to strange vagaries of thought. This is specially evident in the pseudo-science of alchemy, whence emerged the science of chemistry.[3] Even the earliest efforts of Ionic thought were not without such vagaries, yet the Greek philosophers had in them the root of the matter—a whole-hearted desire after truth. Therefore they progressed, and their progress belonged to the Western world.

When, in May, 585 B.C., in the midst of a battle between Lydians and Medes, there occurred 'the first eclipse of which European science foretold when it should betide,' the date was to have 'a deeper interest for Europe than the warfare. . . . Thales of Miletus, the father of Greek, and thereby of European, philosophy and science, had studied astronomy in Egypt; and he was able to warn the Ionians that before such a year had passed—his lore could not tell the day or the hour—the sun would be darkened.'[4]

This does not, of course, imply that the Greeks had already become, or were ever to become, what we should call a scientific people. But to bring so uncanny an occurrence as a darkening of the sun within the range of calculable events was to cut the ground beneath many superstitions. Yet Greek religion and Greek life abounded with superstitions. The religion of the Olympians was bound up with beliefs about the gods which Plato would have excluded from his ideal city, and the old-world ritual which survived in popular ceremonies was yet more favourable to unreasonable fancies and actions. The Athenians were doubtless the most intellectual of the Greeks, yet their prosecutions for impiety show both a low standard of religious liberty and a high standard (if the expression may be used) of respect for ancestral religion. Anaxagoras, Pericles, Euripides, above all Socrates, suffered at the hands of their countrymen. True, their cause prevailed in so far that in the next century speculation was more free and scepticism had scope; and, after all, the moderation centred in the maxim *μηδὲν ἄγαν* seems to have checked any tendency to persecution like that of the Middle Ages and later. Nicias was, in spite of his popularity, blamed by posterity for delaying the retreat of the Athenians before Syracuse on account of an eclipse of the moon. But the point against him, most probably, was not that he was too ill-educated to know the cause of lunar eclipses (since most Athenians would then have been in his company), but that he preferred the almost certain event of annihilation for his army to the exceedingly doubtful risk of supernatural punishment if he neglected the state of the heavens.

Yet, by a kind of paradox, scepticism seems to have overshot the mark, and, by denying the possibility of all certainty, to have opened the way, for people who *must* believe something, to all manner of superstitious habits and practices.[1] The interchange of religious ideas, the foundation and migration of religious societies, and the general disintegration which followed the conquests of Alexander and the advance of Rome meant, to many individuals in many places, a remarkable development and enlightenment of the religious consciousness; but it also meant a recrudescence of Oriental and barbarous superstition. This is found even among the late philosophical sects, notably the Neo-Pythagorean.[2]

As might naturally be expected, in societies comprising men of culture considerably above the rank and file of their contemporaries, we have, from the ancient pagan world, emphatic protests against the mischief wrought by superstition. Chief among these is the great poem of Lucretius (*q.v.*), who sees in superstition, or in popular religion, the most potent source of human ill. The same missionary spirit pervades the treatise of Plutarch *περὶ Δεισιδαιμονίας*, in which he holds up to contempt the figure of the man who lives in perpetual fear of having, by some trivial action, offended supernatural powers. There is, however, this great difference between the two: that, whereas Lucretius would dispense with the gods altogether, Plutarch (*q.v.*) holds to a faith in the divine beneficence and to the propriety of observing ancestral rites. The most eloquent part of his essay is that in which he shows the absurdity of stigmatizing as blasphemous those who deny the existence of the gods, while tolerating those who spread evil notions as to their malignity and vindictiveness. The same contrast may be noticed in assailants of superstition at various periods: the uncompromising enthusiast would sweep away all religious beliefs and institutions, though he may, like Lucretius, entertain conceptions of the universe which may fairly be regarded as religious. The conservative reformer, however anxious to remove causes of distress and aberration due to mistaken theology, may cling to old habits of piety, and reinterpret ancient traditions in accordance with liberty of thought.

3. Superstition and Aberglaube.—It may be noted that the kinds of superstition opposed by moral reformers are generally those which arise from baseless terrors. There are, of course, other manifestations of the superstitious spirit of a comparatively innocuous kind, such as belief in fairies, superstitions concerning the weather, lucky and unlucky days, and the like. And there is a mass of what may be regarded as superstition about the accretions to almost every system of positive religion, which on the one hand changes it very

conspicuously from its original form, and on the other hand may bring it within the reach of minds unaccustomed to deal with abstract ideas. These accretions are sometimes, in order to avoid the unpleasant connotation of 'superstition,' called by the German name of *Aberglaube*. They consist both of ritual and of dogma, and are hardly ever entirely to be distinguished from the necessary appurtenances of the religion with which they are associated.

The Middle Ages are generally regarded as pre-eminently a time of superstition. The judgment is probably justifiable, though there were as many hard-headed and constructive thinkers at most epochs of the Middle Ages as there have been earlier or later. But apart from the mixture of races and consequent multiplication of superstitions in the declining Empire, with the deficiency of mental culture in the leaders of the barbarian races, there was a great force arising to control speculation — that of ecclesiastical authority. This, however, must be considered on two sides. The worst kinds of superstitions, or at least the most conspicuous kinds, especially in Eastern Europe, were distinctly discouraged by the Church — soothsaying, necromancy, charms, and the like. And there can be little doubt that many of the heresies crushed out by the mediæval Church were accompanied by superstitious vagaries. Still, the fact is patent that the suppression of free thought, especially as directed to Church doctrine and ritual, must have tended to the growth of δεισιδαιμονία in Plutarch's sense. Of course, when we speak of the suppression of free thought, we do not necessarily mean that a very large number of persons suffered from not being allowed to think freely. Probably the number who thus suffered was comparatively very small. But many more must have lived in perpetual fear of the unseen. The terrors of the Judgment Day and of the world to come are very familiar objects of mediæval art, and it is difficult for us to see how far they were practically mitigated by the harmonious setting forth of the more comforting and spiritual elements in Christianity, with which they were, perhaps not quite consistently, associated.

The Renaissance and the Reformation are commonly regarded as having given the death-blow to superstition—so far, at least, as their influence extended. It is certain, however, that the indiscriminate cult of antiquity, which in some sections of society accompanied the Renaissance, contained or encouraged superstitious fancies and observances of a novel kind. And as to the Reformation even in Protestant countries, practically a good deal of *Aberglaube* formed part of the newly established doctrines and usages, and the sway of spiritual authority was by no means removed. The great movement towards mental and spiritual emancipation is generally taken as beginning in the 18th century.[1] It is to be noted that the battle waged on behalf of human reason was not confined to the world of thought and opinion. Political institutions, social divisions, industrial methods, and moral conventions were to be submitted to the test of right reason, and, if they failed, to be extirpated forthwith. The bitterness with which the contest was carried on, and which reached its culminating point in the excesses of the French Revolution, was partly due to the belief that superstitious practices had been maintained chiefly by those who profited by them—from the medicine-men of a savage tribe to the officers of an established church or a hereditary monarchy. Although there is, of course, some ground for such a supposition, as a partial explanation of the evil in question, its wholesale acceptance shows a very deficient comprehension of human nature. Without intelligible reasons, man is always desirous of knowing more than he can know about the spiritual world, and he will more readily submit to authority which has a traditional, if not actually a divine, sanction. And the exact nature of the government and institutions which right reason would commend has, of course, been very differently conceived by socialists or revolutionists of various types. Still, the general recognition that all beliefs and practices ought to have some rational justification was a great point gradually gained. It does not, of course, imply that nothing should be believed without strict logical proof, or that no institution should be maintained that does not evidently serve some useful object. But it does embody the Stoic principle that life should be according to nature and according to reason, and thus it tends to eliminate most of what is injurious either in superstitions with regard to religion or in tame acquiescence in existing governments.[1]

[1] See artt. ENLIGHTENMENT, ENCYCLOPÆDISTS.

4. Influence of education.—The great agency making for the reduction of superstition during this century and the last is popular education. True, our elementary education can hardly as yet be called scientific, and what passes for scientific education may, after all, be superficial and narrow. But all sound teaching, at the present day, may be said to produce something like a scientific view of man and his environment—a view perfectly compatible with belief in the spiritual significance of life and even in a possible communion with non-material beings, but inconsistent with fanciful and trivial interpretations of natural phenomena as determined by præternatural agency.

If there should ever be a recrudescence of superstition in this generation or the next, it would probably be due, not to a defect in the scientific faculty, but to the expectations lately raised within the bounds of scientific investigation. Experts in psychology, especially those who have devoted themselves to what is technically called psychical research (*q.v.*), have, to many sane and scientific minds, proved the possibility of telepathy, thought-transference, and other processes which, fifty years ago, would certainly have been set down as superstitious. More than this, some persons of scientific mind and education believe that they have actually established and conducted a means of communication between living and dead.[2] When the persons engaged in these investigations are careful and scientific, we are inclined to accept their evidence, as we should on any other point of expert investigation. But in this field the 'media' used are of such uncertain character, the conditions and possibilities of communication so deeply veiled in obscurity, the desire to attain to fellowship with the departed so intense, that it is as well to approach all such problems with the most suspicious caution. There may be, as has often been said, a 'superstitious fear of superstition.' But, while suspending judgment on the result of the inquiries of experts, the non-expert may be in danger of falling into a superstitious habit of mind such as tends to upset entirely the mental balance.

LITERATURE.—For primitive superstitions see the works mentioned in the artt. here cited, esp. J. G. Frazer, *GB*[3], London, 12 vols., 1911–15; E. B. Tylor, *PC*[4], 2 vols., do. 1903. For the philosophy and history of the question see the various histories of philosophy and W. E. H. Lecky, *Hist. of Rationalism*, new ed., 2 vols., London, 1887; A. W. Benn, *Hist. of English Rationalism in the Nineteenth Century*, 2 vols., do. 1906; J. Masson, *Lucretius, Epicurean and Poet*, do. 1907; Plutarch, *Moralia*, including *de Superstitione*, tr. into very vigorous English by Philemon Holland, do. 1603; Matthew Arnold, *Literature and Dogma*, do. 1873, chs. on '*Aberglaube* invading' and '*Aberglaube* re-invading.'

ALICE GARDNER.

[1] See art. RATIONALISM. [2] See art. SPIRITISM.

SUPRALAPSARIANISM.—The term supralapsarianism is used in Calvinistic theology, in contrast with sub- or infra-lapsarianism, to denote a view of the divine decrees in which, for the manifestation of His glory, God is held to destine a certain portion of mankind to eternal life, and another portion to destruction, regarding both simply as creatures, and antecedently to any consideration of the Fall and sin. It is not meant that this purpose is actually carried out without regard to character or condition; but, in the order of decrees, it is first determined who are to be embraced in the one class, and who in the other; then the means are appointed—including creation, the Fall, sin, redemption—by which the end in each case is to be attained. So harsh a view of the divine procedure has always been in the highest degree repellent to Christian minds; accordingly, the great majority of Calvinists have shrunk from it, and contented themselves with the milder sublapsarian view, which affirms an election of God from the mass of mankind, regarded as already fallen.

On its historical side, the question is raised whether Calvin himself is to be classed as a supralapsarian or a sublapsarian. Some incline to the former view, but the truth seems to be that, when Calvin wrote, the question had not distinctly emerged, and the emphasis which he continually lays on election as a choice of some from a sinful mass, and on reprobation as grounded on the sinner's own evil, fairly warrants the more usual opinion that his doctrine inclined more to sublapsarianism.[1] On the other hand, Beza, Calvin's successor, Gomar, the colleague and opponent of Arminius in Holland, Twisse, the prolocutor of the Westminster Assembly, and a few others,[2] were conspicuous for their advocacy of supralapsarianism; and the Remonstrants, in the Arminian controversy, naturally sought to fasten this view on all Calvinists. It is really, however, an extreme opinion, and the bulk of Calvinists, as already said, have wisely kept themselves aloof from it. Turretin, *e.g.*, ably states and defends the sublapsarian position in his *Institutio*.[3] The Synod of Dort, in its decision, framed its canons on sublapsarian lines.[4] The *Westminster Confession* leans, in certain of its clauses, to the stronger view of Archbishop Ussher (author of the Irish Articles), and of a few members of the Assembly, but the tone of the debates in that body sufficiently shows that the prevailing opinion was sublapsarian, and the Confessional statement, taken as a whole, is of this character. The stronger view has, indeed, no symbolical sanction.

Cunningham, in his discussion of the subject,[5] claims that the controversy is one 'of no great intrinsic importance,' but this can hardly be allowed.

'A doctrine of this kind, which bids us think of beings not yet conceived of as even created (therefore only as *possibles*)—not to say as sinful—set apart for eternal blessedness or misery, and of the fall and redemption as simply means for effecting that purpose, is one which no plea of logical consistency will ever get the human mind to accept, and which is bound to provoke revolt against the whole system with which it is associated.'[6]

It cannot even be conceded, though it has often been contended, that this *is* the most logical form of the predestinarian doctrine. The end, it is argued, comes necessarily first in order of thought; then the means are devised which are to accomplish it. In the case of moral destiny, we are disposed to say, this is the precise inversion of the fact. There can be no legitimate consigning of a moral being to wrath, save as he is in some way viewed as deserving of that wrath; even in order of thought, therefore, the consideration of moral state must precede the sentence of rejection. If the reply is made that the sin itself is viewed in Calvinism as foreordained, this is doubtless true, but only in the sense in which every event in life is foreordained, viz. by God's decreeing to admit it into His providential plan and to overrule it for the ends of His wisdom. It is a totally different thing to affirm that sin is ordained as a means to the destruction of a being already foreordained to wrath prior to consideration of his sin.

It need only be added that the whole subject assumes a different aspect when fuller justice is done to the Scriptural idea of election as aiming, not at exclusion, but at subsequent wider inclusion.[1]

ŚVETĀMBARAS.—1. Origin and history.—'We,' said a Śvetāmbara once to the present writer, 'are the Catholics amongst the Jains; the Digambaras represent the Puritans'; and that does roughly sum up the difference between the two great sects of the Jains.[2]

Even during the lifetime of Mahāvīra[3] two parties probably existed, for the great Jain hero seems to have formed his community by uniting two different orders of mendicants, the Sthavira kalpa and the Jina kalpa. The Sthavira kalpa wore clothes, but one section of the Jina kalpa did not, going about like Mahāvīra himself, clad only in the four quarters of the sky. This outward and visible difference was symbolic of the differing types of men in the community, and only a strong statesman could have held the two parties together; under any great strain the cleavage was bound to become permanent.

According to the Sthānakavāsī Śvetāmbara tradition, the first crisis arose through a great famine that occurred in the reign of Chandragupta (? 310 B.C.), when 12,000 Jain monks went to S. India under Bhadrabāhu in search of food. These, being the young and vigorous members of the order, were able to carry out their rule in its entirety and so went unclad, whilst the other members of the community, who remained at home under Sthūlabhadra, amounting also, the legend says, to 12,000, were allowed (owing perhaps to age and infirmity) to wear clothes, no matter to which of the two parties they had originally belonged. When Bhadrabāhu returned home after the famine, although he became once more head of an undivided community, he was never able to insist on nakedness as a rule of even a section of the community. The second cause of schism also arose during this famine—at least according to the Sthānakavāsī Śvetāmbara tradition; for it was then, during his leader Bhadrabāhu's absence, that the second in command, Sthūlabhadra, called a council at Pāṭaliputra to collect the sacred books. The council were able to produce only eleven *Aṅga*, but Sthūlabhadra himself supplied the missing twelfth *Aṅga*. Bhadrabāhu on his return was annoyed to find that this council had been held in his absence, and not unnaturally, though irritably, declared that the twelfth *Aṅga* was hopelessly lost. It only remained now for a leader to be found for the malcontents to hive off, and (if the legend be true) irritability had much to do with that leader's decisive action. About forty years after the great famine (according to Tapāgachchha Śvetāmbara tradition, about A.D. 142; according to Sthānakavāsī, A.D. 83; and according to Hoernle, A.D. 79 or 80) the reins of government fell into the weaker hands of a man called Vajrasena, and the community finally divided. The Śvetāmbara quote

the following legend to account for the actual cleavage :

A monk named Śivabhūti had been given a most beautiful blanket by the king in whose service he had been at the time of his initiation. His spiritual preceptor warned him that it was becoming a snare to him and advised him to give it away ; this he refused to do, so his preceptor took the extreme step of tearing up the blanket in its owner's absence. Śivabhūti, when he discovered what had happened, was so angry that he declared that, if he could not have the one possession which he valued, he would keep nothing at all, but would wander in entire nakedness like the Lord Mahāvīra himself ; and he then and there started a new sect, that of the naked Digambara.

This very human legend which the Śvetāmbara (the 'White-clothed') tell of their unclothed rivals not only accounts for their nakedness, but also goes on to explain another difference between the two sects ; for, when Śivabhūti's sister wanted to join his order, seeing that it was impracticable for a woman to go about nude, he roundly told her that it was impossible for a woman to become a nun, or to obtain *mokṣa* (*q.v.*) without rebirth as a man, and thus laid down for all time a distinctive tenet of the Digambara. Important as these legends are, it must be remembered that they are quoted only as illustrative of the Jain point of view, for their confirmation is sadly to seek, and the legends connecting Chandragupta with the faith are essentially open to suspicion.

2. Distinctive tenets and practices.—We are on firmer ground when we notice the main differences between the two sects at the present day. We are already prepared for the fact that the Śvetāmbara list of sacred books is not accepted by the Digambara, and that, since they hold that no woman can attain *mokṣa*, the Digambara will not admit the Śvetāmbara tradition that Mallinātha (the nineteenth *tīrthaṅkara*) was a woman. But the two sects differ very considerably about the life-story of Mahāvīra.

The Śvetāmbara say that their great saint married and enjoyed life to the full before entering an order, and that, even when he at last decided to do so, he waited till his parents' death, and until he had gained his brother's consent, lest he should grieve any one before receiving initiation, which he obtained in his thirtieth year. The more austere Digambara tradition, however, is that their founder never married ; and, having no hesitation about hurting any one's feelings, renounced the world at the mature age of eight. Even the prenatal stories differ, for the Śvetāmbara believe that Mahāvīra's mother had fourteen wonderful dreams ; the Digambara say that she had sixteen ; while the legend of the removal of the embryo of Mahāvīra from Devānandā to Triśalā is a Śvetāmbara one.

The lists of the heads of the community since Śivabhūti of course differ also. The Śvetāmbara generally arrange their philosophy in nine categories ; the Digambara arrange very much the same philosophy under seven heads. One point of divergence on which they lay great stress is that, according to the Śvetāmbara, a *tīrthaṅkara* needs food to support him until he dies ; while the Digambara believe that, once a *tīrthaṅkara* has attained omniscience, he has no further need of meals.

There are also differences in actual practice. A Śvetāmbara ascetic may keep a loin-cloth, a shoulder-cloth, and a blanket to wear. Indeed, including these and his brush, mouth-cloth, and wooden vessels, he is allowed to retain fourteen possessions in this world, whereas a Digambara is absolutely nude and, though provided with a brush and peacock's feathers, has to live entirely in the jungle. The Śvetāmbara laymen complain that their ascetics interfere too much in their conferences ; this complaint is, of course, never brought against a Digambara ascetic, whose lack of clothing interns him for life in the wilderness.

There are also different rules about begging for the ascetics of the two orders, and the Digambara ascetics have no *upāsarā*. Again, the Śvetāmbara idols have glass eyes inserted in the marble, wear a loin-cloth, and are bedecked with jewels, whereas the austere Digambara idols are nude and are represented as being dead to the world, with eyes cast down. There is naturally therefore a difference in the installation ceremonies of their idols. The ordinary worship differs also. The Śvetāmbara, when performing the eightfold worship, offer flowers and fresh fruit to their idols, and so on great festivals do the Visapanthī Digambara ; but the Terāpanthī Digambara never offer flowers or fresh fruit ; in their stead they use cloves, dry coco-nut, sugar, and rice.[1]

There is another very interesting difference. A Digambara Jain has no private idol in his own house, but, if a Śvetāmbara is a wealthy man and lives far from a temple, he may have his own private chapel. This chapel is separate from the house and can be entered only by persons in a state of ceremonial purity. In the chapel, if he can afford it, he may have a *pratīmā* (an image of any one of the twenty-four *tīrthaṅkara* that an astrologer selects for him), or he may have a *siddha chakra* (a tray on which are depicted the leading points of the Jain faith).[1] The householder offers the eightfold worship to the *pratīmā*, but only washes and wipes the *siddha chakra* and marks it with sandalwood paste. An instructed Śvetāmbara would never ask a boon even of the idol in his own house : he would only stir himself up to future efforts by meditating on it. But if, as often happens, an uninstructed Śvetāmbara does ask a gift, his prayer would be answered not by the *tīrthaṅkara* (who as a matter of fact does not even hear it) but by the *yakṣa* in attendance on the *tīrthaṅkara*.

3. Śvetāmbara sects.—The main division of Śvetāmbara Jains is into Sthānakavāsī and Derāvāsī. The Sthānakavāsī are a non-idol-worshipping sect, which arose about A.D. 1474.[2] Excepting on the crucial point of idol-worship, they do not differ much from other Śvetāmbara Jains.

At the present time the chief sects among idol-worshipping (Derāvāsī) Śvetāmbara are the Tapāgachchha (whose ascetics use red alms-bowls, and whose laymen in their devotions first confess their sins of walking and later their sins of trading), the Kharataragachchha (whose ascetics use black alms-bowls, and whose laity first confess their sins of trading and later their sins of walking), and the Añchalagachchha and the Pāyachandagachchha, whose divergences are very slight.

It must be remembered that these are only spiritual distinctions and do not interfere with the freedom of marriage between different sects. The chief castes among the Jains are Osavāla, Poravāḍa, Śrīmālī and Śrī Śrīmāla, which are each divided into two sections, Dasā and Vīsā. It is impossible for members of these different castes to intermarry : thus an Osavāla Kharatara could marry an Osavāla Sthānakavāsī, for, though the sect differs, the caste is the same, but a Dasā Osavāla could never marry a Vīsā Osavala, and still less could any Poravāḍa marry any Osavāla. It is interesting to notice, however, that any Jain could dine with any other Jain, Śvetāmbara or Digambara, whether Osavāla or Śrīmālī ; but they would not interdine with any Brāhman convert to Jainism.

LITERATURE.—Through the kindness of Jain friends the writer was given an opportunity of translating this art. to the leading Tapāgachchha Śvetāmbara Sādhu in Rājkot in his *apāsaro*, when the principal Sthānakavāsī Jain *paṇḍits* were also present ; the art. has thus had the advantage of criticisms and suggestions from both parties at first hand. See also A. F. R. Hoernle, *Annual Address to the Asiatic Society of Bengal*, in *JASB*, Calcutta, 1898 ; Mrs. Sinclair Stevenson, *Notes on Modern Jainism*, Oxford, 1910, and *The Heart of Jainism*, do. 1915.

SWAHILIS.—See ZANZIBAR.

SWAN-MAIDENS.—The beautiful and poetic myth of swan-maidens is of early origin and, in varying forms, of very wide diffusion. The central idea of the myth is that certain beings, half-mortal, half-supernatural, have the power of metamorphosis into bird-form; connected with this are two secondary ideas: (1) that this power is dependent on the possession of a magic attribute, which was generally a bodily covering, such as a feather coat, robe, or veil, but sometimes merely a ring or chain; (2) that either this being, when in human form, or her captor is subject to a tabu of some kind. There are so many variations on these themes that it is impossible to do more than refer briefly to some of the most significant versions.

1. In Oriental folk-lore. — Oriental folk-lore furnishes many instances of bird-maiden stories. In Indian tradition we find the very early myth of Urvaśī embedded like a jewel in the dull ritual of the *Śatapatha-Brāhmaṇa*.

The *apsara*, or nymph, Urvaśī loves one of the lunar race of kings, Purūravas; in wedding him she stipulates that she must never look upon him naked. By a trick played by the *gandharvas*, supernatural beings who desire the return of their former playmate, the promise is broken, and Urvaśī vanishes. Purūravas, seeking her, finds her and her companions swimming on a lotus-lake in the shape of water-birds. They 'appear to him,' *i.e.* assume human form, but in response to his pleading Urvaśī replies: 'I have passed away like the first of dawns. . . . I am like the wind, difficult to catch.'[1] Finally, however, she relents, and the couple are re-united.

In the *Vikramurvaśī* of the poet Kālidāsa, a drama based upon this story, the bird-myth has almost disappeared, except for Urvaśī's power of flying and for the constant references to swans throughout act iv. Her change into human form depends merely upon the laying aside of a veil, in itself probably a stage convention for invisibility; the marital tabu, which Lang[2] characterizes as a relic of 'a traditional Aryan law of nuptial etiquette,' assumes a quite different form.[3]

The myth re-appears in one of the finest tales of the *Thousand and One Nights*, that of Hasan of Bassorah.

Hasan is enjoying the hospitality of a family of princesses; when obliged to leave him, they enjoin him not to open a certain door. He disobeys, and finds a fair pavilion and a bathing-pool, to which come flying from the desert ten birds, one among which was pre-eminent for beauty. Each bird, as it alighted, 'rent open its neck-skin with its claws, and issued out of it, and lo, it was but a garment of feathers.' After their departure Hasan, who has become deeply enamoured of the fairest bird-maiden, confesses his disobedience to his hostess, and is told that this damsel is 'the daughter of the sovran of the Jans. He hath an army of women, smiters with swords, and lungers with lances, . . . and the plumed skins wherewith they fly are the handiwork of enchanters.' Hasan is advised to steal the feather dress and never again to let it come into the owner's hands; he does so, but after three years the wife by a ruse secures the dress, buttons it on, and flies away. Hasan tracks his wife to the islands of Wāk-Wāk, inhabited by the warrior women, and recovers her.[4]

The story of Janshāh[5] is a slighter tale that begins similarly; but the bird-maidens are only three in number, and are 'as doves, eagle-sized.' The husband's device to secure the feather coat is to place it in a chest, leaden-bound, which is built into the foundations of the palace; but in vain, for the lady traces it by scent and digs it out.[6]

The Wāk-Wāk islands of the former tale have been identified with various Melanesian islands;[7] it is not surprising, therefore, to find the tale of Hasan re-appearing in the Celebes in a modern form, which Tylor quotes in connexion with the heaven-plant myth.[1] Tatar versions of the myth are signalized as being the only ones to represent the bird-maiden as a malignant being, half-vampire, half-fury;[2] in the Tatar poem quoted by J. G. Frazer[3] to illustrate the external soul belief, the hero wrestles with the evil swan-woman for 'moons and years.'

2. In classical tradition. — Classical tradition does not seem to have preserved any swan-maiden tale in a complete form, but that the main idea was a familiar one is evident from the Cycnus myths, the bird-transformation of the comrades of Diomedes, the story of Leda, and the symbolic connexion of swans with Apollo, with the Muses, and with Aphrodite.[4] Modern Greek folk-lore represents the Nereids as flying maidens, similar in many points to swan-maidens.[5]

3. Slavic.—Slavic folk-lore bears frequent testimony to the myth. The South Slavs were naturally more influenced by late Greek and by Oriental tradition, and the Bulgarian *samodivas*, and the Serbian *vilas*, like the Greek Nereids, resemble the swan-maidens; *e.g.*, the *vilas* are associated with water and have the power of flying.[6]

The Polish fairy-tale of the prince and the twelve geese-princesses shows that the myth in its simplest form was known to the Western Slavs.[7] The most important Russian example is the tale of 'Sweet Mikāilo Ivānovitch the Rover' and Mārya the white swan; this begins in fairly conventional style, although without the feather dress, but later it diverges considerably, for Mārya dies, is magically revived, and finally forsakes her husband for another love.[8]

4. Celtic.—Old Celtic tradition has two beautiful and elaborate swan-maiden tales, as well as an episode in the story of Etain, wife of Eochaid, who is carried off by the hero-god Mider in the form of a swan.[9]

The story of the 'Children of Lêr,' one of 'the three most sorrowful tales of Erinn,' is an example, with Christian 'overlay,' of that variant of the myth in which the swan shape is enforced by malignant magic. The four royal children, metamorphosed for 900 years, retain their powers of human reasoning and speech, and have the gift of singing 'plaintive music at which the men of the world would sleep, and there shall be no music of the world its equal.'[10]

This power of song is turned to account in the Christian episode which concludes the tale.[11] 'The Dream of Oengus' conforms more closely to the regular swan-maiden type, so much so that J. A. MacCulloch[12] dismisses it as of no mythological or religious value; its artistic value, however, is very great.

The god Oengus is smitten with love for a dream-maiden, the original of whom proves to be Caer, a princess who spends every alternate year in the form of a swan. Oengus, having once seen her in mortal form, succeeds in discerning her in swan-guise from among her 150 companions 'with their silvery chains and golden caps around their heads.' He woos and wins her, and flies off with her, himself also metamorphosed, and their singing is of such beauty as to lull to sleep all its hearers for three days and three nights.[13]

5. Teutonic.—The Teutonic races bear the distinction of having developed the swan-maiden myth most elaborately, and of having enriched it by connecting it with other supernatural ideas. Traces of the symbolic importance of swans are found in the primitive myths of the life and death

[1] This formula, 'difficult to catch,' recurs in the Welsh tale of the Van Pool, quoted by Hartland, *Science of Fairy Tales*, p. 275 ff.

both of the world and of individuals; thus the two swans, the progenitors of all the swan-kind, that float on the Urtharbrunnr of the old Norse cosmogony,[1] may be contrasted with the swan that lived, according to Finnish myth, on the river of Tuoni or Death.[2] In later folk-tale we find a swan living on a hidden lake, which maintains the world in equipoise by carrying a ring in its beak; when it drops it, the end of the world will come.[3] Popular saying still remembers the bird as one of omen and augury;[4] in Rügen, swans, not storks, are the bringers of new-born children,[5] while, on the other hand, the sight of a swan in flight may betoken death,[6] and swans are often leaders of the spirit-host.[7] The ideas of animal shape-changing and of the external soul favoured the development of the swan-maiden myth in folk-lore. The Scandinavian North, as one of the chief haunts in Europe of the wild swan, showed itself especially alive to the beauty and significance inherent in the myth; Grimm,[8] influenced perhaps by the legends of the 'goose-footed woman,' 'la reine pédauque,' and 'Berthe aux grands pieds,' thinks that the goose supplanted the swan in legend, but this seems hardly proved. The power of flying and the possession of a feather coat were attributes of many gods in the Norse pantheon. The swan-maiden of the Scandinavians appears to have been merged into the Norns on the one hand and the Valkyries on the other, who themselves often have traits in common. The connexion of swans with augury and with the Urtharbrunnr, the home of the Norns, prepares us for the former aspect; the power of 'riding through the air' possessed by the Valkyries prepares us for the latter; and we have already seen the bird-maidens as warrior-maidens in the story of Hasan of Bassorah.

The swan-maidens of the *Nibelungenlied* are Norns also; as swan-maidens they appear to Hagene 'like birds,' and they fall into his power when he takes their garments, but they are also 'wise women,' and one gives him prophetic warning.[9] The maidens of the *Völundarkvitha*[10] are conventional swan-maidens with their 'swan-coats,' but they are also Valkyries, for they appear helmeted. Again, the hero Helgi is helped in battle by Kāra, a rebirth of the Valkyrie Svava, who hovers singing above him.[11] Fridlevus II., king of Denmark, is given helpful warning before a battle by the song of three swans.[12] After this it is not surprising to find also traces of a connexion between swan-maidens and the *fylgja*, or female guardian-spirit; thus the *fylgja* of a beautiful woman appears as a swan.[13]

6. The swan-knight.—The swan-knight seems to have been monopolized and localized by Teutonic mythology, although there are traces of the idea in classical legend, as in the Cycnus myth already mentioned,[14] and although the Teutonic myth appears to have fused with Celtic Arthurian legend. The popularity of the charming tale of Helyas, knight of the swan, and supposed ancestor of Godfrey of Bouillon, is attested by the numerous versions of it in various languages.

In the popular German fairy-tale the enchanted brothers owe their restoration to human form, not to the prowess of their brother, as in Helyas, but to the devotion of a sister. Of the other swan-knights of Brabant, the link with the Graal legends has brought Lohengrin, son of Parsival, most into prominence and popularity. The fact that the swan-hero arrives from an unknown land in a skiff, and departs in the same way, has led Grimm[1] to trace the beginning of the Teutonic swan-knight myth to Scyld and Scēaf, semi-divine founders of the Danish race, of whom a similar tale is told, although the connexion with the bird-myth is very obscure.

7. Interpretations.—The interpretations of the swan-myths have been various; the earlier school of mythologists saw in them nature-myths, the swan-maiden being the white cloud, her captor the storm-spirit.[2] Others have explained the swan-maiden, who is subject to mysterious prohibitions and who in the end is almost always lost to her captor, and the swan-knight, who must not reveal his name or place of origin, as denizens of the world of the dead or of the islands of the blessed.[3] A more prosaic view takes into account merely the totemistic aspect which the myth shows in common with all animal shape-changing tales, points to the swan-maidens and swan-knights as founders of clans, and compares them with such figures as Mélusine of Lusignan.[4] The most modern theory brings the tabu into prominence, to the overshadowing of other aspects, and adduces the wide evidence now forthcoming of marital tabus among primitive peoples;[5] thus a curious piece of corroborative evidence on the symbolic connexion between swans and women has been found in the rites enforced on secluded girls among American Indian tribes.[6] Fortunately for the appeal of the myth, none of these theories has power to detract from, but all serve only to enhance, its elusive and poetic beauty.

M. E. SEATON.

SWĀT or UDYĀNA.—This is a famous principality in Independent Eastern Afghanistan, between the latter country and Kashmīr, to the south of Chitral and the Pamirs. It receives the name of Swāt from the river of that name (the Svastu, in Sanskrit), which joins the Kabul branch of the Indus above Peshāwar. Its literary name of Udyāna (in Prakrit, Ujjāna) is ascribed to its 'garden or park-like' appearance; for it is an exceptionally richly cultivated and well-watered beautiful Alpine valley. Through this Indo-Scythian country Alexander descended for his invasion of India, crossing, it is generally supposed, the Malakand Pass, which is on the main route to the Indian plains; but Swāt is best known for its fame as an ancient centre of Buddhism. It is still thickly covered with the ruins of Buddhist monuments and temples, richly decorated with some of the finest sculptures of the Græco-Buddhist or so-called Gandhāra (*q.v.*) type of art. These sculptured friezes and terra-cottas date chiefly between the 2nd and 5th centuries A.D.; and a collection of several hundreds was made by the present writer during the Chitral expedition of 1895 and is now preserved in the Calcutta and Peshāwar museums.[7] The Chinese Buddhist pilgrim Fa Hian, who visited the country *c.* A.D.

400, says: 'The religion of Buddha is very flourishing . . . in all there are 500 monasteries, they belong to the Little Vehicle (*Hīna-yāna*) without exception.'[1] But, when Hiuen Tsiang visited the land *c.* A.D. 630, he found that nearly all the convents, some 1400 in number with formerly 18,000 priests, were 'waste and desolate.'[2] It is a striking commentary on Fa Hian's reference to the exclusive prevalence of the 'Little Vehicle' form of Buddhism that as a fact all the sculptural remains are of the 'Great Vehicle' (*Mahā-yāna*).

It was regarded by Fa Hian as the most northerly province of India, and the food and clothing of the people were the same as in India, and this is still the case—the people dress in white. The dimensions of the Swāt country, as described by Hiuen Tsiang at 5000 *li* (about 833 miles) in circuit, show that it in those days evidently included, in addition to the valley of Swāt, also the Chitral and Dard adjoining countries and the mountains on the right bank of the Indus, even beyond the great bend of the river to the south.

It was the native country of Padma-saṁbhava (*q.v.*), the founder of Lāmaism in Tibet; and the notorious prevalence of Śaivite magical rites in the manuals ascribed to that saint in the Tibetan is somewhat in keeping with the old reputation of this country for sorcery. Hiuen Tsiang, in his visit to this land about a century before Padma-saṁbhava's period, writes: 'The science of magical formulas is become a regular professional business with them (the men of Swāt or Udyāna).'[3]

The belief in serpent-dragons of rivers and springs was especially prevalent here. It was at the source of the Swāt river that was located the legendary water-dragon or serpent Apalāla, whose conversion by Buddha is a favourite motive in Buddhist art, both north and south. Hiuen Tsiang refers especially to the 'white water' issuing from this spring, as also does al-Bīrunī about the 11th cent. A.D.,[4] which would doubtless be snow-water rather than glacial, yet it suggests that the river-name Svastu may have originally been derived from *sveta*, or *sweta*, 'white,' which approximates the modern name of that river, 'Swāt.' Confirmation of this ancient water-serpent worship was found by the present writer in a Kharoṣṭhī inscription upon a great boulder at a spring of which the record reads from a rubbing taken by the present writer: 'By the son of Dati, the Thera (Buddhist monk) Nora, a tank was caused to be made for the worship of All Serpents (in) the year 113.'[5] This date, from the palæographic details, is placed about 65 B.C.

SWEARING.—See OATH, PROFANITY.

SWEAT, SWEAT-HOUSE.—Sweat, a colourless fluid containing about 2 per cent of solid matter, is a secretion of the sebaceous glands. Its chief function is to regulate the heat discharge of the human body. It is connected with some curious and interesting religious and magical customs in various parts of the world.

1. Sweat in magic. — Primitive man regards sweat, like blood, saliva, hair, and nail-parings, as a medium both for setting sorcery in motion against an enemy and for working the more harmless forms of magic. Codrington says that among the Melanesians the belief prevails that a leaf with which a man has wiped the perspiration from his face may be employed to work mischief against him.[1] A like belief is found among the Negroes of N. America.[2] Some of the natives of N.E. New Guinea take elaborate precautions to prevent a drop of their sweat from being made use of by a sorcerer; on leaving a camping-place, they stab the ground all over with their spears.[3] Some of the most curious uses to which this exudation of the human body has been put are illustrated by a group of customs connected with love magic.

'A cake, an apple, or a sweetmeat impregnated with the sweat of the giver is a powerful philtre throughout the greater part of northern and central Europe, from Cairn Gorm to the Carpathians.'[4] A Hungarian girl steals meal and honey at Christmas-time, bakes a cake, takes it to bed with her for one night, and then bestows it on a youth whom she wishes to fall in love with her.[5] W. R. Paton says that in three Νομοκάνονες (confessors' manuals) of the Orthodox Church, which are, he believes, less than three centuries old, 'women are accused of rubbing dough on their bodies, and giving it to eat to men in whom they wish to arouse satanic love.'[6]

The victim of such love magic can, however, have recourse to a counter-charm of the same character. 'It was narrated that if a man who, under the influence of a philtre, was forced to love against his will, would put on a new pair of shoes, and wear them out by walking in them, and then drink wine out of the right shoe, where it could mingle with the perspiration already there, he would promptly be cured of his love, and hate take its place.'[7]

A similar idea underlies the superstition prevalent among the Negroes and Indians of N. America, and also in Belgium, that, if the owner of a dog wishes to make the animal faithful to him, he should give it some bread which has been soaked in his sweat.[8] In the island of Tutu, in the Torres Straits, men drink the sweat of renowned warriors to acquire courage.[9]

The mythology of ancient Egypt seems to have ascribed a sacramental virtue to the sweat of Osiris. In the pyramid libation-formulæ the libations appear to be his sweat; and in the ritual of Amon the incense appears to be crystallized drops of it.[10] A song quoted by A. Erman speaks of the Nile as the sweat of Osiris' hands.[11] The Negroes of Jamaica identified a man's luck with the perspiration of his hands, and believed that, if the latter were wiped away, the former would disappear.[12]

2. The sweat-house. — The ceremonial use of vapour baths is a custom of great antiquity and wide geographical distribution, being found both in N. America and in N. Europe. In the former continent it was probably known to every tribe north of Mexico, though along the north-west coast it has been superseded by sea-bathing.

'The type of the ordinary sweat-house seems to have been everywhere the same. Willow rods or other plant stems were stuck into the ground and bent or fastened with withes into a hemispherical or oblong frame-work, which generally was large enough to accommodate several persons. A hole was dug conveniently near the door into which stones, usually heated outside, were dropped by means of forked sticks. These were sprinkled with water to generate steam. A temporary cover of blankets or skins made the enclosure tight.'[13]

In each tribe there were certain prescribed rules for the construction of the sweat-house. In some cases, however, the communal ceremonial chamber was used for this purpose. Sometimes it was used as a kind of men's club like the Pueblo *kiva*,

women being permitted to enter it for certain ceremonial purposes, but not for sweating. Among certain tribes on the Pacific coast women were not even permitted to gather wood for the holy fire to be kindled in the sweat-house. In California, where sweating always had a religious significance, some of the tribes used the sweat-house as a sleeping-place for adult males. Half-an-hour was usually spent in the sweat-house, and then the bather plunged into a stream, if there was one at hand.

'Among the Eskimo, hot air was used in place of steam and in Zuñi, and probably in the Pueblos generally, hot stones near the body furnished the heat.'[1]

Some tribes lit the fire in the sweat-house in autumn and kept it alive till spring. Bancroft says of the Northern Californians:

'A fire is built in the centre [of the sweat-house] in early fall and kept alive till the following spring, as much attention being given to it as ever was paid to the sacred fires of Hestia.'[2]

Sweating in N. America was practised for three purposes: (1) *religious*—such as purification and the propitiation of spirits, preparation for war, and on arrival at puberty, when it was usually attended by scarification and mutilation; (2) *therapeutic*—prescribed by a shaman, who stood outside and invoked the spirits believed to cause the disease (among the Plains Indians shamans who officiated at these ceremonies had usually to pass through the sweat-house themselves for purposes of purification); (3) *social and hygienic*—a number of persons would enter a sweat-house for the purpose of enjoying the luxury of a bath (among certain tribes this became an almost daily practice, and was perhaps a degeneration).

The sweat-bath is also used by the Eskimos of Bering Strait, among whom the men and boys indulge in it about once a week, or once in every ten days during winter, but with this people it does not appear to possess a religious significance.[3]

Among many tribes the sweat-house had its own guardian spirit or *manitu* (*q.v.*).

Among the Lillooets of British Columbia 'men who had the spirit of the sweat-house for their guardian spirit made a sweat-house of elk-skin supported on wands, and inside it they placed four large stones, which were heated to make the steam for the bath.'[4]

It was believed among the Algonquins that a man when in the sweat-house might acquire *manitu*. A Fox Indian, relating his experiences during a sweat-bath, once said:

'Often one will cut one's self only through the skin. It is done to open up many passages for the manitou to pass into the body. The manitou comes from the place of its abode in the stone. It comes roused by the heat of the fire, and proceeds out of the stone when the water is sprinkled on it. It comes out in the steam, and in the steam it enters the body wherever it finds entrance. It moves up and down, and all over and inside the body, driving out everything that inflicts pain. Before the manitou returns to the stone, it imparts some of its nature to the body. That is why one feels so well after having been in the sweat-lodge.'[5]

Among the Thompson Indians of British Columbia, when a boy reached the age of puberty, he went through certain ceremonies to obtain a guardian spirit.

In the sweat-bath 'he prayed to the spirit of sweat-bathing under the title of "Sweat-bathing Grandfather Chief," begging that he might be strong, brave and agile, lucky, rich, a good hunter, a skilful fisherman, and so forth.'[6]

The Ojibwa (*q.v.*), an Algonquin tribe, had a secret society called the 'Midē'wiwin,' or society of the shamans. For four days before initiation into it a candidate would purify himself in the sweat-bath.

'In all ceremonies, prophetical or medico-magical, great reliance is placed on the vapor-bath. . . . It is entered with sacred feelings, and is deemed a great means of purification. Secret arts are here often disclosed between *Medais* [shamans] of high power, which could not be imparted in other places, or positions, believed to be less subject to the influence of sanctifying power.'[1]

When we turn to the Old World, we find a striking resemblance to the American customs in Herodotus's description[2] of the use of the sweat-bath among the Scythians as a means of purification, after mourning. The construction of the sweat-house was, however, simpler than in America. Three sticks were stuck in the ground, leaning towards each other, and around them pieces of felt were tightly stretched. A dish containing red-hot stones was placed inside. Hemp seed was then thrown on to the stones. A close parallel to this custom was found among the Delaware Indians, and is described by Tylor:

'At their festival in honour of the Fire-god with his twelve attendant manitus, inside of the house a small oven-hut was set up, consisting of twelve poles tied together at the top and covered with blankets, high enough for a man to stand nearly upright within it. After the feast this oven was heated with twelve red-hot stones, and twelve men crept inside. An old man threw twelve pipefuls of tobacco on these stones, and when the patients had borne to the utmost the heat and suffocating smoke, they were taken out, generally falling in a swoon.'[3]

The sweat-bath, as used among the peasantry of Great Russia, possesses the nature of a ceremonial purification even at the present day. It is taken weekly on Saturday afternoons, and all kinds of pollution must be avoided till after the service on Sunday morning.[4] Among the northern Finns, for the *savna*, or sweat-bath, a log-hut is used. The bath is frequently taken *en famille*.[5] With this people, however, and also with the Lapps, who make use of the sweat-bath on Saturdays before putting on their clean clothes, it appears to be an entirely secular institution.[6] Vapour baths were in use among the Celtic tribes, and the sweat-house was in general use in Ireland down to the 18th,[7] and even survived into the 19th century. It was of beehive shape and was covered with clay. It was especially resorted to as a cure for rheumatism.[8]

Vapour baths were used by the Greeks and Romans; details for their construction are given by Vitruvius.[9] The sweat-bath, which in England has been miscalled the 'Turkish bath,' being in reality of Russian origin, was introduced into this country by David Urquhart, M.P. (1805–77).

3. Origin and distribution.—The presence of the sweat-bath both in N. Europe and in N. America at once raises the question whether it has originated independently in each of these continents, or whether it has reached them from a common centre of distribution. It is essentially a northern institution, and one belonging to the Mongoloid branch of the human family. M. A. Czaplicka suggests that the Slavs of Great Russia probably borrowed it from the Finns of the Middle Volga. There are many unsolved problems connected with the ethnology of the Scythians, but there appears to have existed among them a Finno-Ugrian element from which most likely the sweat-hut was derived. We should naturally expect to find the sweat-hut in N. Asia, whose inhabitants form an ethnological bridge uniting the Mongoloid peoples of Europe and N. America. We are,

however, disappointed in this expectation, since among the aborigines of N. Siberia it is not indigenous, but is in use only among those tribes which, like the Yakuts, have derived many elements in their culture from the Russians. We seem, then, to be led to the conclusion that the sweat-bath originated independently in both Europe and America, or else that it originated in a more southerly latitude than N. Siberia. The vapour-bath appears to be one of those institutions which were originally indulged in for hygienic purposes, but afterwards, owing to their beneficial results, came to be connected in the mind of primitive man with mysterious unseen powers, and hence were used in connexion with religious rites. Now, however, the sweat-bath seems to be regaining its former secular character.

LITERATURE.—This is given in the footnotes.

H. J. T. JOHNSON.

SWEATING.—See ECONOMICS.

SWEDENBORG. — 1. Life and works. — Emanuel Swedenborg was born in Stockholm on 29th Jan. 1688. He was the second son of Jesper Swedberg, bishop of Skara and previously professor in the University of Upsala. The family was ennobled by Queen Ulrica Eleonora in 1719, when the patronymic of Swedberg was changed into the name of Swedenborg.

Little is known of Swedenborg's childhood. After completing his studies at Upsala in 1709, he started on an extended foreign tour, and he was in England in 1711, 'studying Newton daily and very anxious to see and hear him.'[1] We gather from one of his letters to his brother-in-law, Dr. Ericus Benzelius, that mathematics and astronomy absorbed at that time most of his interest. He wrote of his conversations with Flamsteed, Halley, and other well-known men of science, but his copious references to the works of Dryden, Spenser, Milton, Shakespeare, and others show that his scientific studies did not prevent him from becoming acquainted with the best English literature. Swedenborg spent nearly two years in London and Oxford. He afterwards visited Holland, France, and Germany, working all the time at a number of inventions. One of them was 'the plan of a certain ship which with its men was to go under the surface of the sea and do great damage to the fleet of the enemy.'[2] Another of his inventions was a magazine air-gun to discharge 60 or 70 shots in succession without reloading. He also devised a flying machine, but the great Swedish engineer, Christopher Polhem, expressed the opinion that, with respect to flying by artificial means, it was about the same thing as trying to make a *perpetuum mobile* or to make gold!

In 1716 Swedenborg was appointed by King Charles XII. extraordinary assessor at the Royal Board of Mines, an appointment which caused him to decline the offer of a professorship of astronomy in the University of Upsala. As the eldest son of his family, Swedenborg had a seat in the House of Nobles of the Swedish Parliament, but his interest in science, always greater than in politics, led him in 1721 to go abroad to study the mines and manufactures of other lands. It was during this journey that he published a treatise on physics and chemistry, at Amsterdam, a second edition of his *New Method of finding the Longitude*, at Leipzig, and *Miscellaneous Observations on Geology and Mineralogy*. But the work which won for Swedenborg a European reputation was his *Opera Philosophica et Mineralia* in 3 vols., with numerous copperplates, published at Dresden and Leipzig in 1734 at the expense of his patron, the Duke of Brunswick. In the first volume of that work, the *Principia*, Swedenborg gives an elaborate theory of the origin of the visible universe and propounds his nebular hypothesis. This theory has been often attributed to Kant and Laplace as the original authors, but Swedenborg's theory appeared in the *Principia* in 1734, while Kant's *Natural History of the Heavens* was published in 1755, and Laplace's *Système du Monde* in 1796, as has been shown by Arrhenius in his introduction to the Latin reprint of Swedenborg's *Cosmologia*. Soon after appeared the *Economy of the Animal Kingdom* (1740–41) and *The Animal Kingdom* (1744–45), in which are given the results of Swedenborg's extensive labours in anatomy and physiology. In 1745 his *Worship and Love of God* was published. This work marks the surprising transition of its author's mind from plain scientific and philosophical reasoning to what is generally considered a form of religious mysticism, but what the author himself would have described as spiritual perception. A great change had come over him. His mind, as he himself says, had been opened to enable him to hear and see things of the other life.

Swedenborg gives the year 1743 as the date of the opening of his spiritual sight, but it was in April 1745, according to his own statement, that he was fully admitted to intercourse with angels and spirits, not by any process analogous to what is usually termed spiritism (*q.v.*), but by speaking with them directly, while remaining normally conscious of everything about him on earth. He was quite aware of the scepticism with which such a mental state would be received, when made known to the world, and he anticipated it in his first theological work in these words: 'I am well aware that many persons will insist that it is impossible for any one to converse with spirits and angels during his life-time in the body; many will say that such intercourse must be mere fancy; some, that I have invented such relations in order to gain credit; whilst others will make other objections. For all these, however, I care not, since I have seen, heard and felt.'[1]

In 1747 Swedenborg resigned his position on the Royal Board of Mines and devoted himself to the new work to which he believed himself to have been divinely called. His vast work, the *Arcana Cœlestia*, was completed in 8 vols. in 1756. Then followed, among others, *The Earths in the Universe* (1758), *The New Jerusalem and its Heavenly Doctrine* (1758), *Heaven and Hell* (1758), perhaps the best known of all his books, *On the Intercourse between the Soul and the Body* (1769), *Divine Love and Wisdom* (1763), *Divine Providence* (1764), *The Apocalypse Revealed* (1766), *Conjugal Love* (1768), the first theological work to which Swedenborg's name is attached, and lastly *The True Christian Religion* (1771).

It is interesting, and in a sense very significant, to find that, while Swedenborg was fully occupied with the publication of so many theological works, he yet found time and freedom of mind to attend to mundane affairs. In 1763 he wrote several papers on scientific subjects in the *Transactions of the Royal Academy of Sciences of Stockholm*, and in 1766 he republished at Amsterdam his *New Method of finding the Longitude of Places on Land and Sea*. Count Höpken has stated that 'the most solid and best written memoirs at the Diet of 1761 on matters of finance were presented by Swedenborg.'[2]

The last political document bearing his signature is an address to the Diet entitled 'Frank Views concerning the Maintenance of the Country and the Preservation of its Freedom,' in which he utters a warning against the revival of an absolute monarchy.

On Christmas Eve, 1771, while in London, he had a stroke of apoplexy and was visited by the minister of the Swedish Church, E. Ferelius. He never completely recovered, and he died on 29th March 1772 in the eighty-fifth year of his age at his residence in Great Bath Street, Coldbath Fields, London. He was buried in the Swedish Church. In 1908 the Swedish Government, having made arrangements for the transfer of Swedenborg's remains to his native country, sent the frigate *Fulgia* to England to bring them home, and in due time they were deposited in the Cathedral of Upsala, close to the resting-place of Linnæus.

2. Doctrines.—The philosophical and theological doctrines professed by Swedenborg may be conveniently considered under three heads—God, the world, and man.

(*a*) *God.*—He has nowhere given any formal arguments to prove the existence of God. He starts at once from the conviction that 'all the principles of human reason unite and, as it were, concentre in this, that there is one God, the Creator of the Universe.' Two principles constitute the essence of God—love and wisdom. His infinity comprehends both immensity and eternity, His immensity having relation to space and His eternity to time. But God with respect to the created world is 'in space without space, and in time without time.' God is life, and all life is from Him. Life itself is uncreatable, but it can be communicated, lent, as it were, to finite beings. God is one absolutely in essence and in person. The Lord Jesus Christ is God, indeed, but He is not another divine person. He is Jahweh manifested in the finite garment of humanity. Yet in Him is a divine Trinity of love, wisdom, and power—the three essentials of His divine nature. Thus the Lord alone ought to be loved supremely and worshipped as our Heavenly Father. To see Him is to see the Father (Jn 12^{45} 14^{9}).

In a sense Swedenborg admits that God, in His essence, is unknowable, but he believes that there is a form of anthropomorphism which is not only permissible in speaking of God, but necessary, because it conveys a profound truth about Him. He asserts that our thinking in human symbols would be baseless and misleading if God Himself were not divinely human. Hence his startling postulate, 'God is a man.' Of course, he does not

[1] R. L. Tafel, *Documents concerning the Life and Character of Swedenborg*, 3 vols., London, 1875–77, i. 200–344 (Swedenborg's first letter from England to Benzelius, Oct. 1710).

[2] *Ib.* i. (Correspondence with Benzelius).

[1] *Arcana Cœlestia*, § 68.

[2] Tafel, ii. 408.

mean that God is a man in a physical sense. His real meaning is simply that, if we think at all about God, we must do so by means of symbols derived from our highest human experience. But, if these symbols do not correspond, in an infinite Reality, to what they represent, as finite symbols, to us, then all these conceptions are not merely imperfect and inadequate, but actually false. We are then obliged to conclude that there is a fundamental antinomy in the constitution of the human mind, so that the Power from whom it proceeds has so constructed it that it must think about that Power, and think about it falsely. Surely, Swedenborg considers, what the human mind *must* think should be, at least, an approximate symbol or representation of a fact. If we doubt this, the grounds upon which we believe any philosophical, ethical, or spiritual truth are undermined.

Thus, to think of God as a divine man would simply mean, for Swedenborg, to think of Him as being infinite love and wisdom, as He is apprehended by us by means of symbols derived from the highest of human faculties, the intellect and the will—those faculties by which we are made 'in the image of God.' But Swedenborg seems also to have discerned some profound connexion between this conception of God as a divine man in His essential nature and the rational interpretation of a possible incarnation in time. In reading Swedenborg it must always be remembered that there is an idealism, quite his own, at the basis of his philosophical views and consequently of his theology. This enables one to understand much that lies hidden behind his realistic language when he deals with spiritual matters for which our human vocabularies have only weak and inadequate expressions.

(*b*) *The world.*—This should be particularly remembered in his treatment of the creation of the world. Swedenborg has attempted to correlate two apparently irreconcilable ideas—the idea of a personal God distinct from the universe, and the idea of an immanent Creator. He has done it by means of his doctrine of 'discrete degrees.' He holds that there are substances of many orders composing the universe. The primary, self-existent substance is the infinite God from whom all finite substances originate. But those substances are related to each other in an order constituted by degrees named 'discrete degrees' in distinction from 'continuous degrees,' because they are plans of existence entirely separate from each other and incapable of being resolved one into another. A continuous degree is merely a variation of being or quality on its own plane, as from heavier to lighter, or from denser to rarer. It is only a question of more or less. Discrete degrees, on the other hand, are never of the same forms or qualities of being, and, moreover, they involve the relation of cause and effect. Hence Swedenborg says: 'Nothing, so far as I am aware, has hitherto been known of discrete degrees but only of continuous degrees; yet without a knowledge of both kinds of degrees nothing of cause can be truly known,' for 'seeing from effects alone is seeing from fallacies.'[1] He means that fallacies arise, not from a failure to distinguish between cause and effect, as, *e.g.*, between matter and spirit, but from the fact of regarding them as differing by continuous degrees only and not by discrete degrees. For thus cause is never lifted above the plane of effect, nor spirit above the plane of matter.

It is maintained therefore that in everything of which anything can be predicated there are what are called end, cause, and effect, and these three are to each other according to discrete degrees. In creation the natural or material world is the effect, of which the spiritual world is the cause, and God is the end. The first act of creation, not in time but in order, is the putting forth by the Divine of a finite emanation of love and wisdom from Himself. This is conceived as a spiritual sun of incomparable splendour, a manifestation so intense that the finite mind could not bear its ardour, were it not tempered by intermediate stages. Thus, successive discrete degrees, separated not in space but in the quality of their spiritual constitution, produce the higher and the lower heavens; other discrete degrees subsist in the angelic forms according to their receptibility of love and wisdom.

Similarly, the affections and thoughts which constitute the life of men are not, as it seems to us, self-generated, but pass into their minds out of the spiritual world, in a clearer or more obscure manner, always according to discrete degrees and in the order of cause and effect. In the world of matter a different law operates. Matter is derived not directly from spirit, but from the natural sun, which, according to Swedenborg, is not only the centre and support of our solar system, but also the proximate cause of its existence. From the activity of this primal sun are ultimately produced, by discrete degrees, the atmospheres and matter itself out of which the physical world is formed. The material substances, conceived as inert in themselves, are nevertheless capable of being acted upon by spiritual forces. But there is nothing of God in them as the ultimate of creation, since their life has ended in no-life, and love and wisdom have ended in forms of motion. Of course, this does not mean that God is not present in this ultimate of creation.

This doctrine is intended to exclude the incomprehensible idea of a creation *ex nihilo*, whilst it is meant also to provide against a pantheistic interpretation of the universe. It inevitably presents the difficulties which are inseparable from any theory of emanation.

(*c*) *Man.*—The theology of Swedenborg, as it deals with man, his nature, and his destiny, cannot be understood apart from his view (or, as he would insist, apart from the doctrine that he was divinely commissioned to make known to the modern world) of the real meaning of God's Word as we have it in the letter of Holy Scripture. More than 150 years ago Swedenborg had foreseen the difficulties and objections which criticism might bring forward as an argument against a belief in a divine revelation. 'It is in the mouth of all,' he says, 'that the Word is from God, is divinely inspired and therefore holy. But yet it has been unknown hitherto where within it its Divinity resides. The man who worships Nature instead of God may easily fall into error concerning the Word, and say within himself when he is reading it: "What is this? Is this divine? Can God who has infinite wisdom speak thus?"'[1] Yet Swedenborg never lost his faith in a divine revelation, and one of the principal objects of his theology is to show that the difficulties which create so serious a stumbling-block in many minds are due to the fact that they are looking in the Bible for what its letter does not and cannot explicitly manifest. He affirms that the Word contains throughout a spiritual meaning which alone gives the true and full sense of God's revelation to man.

Philo, Origen, Clement of Alexandria, and others have attempted to discover a spiritual sense in the Bible, but Swedenborg's conception proceeds on entirely different lines. For him the Word is the divine truth itself as it exists in God. It is the very form of God, and the medium of communication and conjunction with Him for the

[1] *Divine Love and Wisdom*, no. 187 f.

[1] *True Christian Religion*, no. 189.

angels in the heavens and for men upon earth. But truth in this divine form is utterly incomprehensible to any finite mind. To render it at least partly intelligible, it must descend through the discrete degrees already described, and assume successively lower and lower forms of expression adapted to the comprehension of the various grades of finite intelligence. On earth it presents itself to us as the letter of our Bible, or rather as the original texts from which that letter has come to us.

How then are those texts written? They are written in pure 'correspondences,' *i.e.* in symbols derived from nature. Every natural object is conceived to be the effect, and therefore the expression, of spiritual causes. Those effects 'correspond' to those causes; hence their capacity, when properly understood, to reveal the spiritual meaning contained in them.

The first result of this principle is that man is thus enabled to know the true canon of the sacred Scriptures. Those books which are so written as to present a correspondential spiritual meaning are really 'the Word.' The other books possess devotional and even doctrinal value, but they are not 'the Word.' Guided by this fact, Swedenborg declares that the only books of the Word in the Bible are, in the OT, the Pentateuch, Joshua, Judges, 1 and 2 Samuel, 1 and 2 Kings, the Psalms, and the Prophets from Isaiah to Malachi; in the NT, the four Gospels and Revelation. The Epistles form therefore no part of what Swedenborg strictly calls 'the Word.' But he valued them highly, and he frequently quotes them.

In the letter, as we have it, Swedenborg recognizes a human element manifested in the language and feelings of the writers of the various books of the Bible; it is only the spiritual sense that is entirely and solely divine. Hence many of the difficulties raised by the higher criticism would be no difficulties for him; *e.g.*, instead of a creation in six days in the book of Genesis, he reads there the earliest condition of man and the gradual development of his psychological constitution; his growth in a knowledge of good and truth, of love and faith, and of divine things; and finally his introduction to a celestial perception of divine truth itself. It is a conception of the regeneration of man, called to reach his spiritual destiny through knowledge, trial, faith, and love, and Swedenborg sees that such a conception has a sublime meaning for us which it could not have had for the men who lived when the letter was written. It would have been an unintelligible revelation for most of them. Therefore the full meaning of the letter as contained in the spiritual sense was not given to them. There is, according to Swedenborg, a grave spiritual danger in the premature disclosure to any mind of divine Truth.[1]

But what is man? He is, says Swedenborg, made to be at the same time in the spiritual world and in the natural world. He is not life, but a recipient of life from God. And God grants man a sense that the life which he feels within himself is his own, in order that he may live as of himself. In every man's soul there is an inmost or supreme degree into which the divine of the Lord proximately flows; hence it is that man can receive intelligence and wisdom and speak from reason, and from this also comes the fact that his soul is endowed with immortality.

The will rather than the understanding constitutes the man. Swedenborg rejects the idea of angels having been created as such to people the heavens. All spirits, he believes, whether in heaven or in hell, are from the human race. He also holds that there is no personal Devil or Satan, but that that name signifies the whole society of evil spirits.

The life of man cannot be changed after death, for the spirit of man is such as his love is, and infernal love cannot be changed into heavenly love, 'because they are opposite.'

The problem of evil, as presented by Swedenborg, is explained by the freedom with which God has endowed man, and it is because God 'who changeth not' will not withdraw that gift that man's love remains what it was even after death. If he has deliberately made evil his good and good his evil, then he is his own hell, and does not desire heaven. He could find no ease there, and would long for his congenial surroundings and associates. He is not sent to hell; he goes there of himself, and would be happy there, if an evil soul could find permanent happiness anywhere. But he inevitably meets with sufferings and punishments, inflicted not by God or His agents, but chiefly by the evil spirits his associates. What happens under our eyes here upon earth continues in hell. For evil breeds evil always and everywhere. This conception is sad, but certainly drawn from life.

Are then those sufferings eternal? It is difficult to interpret definitely the teaching of Swedenborg on that point. How far 'those sufferings may be mitigated,' says Howard Spalding, 'we are not told, but a careful study of all that Swedenborg has said on the subject suggests that they may be so greatly modified as to cease to be acutely felt.'[1] It is remarkable that, according to Swedenborg, there is no absolute destruction of evil even in heaven, for nothing which has formed part of the spiritual nature of man can ever be annihilated. Spirits therefore—yea, angelic spirits—carry with them into heaven the perverted organic forms in which their evils resided. They are even permitted to experience from time to time a sense of their evils, but not uselessly, for by those alternations of state spirits are kept in continual spiritual progress. Thus the regeneration of man, begun on earth, continues to eternity.

Of heaven we are told that God Himself is heaven, and that His presence to each human spirit brings heaven into him, but always in a degree which depends on a certain faculty of reception acquired on earth by man's conscientious endeavour to make what he truly believes the rule of his life.[2]

There has been a tendency, more or less defined, to class Swedenborg among the mystics, but this seems to be due to an imperfect understanding of his system. His conception of life in heaven should suffice to show how little he has in common with mysticism past or present.

The fulfilment of God's purpose in creating the world is a fundamental doctrine in Swedenborg's theology. That purpose, we are told, was, by making man in His own image and endowing him with the faculties of freedom and rationality, to prepare him for that conjunction with God which constitutes the angelic heaven. In this sense, the creation means infinite love seeking by love to cause love to arise freely between the Creator and His rational creature. But the misuse of rationality and freedom has led to evil being chosen and loved instead of good; hence sin, whose effect is the weakening of true freedom, and the obscuring of that interior light within us which is rationality. Then it is that the love which had created man has also come to save him. By His incarnation the Lord did not come to reconcile His Father

[1] See *Arc. Cœlest.* no. 3398.

[2] For full details see especially Swedenborg's *Heaven and Hell.*

to man, for God in Christ, as Swedenborg says, is the one only God who is love itself and does not need to be reconciled to His creature. It is man who needs to be reconciled to God. The Lord came and, as to His human nature, was born, lived, suffered, and died 'for us,' not 'instead of us.' He came to enable man to do that which, through sin, he had almost lost all power of doing, namely, to shun evil and to do the Lord's will in a life of righteousness and true holiness. Moreover, God 'became flesh,' not only to effect this work of redemption, but also that He might visibly manifest His infinite love for man, and thereby give to him for ever a definite object of intelligent faith, worship, and love. Man is said to be saved by the blood of Christ, in this sense, that His blood is the symbol of divine truth, and the shedding of His blood is the symbol of the imparting of His spirit of truth, the Holy Spirit. The Atonement, for Swedenborg, is thus really an at-one-ment, the reconciliation of man to God by the love and power of God. It was accomplished by the Lord taking upon Himself man's nature, enslaved by sin, from the Blessed Virgin Mary, sustaining in His own person the assaults and temptations of the powers of darkness, and gradually subduing them. For this work the Lord laid down His life, *i.e.* the life in Him of all that was not in perfect agreement with the infinite perfections of His indwelling divinity. When this was done, 'consummated,' the Lord Jesus Christ was no longer, even as to His human nature, the Son of Mary. He was the 'only begotten Son of God,' the perfect manifestation of the infinite, invisible Father. This process, called glorification, was completed after His resurrection, when the Lord 'put off' from the infirm human nature all its hereditary tendencies to evil and sin, and 'put on' from the Father the divine humanity subsisting in the essential divinity within Him. This is the supreme type of man's own regeneration by which, having put off hereditary tendencies to evil and his actual sins, he puts on from the Lord, in the degree that he has thus put off evil, a new regenerated and spiritual humanity, a spiritual mind. No real regeneration can be attained except in accordance with the principle that a 'saving faith' is 'a faith which worketh by love.' Salvation by 'faith alone' is rejected and condemned by Swedenborg in innumerable passages in his works.

It is important in connexion with this subject to understand his idea of 'the Church.' The essential Church for him is constituted by a genuine love of goodness and truth and by the spiritual relation established with the Lord in the minds of men. The true Church is therefore invisible, but, so far as it is a true Church, it can never pass away. This, however, does not exclude the possibility of the disclosure by the Lord of further truths called for by new conditions in the world of human thought and experience, and needed to establish a higher level of spiritual life. Nor does it exclude the possibility of the loss or the corruption of truths previously held, rendering necessary the institution of a specific 'New Church' in order to restore what has been lost, and to incorporate new truths which the Church in the past was not ready to receive. The assertion, therefore, made by the disciples of Swedenborg that a 'New Church' has been instituted, involves, as they would insist, no disparagement of the former Christian Church 'so far as it is really the Lord's.' The members of the 'New Church' at the present time consider it an entire misconception to imagine that Swedenborg is the founder of a 'New Church.' He himself always repudiated any such pretension. He considered himself a mere instrument through whom new truths needed in the Church were communicated to the world. His chief point always is, however, that 'the Church is one thing and religion is another.' The Church is called a Church from doctrine; religion is called religion from a life according to doctrine. Hence his well-known saying: 'All religion is related to life, and the life of religion is to do Good.'

L. B. DE BEAUMONT.

SWINE.—The swine plays a prominent part in many ancient and modern religions. The word 'pig' is unlucky to the Scottish fisherman, and on hearing it he will feel for the nails in his boots and mutter 'Cauld iron.'[1] The inhabitants of certain villages on the north-east coast of Scotland consider the words 'sow,' 'pig,' and 'swine' very unlucky; should any one be so unwise as to utter these words while the line is being baited, the line will surely be lost. The Galelareese, having noticed that, whilst men suffer from itch, caused by treading on the fallen fruit of the *aren* palm-tree, the wild boar, which is fond of the fruit and runs freely among it, is not liable to such a disease, argue that the fruit treats the pig as a real friend, and, if one by grunting can impress the fruit that he is a pig, it will treat him in the same way.[2] The pig was offered by the Romans and Greeks as an expiatory sacrifice. Cato advises that, before thinning a grove, the Roman farmer should offer a pig to the god or goddess of the place.[3] The grain distributed as prizes in the Eleusinian games in Greece was grown on the Rarian plain near Eleusis; this plain was so sacred that no dead body was allowed to touch it, and, whenever a defilement occurred, a pig was offered as a sacrifice. The Caribs abstained from pig's flesh because, like most primitive races, they believed that the physical and mental qualities of the human being depend largely upon the food which he eats; therefore, if they were to eat the flesh of pigs, they would have small eyes like those of a pig. Similarly Zulu girls abstain from eating pig's flesh because they fear that by eating it they might gradually come to resemble the ugly pig in appearance. But there are other reasons why primitive man abstained from pork. The Kai of N.E. New Guinea find that pigs are the worst enemies of the crops; therefore, if a field-labourer were to eat pork, the dead pig in his stomach would attract the living pig into the field.[4] Swine's flesh was forbidden to all the Semites except the Babylonians, but it is an open question whether this was because the animal was holy or because it was unclean.[5] As early as the time of Ḥammurabi pork was a highly valued food among the Babylonians and frequently formed part of the temple offering. the inspection of pigs various omens were derived, and in the official lists special provision is even made for the temple pigs. The heathen Harranians sacrificed swine's flesh once a year and ate the flesh.[1] By the Syrians the swine was regarded as sacrosanct, and it was specially sacred to Aphrodite.[2] To the Greeks the attitude of the Jews towards swine was difficult to understand.[3] In Is 65^4 $66^{3.\ 17}$ we are told that some of the Jews used to meet secretly to eat swine's flesh; it has been suggested therefore that 'the swine was revered rather than abhorred by the Israelites,'[4] and that it was not eaten because it was divine. To the Egyptians the pig was very loathsome.[5] Swineherds were forbidden to enter a temple and even had to marry among themselves. If a man even touched a pig, he immediately stepped into a river to wash off the taint. Pig's milk caused leprosy. These prohibitions prove that the Egyptians originally regarded the pig as sacred, for the belief that the eating of a sacred animal produces leprosy and that the effect caused by touching a sacred object is removed by washing was current among many ancient tribes and religions.[6] Later, however, the pig began to be looked upon with horror and was regarded as the Egyptian devil and the embodiment of Set or Typhon and enemy of Osiris. Typhon, in the form of a pig, injured the eye of Horus, who burned him and ordained that a pig was to be sacrificed, seeing that Ra, the sun-god, had declared the pig to be an abominable beast. We find in various religions that the animal sacrificed to a god because he is the god's enemy was originally the god himself. Now, we read that Typhon was hunting a boar when he discovered and mangled the body of Osiris, and that for this reason pigs were sacrificed once a year. It has therefore been suggested that originally the pig was a god, and that he was no other than Osiris.[7] We have already seen that the Kai of New Guinea abstain from pork because they regard the pig as the enemy of the crops, so that we can understand why the Egyptians should have identified their corn-god Osiris or his enemy Typhon with a wild boar. It might also be noted that pigs were sacrificed to Osiris on the very day on which he is recorded by tradition to have been killed. Further, the pig was sacred to the corn-goddess Demeter and was often associated with her. In art she is represented as accompanied by a pig.[8] At the Thesmophoria it was customary to throw pigs into some sacred vaults, which are described as the 'caves of Demeter and Persephone.'[9] It seems that the pigs were intended to represent Persephone and her descent into the lower world. An ancient legend tells that, when Pluto carried off Persephone, Eubuleus, a swineherd, was herding his swine near the spot, and his herd were engulfed in the cave into which Pluto and Persephone had vanished. The Thesmophoria has analogies in the folk-customs of N. Europe. In certain districts of Courland the pig is the corn-spirit, whose power of fertility lies in his tail; therefore, when barley is sown for the first time in the year, the sower sticks a pig's tail into the field, believing that the ears of corn will grow as long as the tail.[1] The idea that the pig is an embodiment of the corn-spirit can further be seen from the Scandinavian custom of 'Yule boar.' This is a loaf prepared from the last sheaf in the form of a pig. It is usually prepared at Christmas and kept till sowing-time, when it is given to the plough-horses in the hope that it will be the means of securing a good harvest.[2] In this connexion it is of interest to note that Ball finds a philological connexion between Tammuz, the Assyrian god of the under world and of vegetation, and the Chinese and Turkish words for pig. He also cites the evidence of classical writers[3] that 'the Jews did not use swine's flesh because it was sacred inasmuch as by turning up the earth with its snout it taught men the art of ploughing.'[4] In some parts of White Russia it is believed that the bones of a pig preserve the corn from hail, whilst in other places the ribs are thrown into the seed-bag among the flax-seed because they cause the flax to grow well and tall. The Alfoors of Minahassa in N. Celebes believe that a pig's blood causes inspiration, and at one of their festivals the priest drinks a pig's blood and thereupon is able to prophesy as to how the rice-crop will turn out.[5] The inhabitants of Car Nicobar rub themselves over with pig's blood in order to cleanse themselves of any devils of which they may be possessed.[6] In the same way the Greeks cleansed a homicide by sprinkling him with pig's blood and beating him with a laurel bough. The Karens of Burma believe that a bad harvest is caused by adultery, and, in order to atone for this, those detected in adultery must buy a pig, scrape out furrows in the ground with each foot, and then fill them with the pig's blood.[7] Some Yabim believe that after death their souls will be turned into swine, and they therefore abstain from swine-flesh lest they should thus be eating the souls of their relatives. The people of Tamara (off the coast of New Guinea) also abstain from pork because the souls of the dead transmigrate into the bodies of pigs. The worshippers of Adonis did not eat pork because their god had been killed by a boar. It has been suggested that the cry '*Hyes Attis!*', raised by the worshippers of Attis, meant 'Pig Attis!'[8] In Fiji a huge pig is presented to those who are initiated into manhood. At Maewo, in Aurora, one of the New Hebrides, fifty days after the death of a wealthy man pigs are killed, and the point of the liver of each pig is cut off. The brother of the deceased goes to the forest and calls out the dead man's name, saying 'This is for thee to eat,' the idea being that, if pigs are not killed for the benefit of the dead man, his ghost has not proper existence.[9] It should be noted also that the pig is very often represented by a cowry-shell. account of the natives of Malu Island, off the coast of New Guinea,[1] says that at one of their feasts the natives erect a gallows and ornament it with a white shell called *moto* (the so-called white cowry, *Ovulum ovum*). This shows that they are about to offer pigs for sacrifice, and the number of pigs to be sacrificed is always the same as the number of shells. The association of this shell with pigs is important when it is remembered that cowries are widely known as pig-shells. This fact, and also the passionate tendencies of swine, would be the most plausible explanation of the abhorrence with which they have always been, and still are, regarded in the East.

SYMBOLISM (Christian).—It is proposed in this article to indicate the more important of the emblems and personifications in which Christian belief has found spontaneous expression. The literary images which deserve to be called symbolical, but which have not embodied themselves in pictorial or material shapes, are excluded from view. An attempt will be made, however, to connect the emblems which call for notice with the language of the New Testament.

When the subject is thus defined, the field to be surveyed is at once seen to admit of a clear division. The first four or five Christian centuries separate themselves for our purpose markedly from the centuries which follow. For the symbolism of the earlier period we have the definite and varied testimony offered by the sepulchral paintings and inscriptions of the Roman catacombs. With the light thus obtainable we are able to see the hopes with which the Christians of Rome during this formative period followed their dead into the unseen world and connected the life that now is with that to which they believed it to be the portal.

Burial in the catacombs and the symbolism to which it gave rise practically ceased before the middle of the 5th century. From that time onwards new images and ideas crowd in upon us, created by the popular imagination in response to the Church's teaching and worship, to legends of the saints, animal fables, and spiritual plays and moralities. Many of these images do not succeed in finding an emblematic expression, but those which do create a symbolism far exceeding that of the previous period in amplitude. We shall give our chief attention to the earlier period, and briefly indicate the later emblems which, either from their permanence or from their inherent significance, seem especially to claim notice.

A review of the entire field brings one decisive feature of the symbolism into prominence. The emblems will all be found to point onwards to a life beyond the tomb. The symbolism is created by a hope or, it may be, a fear whose fulfilment is not expected within the limits of our present existence. The justification of this 'other-worldliness' may readily be found in our records of the life of Christ. His ministry began with the announcement, 'The kingdom of God is at hand,' and was throughout a prophecy of good things to come (Mk 1^{15}). Some of His disciples may at first have believed that they would see these good things before they 'tasted' death (9^{1}). The mere lapse of time was enough to stamp such expectation with the mark of illusion. Every year it became more clear that the realization of the promised kingdom must needs be a slow and gradual process. In another respect also the desired consummation underwent a change. The earth ceased to be regarded, as perhaps it had at first been, as the scene of fruition. The liveliest hope cannot resist the accumulating contradictions of continuous experience. Year by year it became less likely that the kingdom could ever be localized or assume any material shape. The Crucifixion and its sequel had lifted the thoughts of the disciples from the earth and carried them into that heaven which had now become the Master's home. To this heaven they transferred their 'treasure' (Mt 6^{19}), less perhaps from deliberate apostasy than from the reluctant acceptance of undeniable experience, and to it their hearts ascended. Death thus reassumed its normal character, and what lay beyond it became an object of anxious thought or fervent longing. These thoughts and longings form the central motives of Christian symbolism. The blessedness hoped for after death, the means by which it may be reached, and the character of Him who procured and guarantees it—these will be found to be the subjects round which the Christian emblems of all periods gather. From the beginning hope has been the dominant Christian characteristic. The scene of fulfilment and the mode of realization may have shifted. Hope itself has remained.

The symbolism of the catacombs embodies the hopes of future blessedness entertained by those who used these burying-places up to the time when such subterranean burial ceased. Thus the roses, or flowery meadows and shrubs, which appear on so many tombs represent paradise. Its entrance is sometimes indicated by a curtain which is in process of being drawn aside. The Good Shepherd who appears on tomb after tomb may with greatest probability be here regarded as the Lord and Protector of the dead. It is they whom He gathers round Him in the heavenly fields. One of their number is the sheep He carries on His shoulders. The fish, one of the two articles of food with which the thousands were fed (Jn 6^{1-14}), represents the mystical union with Christ, and its fruit incorruptibility (*ἀφθαρσία*). The vine points to the heavenly feast, or to its earthly pledge—the Eucharist. The dove, sipping water from the basin or jar, is the soul refreshing itself from the water of life (Rev 22^{1}). The palms symbolize either the palms borne by the blessed (7^{9}) or the wreaths or crowns of those who have been victorious in the race of life (1 Co 9^{25}, 2 Ti 4^{8}). The anchor indicates the hope of He 6^{19} which enters in 'within the veil.' The ship and lighthouse typify the dangerous voyage across the ocean of life to the haven of safety. The stag is that of Ps 42^{1}, and represents the soul's thirst for God.

The paintings of the catacombs have been fully described by two recent writers. Wilpert, in his *Malereien der Katakomben Roms*, has classified the paintings, reproducing all that are important and giving his interpretations of their symbolism. Von Sybel, in his *Christliche Antike*, has reviewed the subject on the ground provided by his predecessor's labours. He also reproduces many of the paintings and states his own conclusions in a lucid style and with much wealth of learning.

The symbolism of the later centuries has the

[1] *Trans. and Proc. Royal Soc. S. Australia*, xxxix. [1915] 494 f.

same general character. As sin and misery increase on the earth, fear plays a larger part in the Church's symbolism. The torments of the lost become more conspicuous than the joys of the blessed. A final judgment of all mankind displaces the earlier individual judgment and assumes truly terrifying aspects. The figure of Christ becomes more stern and awful, and, as it does so, the person of the Virgin Mother takes His place as Protector and Advocate.[1] She is invested with steadily-growing dignity and is separated more and more from human infirmity. The Church becomes a figure of regal authority. In what has been said[2] to be 'perhaps the finest mediæval personification'—the sculpture on Strassburg Cathedral — she appears as a royal lady, with the crown upon her head and the banner of victory and the chalice in her hand. Elsewhere Christ is seen crowning her from the Cross, or she receives His blood in her chalice. Thus, whether in earlier or in later art, the symbolism alike points beyond the tomb.

We may now proceed to deal in greater detail with the separate symbols. They will be found to gather, for the most part, round two central subjects: (1) Christ, regarded as the author of eternal life, and (2) the heavenly state.

1. The author of eternal life.—Christ is represented in all our Gospels as the giver of eternal life to those who accept and follow Him. The synoptists amply confirm His declaration in the Fourth Gospel: 'He that heareth my word, and believeth him that sent me, hath eternal life, and cometh not into judgement, but hath passed out of death into life' (Jn 5^{24}; cf. Mt $10^{32f.\ 39}$ 19^{29}, Lk $9^{24.\ 26}$, etc.). There can be no doubt that, whatever the Kingdom of God may have meant to the first Jewish disciples, it represented an inseparable association with Christ, here and hereafter, as Master and Saviour. To the Gentile world Christ, we may safely say, appeared as, above all else, a deliverer from the power of death. He had taken flesh that 'through death he might . . . deliver all them who through fear of death were all their lifetime subject to bondage' (He 2^{14}). He had 'abolished death, and brought life and incorruption to light through the gospel' (2 Ti 1^{10}). These and similar passages were probably understood by the earliest believers much as they are by ordinary Christians to-day. They were taken to mean that the faithful disciple would find Christ waiting for him, when death was past, and that Christ would then lead him into a better and happier existence than he had hitherto known, better and happier because it was nearer to God. Christians generally would not perplex themselves then, any more than they do now, with questions regarding the precise nature or locality of this future existence. The 'eternal life' which in the Fourth Gospel is the equivalent of Messianic blessedness was probably understood by the great majority of readers as a life in which the disciple would 'see' God, and which would not come to an end as earthly life does. Far as this is from exhausting the meaning of the word 'eternal,' it is difficult to suppose that the word can ever have conveyed, or does even now convey, to the ordinary Christian more than this simple interpretation. Of this better life, to be known hereafter, Christ had given a foretaste or prophecy during His earthly ministry. The blind then received their sight, the lame walked, the lepers were cleansed, the deaf heard, the dead were raised, and the poor had good tidings preached to them (Mt 11^{5}). It is this power of God to save from death and harm that finds expression in the paintings of the catacombs. Christ appears as the son of God foretold by prophetic voices. His ministry has been heralded by many previous displays of God's saving power. He has actually shown Himself to be the raiser of the dead, the restorer of the blind, and the healer of the sick. He waits for His disciples beyond death to lead them into the heavenly pastures. Such are the subjects and implications of the symbolism.

(*a*) *OT types.*—Scenes from the OT which were especially held to typify this deliverance recur with great frequency on the tombs. These are the salvation of Isaac, when he was about to be slain in sacrifice by Abraham, the salvation of Noah in the Ark, the restoration of Job to his former prosperity (Job $42^{10.\ 12}$), the rescue of Jonah from the jaws of the sea-monster, and the preservation of the three Hebrew youths in the flaming furnace. Some features in the symbolism of these paintings deserve particularly to be noted. In the representations of Abraham's contemplated sacrifice it is the rescue of Isaac from death that the painter desires to symbolize. This is plain from the attitude in which Isaac is represented when the design of the picture permits. He appears with extended arms—a posture of prayer or adoration of which more is said below. This is also the attitude of Noah as he stands in the Ark, and of the three children in the furnace. There is no suggestion in the paintings of the theological meanings afterwards found in Abraham's projected sacrifice. It may also be observed that the Deity is represented here, as generally or often in the earliest Christian art, by an outstretched hand. No attempt is made to delineate His features. There are no representations of the Trinity such as we find afterwards. Of all Biblical types Jonah has been the most frequently chosen by these painters. He forms the subject of 129 separate pictures which have come to light. It is to be observed that he does not here appear as a type of the resurrection of Christ, as he does in Mt 12^{40}. Nor is it the repentance of the Ninevites at his preaching (Mt 12^{41}) that the painters wish to symbolize. He is represented as an example of God's saving power. Sometimes he forms the subject of three or four connected pictures. We first see him standing on the deck of the vessel and about to be cast into the sea. We then see the monster vomiting him out towards the land. He next appears resting under the gourd, which takes the form of an arbour like those in paradise. There may be a fourth picture where he reclines in an attitude of dejection, his head resting on his hand.[1]

(*b*) *The sacred infancy.*—The divine childhood is depicted on a number of tombs. One of the most beautiful paintings in the catacombs[2] is the picture in the Priscilla cemetery of the Christ-child on His mother's breast. The mother bends slightly forward as if to suckle the child. The child's hand is spread out over the mother's breast, but the face, with wonderful eyes, is half turned towards the spectator. Above the heads of mother and child two stars are indicated in an oblique direction. To the left stands a man in mantle and sandals who has in his left hand a written roll and with his right points to the star above. This figure probably represents, not Joseph (who, as far as is known, does not appear in early Christian art), but a prophet, either Isaiah, who pointed to the light of the Messianic age (60^{1-6}), or Balaam (Nu 24^{17}, Rev 22^{16}), who told of the star to arise out of Jacob. If this identification be correct, it is, as von Sybel says,[3] 'one more evidence that at least the earlier Catacomb painting was in no sense historical, but entirely symbolical art.' The picture belongs to the beginning of the 2nd century.

Another incident of the sacred infancy frequently

[1] See art. 'Mary,' in *HDB*.
Schulze art. 'Sinnbilder,' in *PRE*[3] xviii. 392.

[1] Von Sybel, p. 216 ff.
[2] *Ib.* p. 247.
[3] *Ib.* p. 249.

depicted is the visit of the Magi. They are generally represented as three in number, although the painter may be led by the exigencies of space to increase them to four or reduce them to two.

'The definite determination of their number as three, their designation as kings, the ascription to them of proper names (Kaspar, Melchior, Balthasar), the differentiation of their ages —to this legendary web antiquity only contributed the first threads. Its elaboration was the work of the Middle Ages.'[1]

The Annunciation (Lk $1^{26ff.}$) forms the subject of two paintings, one belonging to the end of the 2nd and the other to the 3rd century.[2] Mary is seated. The angel, in the form of a man, makes the announcement standing, as a visitor who has just entered the house. The relative postures of the two figures can be explained without the supposition of an intention to claim for Mary a higher dignity than for the angel. The two paintings may presuppose, but cannot be held to go beyond, the Gospel narratives.

On the other hand, Mary's perpetual virginity finds constant expression in mediæval art. The OT provides many images of inviolability which are applied to Mary. She is the 'fons signatus,' the 'hortus conclusus,' and the 'turris' of the Song of Solomon (4^{15} 4^{12} 4^{4}). The christianized *Physiologus*—a mediæval bestiary or book of animals, real and fabulous, with allegorical explanations[3]—supplied the legend of the unicorn, a fabulous animal which could be tamed only by being caught in the lap of a pure virgin. Ezk 44^{2} provided the symbol of the barred door, Jg 6^{37} that of Gideon's fleece watered by the dew from heaven. The number and variety of these symbols show the value assigned to the doctrine of Mary's perpetual virginity by the mediæval Church.[4]

(*c*) *The Divine Healer.*—The Gospel miracles, of which there are numerous representations in the catacombs, are evidences of God's desire to release humanity from its plagues. In the heavenly city of the Apocalypse there was to be neither sorrow nor death (Rev 21^{4}). To this divine purpose the healings of Christ bore emphatic witness. His ministry was a short-lived anticipation of the Messianic Age (Mt $11^{4ff.}$). The beneficent power, then displayed in a few instances, would hereafter be seen in the fullness of its strength. It is an evidence of the authority rapidly acquired by the Fourth Gospel that the miracle most frequently represented in the catacombs is the raising of Lazarus (50 examples have been discovered). We remember how both the sisters greet the Saviour with the words, 'If thou hadst been here, my brother had not died' (Jn $11^{21.\ 32}$). We are intended to regard the presence of Christ as incompatible with death, or at least with its bereaving power. Other healings which may with certainty be identified are that of the paralytic (Mk $2^{1ff.}$ and ||), where the man appears walking with his bed on his shoulder, and that of the blind man, where we see Christ touching with His finger the man's closed eyes. Another unmistakable scene is the cure of the issue of blood (Mk 5^{25} and ||). The woman comes behind the Saviour as He walks with two disciples, and kneels that she may touch the hem of His robe. Other paintings have no distinctive features which would justify certain identification.

(*d*) *The Cross.*—The absence from the earlier catacombs of what has now become the distinctive Christian emblem is full of significance. The use of the cross as a separate symbol appears to date from the campaign of Constantine against Maxentius (A.D. 312), when Constantine put the cross upon the shields of his soldiers. Previous to this date we find the cross mentioned in one inscription in the catacombs, and appearing doubtfully in two ceiling-paintings. Both inscription and paintings belong to the 2nd century. The monogram of Christ (*e.g.*, ,) appears in inscriptions of which some may possibly be anterior to Constantine, but its general use dates from the reign of this emperor. It has accordingly become customary to regard both the cross and the monogram as indicating a date not earlier than the 4th century. It should also be observed that the only known reference to the Passion in the catacombs previous to the 4th cent. is what is believed to be a representation of the crowning with thorns in the Pretextatus cemetery.[1] The absence of any symbol of the Passion from the earlier tombs may readily be accounted for by the fact that their paintings were intended to display, not death, but the victory over death. Even when the cross does begin to appear, it seems to be introduced, not for its own sake, but as a support for the rose-leaves which gather round it. It thus becomes a beautified or transfigured cross. We are reminded of the symbolism of the Passion-narrative in the Fourth Gospel, where we see Christ reigning with sovereign authority from the Cross, and the majesty of the Divine Sufferer shining through the indignities which strive in vain to obscure it. The foliage-crosses of the catacombs—concealed or 'dissimulated' crosses—have indeed been traced to the supposed desire of the Christians to avoid observation. Apart, however, from the fact that such crosses do not begin to appear until the 4th cent., it is difficult to believe that the other emblems which do appear would not have clearly indicated these vaults as Christian burying-places. It seems more natural to suppose that the transfiguration of the Cross effected by St. Paul's theology required much reflexion before it could find emblematic expression. The Cross was at first a stumbling-block (Gal 5^{11}) and only slowly became a symbol of glory (6^{14}).[2]

It will thus have been observed that the earliest representations of the Passion were avowed symbols, suggesting, but not depicting, the sacrifice of the God-man. Realism becomes more pronounced as we travel down the centuries. The crucifix—an inevitable development of the cross—does not appear in churches till after the 7th century.[3] The implements of the Passion (hammer, claws, etc.) become independent emblems towards the end of the Middle Ages, when indulgences began to be attached to their veneration. The lamb with blood streaming from its breast, and carrying the cross or a banner upon which the cross was depicted, became a favourite symbol on the portals of Latin churches. The pelican (taken from the *Physiologus*), who tears open its breast to feed its young, was used to represent the sacrificial death of Christ.[4]

(*e*) *The Good Shepherd.*—The favourite symbol of Christ among those who constructed and used the catacombs was that of the Good Shepherd. This image takes here the place of the crucifix in later art. It appears in two different forms in the Gospels. In Lk 15^{3-7} the shepherd is seen bringing home on his shoulders, 'rejoicing,' a sheep that has been lost. In Jn 10^{1-17} the shepherd leads his sheep to and from the pastures and protects them

from the wolf, even at the price of his own life. It is added by Christ in a subsequent verse (v.[27f.]): 'My sheep hear my voice, and I know them, and they follow me: and I give unto them eternal life; and they shall never perish, and no one shall snatch them out of my hand.' Both representations are of frequent occurrence on the tombs. We see the shepherd pasturing his flock, and carrying upon his shoulders a sheep, whose legs he clasps sometimes with one and sometimes with both hands. There seems to be little doubt that this favourite symbol, like the others in the catacombs, is intended to transport the mind beyond death. The painters wished to indicate the power of Christ over death. Those who died, no less than those who lived, were under His protection, 'the sheep of his pasture.' Thus, where a landscape is indicated in the paintings it is invariably that of the garden or park which typifies paradise. The image, so understood, would appear to have passed into the early burial prayers of both the Greek and the Latin liturgies.[1] Thus, when A. P. Stanley[2] points to the frequent image of the Good Shepherd as an evidence of the joyousness of early Christian feeling, we must remember that the sheep in these pictures are in all probability those who have passed from the vicissitudes of the world into the safe haven of eternal rest.

A brief reference may here be made to the emblems which early Christian art adopted from Greek and Roman mythology. We cannot measure the precise significance which these emblems possessed for the Christians who used or looked at them. They may have been little more than the current decorations of the period; or they may have had a distinct didactic purpose, and been intended to suggest that Christ was the reality to which the heathen mythology pointed in unconscious and hesitating prophecy. So Eros and Psyche appear in many of the catacomb paintings, and in five different pictures where we should have expected the Good Shepherd we find Orpheus with his lyre.

(*f*) *The Judge of the dead.*—In some paintings Christ is seen seated upon a raised platform, plainly in the character of Judge. In one of these[3] we see a male figure in the posture of an *orans* between two taller forms, who point to him as if they were his introducers or sponsors. In the background upon a raised pedestal is Christ, who stretches His open right hand over the head of the middle figure, while in His left He holds a roll. In Wilpert's opinion, the middle figure represents one of the dead who has already stood before the judgment-seat of Christ, while the two other figures represent his advocates.

These representations of judgment convey some important suggestions. The face of Christ in the picture described above is grave without being stern. It must be remembered that no authentic likeness of Christ appears to have been preserved by His disciples. The varieties given to His face and figure from the earliest times put this beyond reasonable doubt. Irenæus[4] shows that no trustworthy portrait existed in his day. To the same effect are the words of Augustine.[5] The disciples were thus left to their own insight and skill to depict His likeness. The painters of the catacombs seem to have given Him the typical male head of their time. This type was during the first two centuries a beardless face with the hair closely cut. It was followed in the 3rd cent. by a face, still beardless, but surrounded by long hair falling upon the forehead and down the back. A still later type was a bearded face framed in flowing or curling locks. If the painters were guided by the prevalent fashions of wearing the hair and beard, it is obvious that we cannot infer much from the apparently increasing seriousness of the countenance.[1] The growth of asceticism in subsequent ages had a marked influence. The early effort after beauty was abandoned. Manly beauty was associated in the mind of the monastic Church only with barbarian soldiers. The words of Is 53[2], 'There is no beauty that we should desire him,' shaped the artist's conceptions. The figure of Christ in the Church of Galla Placidia in Ravenna (*c.* A.D. 450), when compared with the portrait to be seen in the Church of Apollinaris in the same city, painted about a century later, shows the transition from the earlier ideal, shaped by the love of beauty, to the ascetic or melancholy conceptions of later art.[2]

These representations seem also to make it plain that the judgment symbolized was individual and thought of as taking place immediately after death. The departed appears at once before the judgment-seat of Christ (2 Co 5[10]). The approving sentence of the Judge is the signal for his immediate entrance into paradise. Thus in one painting[3] we see two figures, one on either side, drawing back a curtain to admit into paradise one of the departed, who stands in the centre in the posture of an *orans*. In another painting two of the blessed move eagerly forward to welcome a new arrival, who advances in the same attitude of devotion. We find no representation in the catacombs of a general judgment of mankind. Nor do the paintings, as archæologists of all schools agree, give any indication of belief in an 'intermediate state' or a period between death and judgment. All those who die in Christ are conceived as passing at once from their death-beds into heaven.[4]

When we pass into the subsequent centuries, death and judgment assume terrifying shapes. The destructive power of death is symbolized by a man who weeds the garden of life or fells its trees, or (after Rev 6[8]) as a rider with drawn bow, above all as an emaciated old man who finally reaches the form of a skeleton with scythe and hour-glass. 'The dance of death' appears to have originated in the plague known as 'the Black Death.' It quickly gained a wide popularity, which it retained far beyond the Middle Ages. The soul, leaving the body, was regularly represented as a little human figure, naked and sexless, emerging from the mouth. In pictures of the Last Judgment popular imaginations of hell took the place of the earlier representations of paradise. Hell was symbolized by the open throat of a monster (after the leviathan of Job 41), into which men and women, masters and servants, priests and people, were thrust. Devils in every shape did their work of derision and torture under the supervision of the prince of hell. To him the popular imagination transferred everything it knew of monsters, and thus there arose the being of many shapes and names with goat's horns, cloven hoof, bat's wings, and a tail. He even took the form of a blackbird, and, as such, flew into the mouth of Judas at the Last Supper, and whispered into the ear of Pilate as he sat in judgment. Popular humour may well have had its share in shaping these fancies.[5]

2. **The heavenly state.** — St. Paul represents Christ as the second Adam, who undid the consequences of the first Adam's transgression (Ro 5). By the early Christians heaven was pictured as a restored Eden. The word 'paradise' appears to

have been originally Persian and to have been introduced into Greek literature by Xenophon.[1] The Greeks seem to have passed it on to the Hebrews. It appears in the OT only in writings subsequent to the Greek period (Ec 2^5, Ca 4^{13}, Neh 2^8), and bore the meaning of a park with trees, shrubs, and grass, and tenanted by wild animals, such as surrounded the residences of eastern potentates. Such parks were commonly enclosed by a wall or trellis-shaped fence. Trees, shrubs, flowers, and the trellised fencing in the catacomb paintings are invariably symbols of paradise.[2]

On the threshold we meet with the figures known as *orantes*. These are forms, male or female—the latter are much more numerous than the former—standing with arms either fully extended or bent at the elbows, and with opened hands. The *orantes* give rise to questions which are still in debate. Whom, in the first place, are these figures intended to represent? Against the supposition that they are either likenesses of the departed or intended to represent their souls[3] we have to place the fact that a female *orans* often appears painted on the tomb of a man, and also to remember that the paintings appear to have been sometimes executed before the tombs were filled. It seems therefore most natural to regard the *orantes* as ideal figures, poetic representations of the blessed dead. Again, what is the meaning of the outstretched arms and open hands? Are we to understand the attitude as one of prayer or one of adoration? And, if it be prayer that is symbolized, for what do the suppliants pray? The answers to these questions are not unaffected by dogmatic interests. According to the opinion of Wilpert, the *orantes* are praying for the salvation of their friends who still remain upon the earth. In some of the inscriptions we find the survivors asking for the prayers of the departed.[4] On the other hand, we meet with the attitude in some cases where it unquestionably symbolizes adoration, or at least the prayer in which entreaty loses itself in submission. Thus in the OT scenes of deliverance from death the rescued appear often in the attitude of *orantes*. So Noah stands in the Ark, and Daniel among the lions, and so the three children appear in the furnace. Yet in each of these cases the deliverance has already been granted. If anything is asked for, it can only be the continuance of something begun. So the new inmates of paradise seem to stand in an attitude of wondering recognition. In the highest Christian prayer entreaty ceases because the human will is one with the divine. The lifting up of the hands was a Jewish as well as a Christian practice (Is 1^{15}, 1 Ti 2^8).

3. The heavenly feast. — The Christians who buried their dead in the catacombs had two sacraments, both of which are frequently symbolized in the paintings. In baptism the believer was admitted among the number of the elect. He became a 'saint' in the original sense of that word. On the tombs we find representations both of the baptism of Christ by His forerunner and of the Church's baptism. There are also three pictures of a fisherman, seated on the bank and drawing a fish out of the water with his hook. The figure may point to baptism and to the words of Jesus addressed to the disciples: 'Come ye after me, and I will make you fishers of men' (Mt 4^{19} and ||). If this be so, it would supply an additional reason for the adoption of the fish as a Christian symbol.

In the Eucharist the believer partook of the bread which came down from heaven, and of which he who ate would not die (Jn 6^{50}). In it he had the prophecy of the heavenly feast. When Jesus took leave of His disciples, He told them of the new wine which He would drink with them in the Kingdom of God (Lk 22^{18}). The Crucifixion shattered for a brief interval the hope raised by the prophetic words. Despondency gave way to renewed confidence when it became clear that God had not 'allowed His Holy One to see corruption.' So 'day by day, continuing stedfastly with one accord in the temple, and breaking bread at home, they [the disciples] did take their food with gladness and singleness of heart' (Ac 2^{46}). It is no longer possible to mark the steps by which this early 'breaking of bread' passed into the Church's Eucharist. It is enough to recognize that what afterwards became the ecclesiastical rite originally formed part of the corporate feast of the Christian society. If the presence of the heavenly Christ was, as we can well believe, more vividly realized during these feasts than at any other time, the disciples would naturally associate them with the peace or joy which awaited them hereafter. The fellowship of the earthly feast would provide the mould for their anticipations of future happiness. They might recall the Biblical assurances: 'Blessed is he that shall eat bread in the kingdom of God' (Lk 14^{15}), 'Blessed are they which are bidden to the marriage supper of the Lamb' (Rev 19^9), 'To him that overcometh, to him will I give to eat of the tree of life, which is in the Paradise of God' (2^7). It is profitless to dwell upon the inconsistency of picturing spiritual happiness by an image which appeals only to man's bodily appetites. For in the 'new world' which, whether it be peopled by corporeal or incorporeal beings, is in any case to be the scene of fruition every earthly image, the most attenuated equally with the most material, becomes obsolete. An instrument intended for a region surrounded by an atmosphere is useless when the atmosphere is transcended. Thus the most spiritually-minded Christians, restricted by limitations from which they cannot escape, may well continue, as they do, to associate heaven with the 'shout of them that triumph, the song of them that feast.' In the catacomb paintings heavenly happiness is frequently represented by the image of festal joy. The scene of the feast is marked, by the customary indications, as paradise. The guests are to be seen, generally if not always, behind the roll which is the recognized symbol for the cushions used at feasts. Often attendants appear carrying a dish or holding a flagon or wine-cup. In one series of four pictures these attendants take the form of two female figures who are designated by inscriptions as 'Irene' and 'Agape.' They are appealed to by the guests to supply warm water or to mix the wine ('Irene, da calda'; 'Agape, misce nobis'). One of the figures seems thus to symbolize the peace of heaven, and the other the love from which the Christian love-feast derived its name, and which was one of St. Paul's three abiding things.[1] The food indicated in these pictures consists invariably of bread and fish. Sometimes a number of baskets, filled with small round loaves, appear either in front of the cushion-roll or on either side of it. The miraculous feeding of the thousands was plainly the model in the painter's mind. This miracle, connected by St. John (6^{35}) with the 'bread of life,' was an anticipation of the heavenly feast. Similarly prophetic was the Church's Eucharist, which in some of the paintings seems to be expressly depicted and made a symbol of its heavenly antitype. It need only be added that the fish, from its presence in the miracle, as well perhaps as for the reason given above, appears to have established itself as a symbol for a Christian disciple, long before the acrostic was discovered: ἰχθύς = Ἰησοῦς χριστὸς θεοῦ υἱος σωτήρ.

It will appear from the foregoing summary that, while Christian symbolism points persistently onwards towards an ideal world, conceived as lying beyond death, the hope thus expressed is sustained by experiences which are prized for their own sake, and also as earnests of things yet to come. Eternal life, the ultimate blessing of the Fourth Gospel, is there represented as both present and future. So the Messianic kingdom of the earlier evangelists was yet to come, while it was also 'within' or 'among' the disciples who walked with Jesus and saw God in Him. The Church which continued His ministry in the ages that followed was likewise a prophet of what was yet to be, and also a teacher of men amidst the dangers and obligations of actual life. Thus in the Middle Ages, while the three theological virtues (faith, hope, charity) appear repeatedly on church porches, pulpits, and monuments, the cardinal virtues (prudence, justice, fortitude, temperance) also assume their symbolic shapes. The Church is a teacher of common-place morality, while at the same time she must bear witness to truths whose validity cannot be demonstrated by everyday experience. The Christians who built the catacombs tell us in many inscriptions of the central hope with which they consigned their dead to the tomb. Their desire was that the departed might 'see God' ('Vivat in Deo,' 'Vives in æternum,' 'Deum videre cupiens vidit'). Such is the hope, vague and yet real, changing but steadfast, which has created the Christian symbols of the past, and may be trusted to fashion new ones as the human heart becomes more proficient in the interpretation of its own language.

SYMBOLISM (Greek and Roman).—A symbol is a visible or audible sign or emblem of some thought, emotion, or experience, interpreting what can be really grasped only by the mind and imagination by something which enters into the field of observation.

So far as Greek and Roman religion are concerned, we need speak only of two kinds of symbols—symbolic representation by means of actions or words and symbolic representation in art.

Religion, taking its rise in experience and belief, tends, as it becomes less literal and less insistent, to give rise to symbolism; and this is true also of that lower kind of religion which is called magic. When primitive men thought that by certain actions and words they could compel spiritual powers to do their bidding, or when they thought that the painting of animal forms on the walls of their caves gave them power over the animals depicted, they had not yet reached the stage of symbolism, but had taken the first steps towards it; when they poured water on the ground to produce rain, they thought that there was an actual causal connexion between the ritual act and the fall of rain. But just as, when religious belief decays, the feelings which gave rise to it often find scope in the field of poetry, so, when actual belief in the power of sympathetic magic grows less, the actions and ceremonies to which it led are often continued in symbolism.

I. *GREEK.*—1. **In local cults.**—The local cults of Greece, which went on at a lower level, and in a more conservative key, than the religion of poetry and of philosophy, preserved a great deal of symbolism. Even in Athens the great festivals embodied such traces of primitive religion. At the Brauronian festival young girls, impersonating bears, danced a bear-dance in honour of Artemis. At the Diasia the priest who struck down the sacrificial ox was accused of murder and in turn accused his instrument, the axe, which was condemned and solemnly cast into the sea. In the worship of the dead flowers and fruits gradually took the place of the more serious offerings of an earlier time. With the dead were buried, not, as in primitive times, real armour and ornaments, but only symbolical offerings, money of gold-leaf, animals of terra-cotta, and the like. Sometimes these objects were only depicted in relief on the tombstone. The terrible human sacrifices once brought to the sterner deities were commuted into sacrifices of animals, sometimes clad in human fashion, or mere images of human beings. Naturally it was in the mysteries, where the survivals of primitive religion were most rife, that symbolism was most prominent. Mere ceremonial ablutions took the place of actual immersions as a ceremony of purification. The sacred meal which the deity shared with his votaries became a mere ceremonial tasting of some special food. At Eleusis, in the great mysteries, the votaries emptied two vessels filled with water, turning to east and west and repeating the sacred formula ὖε, κύε ('Sky pour rain; earth bear grain'), which was directed to earth and sky, and was evidently a survival of an ancient magical formula for the production of rain.

The suppliant who visited the cave and oracle of Trophonius at Lebadeia, before he went into the presence of the hero, drank from two springs, that of oblivion and that of memory, to signify that he was to forget the past and to remember the revelation which was to come to him. Originally, in all probability, the water of these springs was supposed to have some actual effect on the votary, as had the spring in the cave of the Clarian Apollo at Colophon on the priest who drank of it before soothsaying. But in the time of Pausanias[1] the action had become merely ritual and symbolical.

The sacred marriage was common to several cults in Greece. When the notion of the deity was somewhat crude, women were shut into the temple, to stand in the same sexual relation to him in which, according to tradition, Cassandra stood to Apollo. But, as time went on, such dedication became only symbolical, the place of the victim being sometimes taken by the wife of the priest.

As the mystery religions spread and their outlines hardened, a new element came in, which was destined to take further development in Christianity—the element of authority. Symbolic rites were practised, not on the ground of mere tradition, but by ordination of the recognized hierophants of each cultus, who claimed a divine communication. This element, however, scarcely belonged to the earlier religious view of either Greeks or Romans, among whom authority in religion was scarcely recognized apart from tradition. Cults had an open field and freely competed one with another, except those with which the safety of the State was supposed to be connected.

It seems that almost all ritual which does not appeal to the intelligence is in character symbolic. And the notable feature in symbolic ritual is that, since it appeals mainly to the emotions, it may be interpreted or understood in a great variety of ways. At the mysteries of Eleusis, *e.g.*, some of the votaries might regard the whole proceedings as a sort of spell to cause fertility; some might be genuine worshippers of the great goddesses Demeter and Persephone; some might, like Cicero, find in the ritual a promise and pledge of a life beyond the grave. Everything depended on the religious outlook, the exalted or materialist beliefs of the votary himself.

'Aristotle,' says Synesius,[2] is of opinion 'that the initiated learned nothing precisely; but that they received impressions, were put into a suitable frame of mind.'

Thus symbolic ritual has a great attraction for persons of emotional temperament, while it is distasteful to those of strongly developed intelligence, who like definite views. Compared with clear doctrine, it is like music compared with painting. It was by no means well suited to the minds of the more cultivated Greeks.

2. **In art.**—In early Greek art symbolism appears in two forms: in representing by some simple figure an idea such as a quality or attribute of one of the deities and in representing the whole of anything by depicting some characteristic part of it.

A few symbols of the deities seem to have been taken over by the Greeks from the pre-historic peoples whom they displaced in Crete and Hellas. Such is the double-edged axe, which is found in the palace of Cnossus in Crete in the third millennium B.C. in scenes of cultus, and which belongs to a male or female deity of the people. This axe became among the Greeks a symbol of Dionysus. The snake also appears as an attribute of a goddess of Crete frequently represented, and later was inherited by the Greek Erinyes. But most of the symbols of the gods of the Greek pantheon seem to be more immediately derived from the art of the nations of Syria and Mesopotamia. Most of these symbols were displaced by growing anthropomorphism. This statement requires some explanation. On early bronzes and terra-cottas found on Greek sites, dating from the 7th or 6th cent., the goddess Artemis is figured as winged and holding in her two hands lions, panthers, or swans. On the chest of Cypselus, a

[1] IX. xxxix.
[2] Aristotle, *Frag.*, ed. E. Heitz, Leipzig, 1869, p. 40.

7th cent. work preserved at Olympia, Pausanias[1] saw such a figure, which surprised him by its strangeness. It was strictly symbolical; the wings were not for flight, but only to typify swiftness, the lions were added to show the power of the goddess over animals, whose mistress (*πότνια*) she was. We can trace this representation step by step through Greek art and see how in maturer times the swiftness of the deity was indicated by her stature and slimness of build, her power over animals by the stag or dog who accompanied her. A similar transformation takes place in the case of Zeus. On early coins of Elis an eagle appears as a substitute for the god; later he bears the eagle in his hand. Later still, as in the great statue of Pheidias, a golden eagle was an adornment of the sceptre of Zeus. Thus, as time went on, merely outward symbols tended to disappear or at all events to become unimportant; and the meaning which they had conveyed was expressed in the type of the deity. Certain symbols, however, held their ground. The thunderbolt of Zeus, indicating him as the lord of storms (*Ζεὺς ὑέτιος*), is usual in the 5th century. To express this feature in the type of the deity would not be easy. The bow, as symbol of the rays of the sun-god,[2] is usual in the hand of Apollo in archaic representations; later the lyre is far more usual. Even wings do not altogether disappear, but they mostly lose their merely symbolic character and are used for flight, as in the case of Victory and Eros, an innovation ascribed to the sculptor Archermus of Chios (*c.* 570 B.C.). The god Hermes, even in late art, carries wings on his cap or his heels—a survival of archaic symbolism.

Coins furnish us with many examples of symbols belonging to the deities. In the 7th and 6th centuries the obverse of electrum and silver coins usually presents some very simple symbolical device—a griffin at Teos and Abdera, a thunderbolt at Olympia, a wolf at Argos, an owl at Athens; and then, after the archaic period, this type is usually banished to the reverse of the coin, and in its place we have the head of the deity to whom the type belongs. It must, however, be observed that, when numismatists speak of a symbol on a coin, they use the word in a technical sense, to indicate not a symbolical type, but one of those small and subsidiary devices often placed in the field of a coin by magistrates who were responsible for its issue—a device probably often taken from the private signet of such magistrates.

Another phase of symbolism is found when in artistic representation a part is taken to stand for the whole. This often appears on Greek vases and reliefs. Pausanias[3] observes that, in the painting representing Hades by Polygnotus at Delphi, the grove of Persephone is represented by one tree. So on vases a temple or a house is often represented by a single column, a river by a swimming fish, a sea-shore by a shell, and so forth. It is probable that this was how the scenes in tragedies were represented on the background of the stage. It is really a sort of shorthand, and altogether parallel to the process by which in Egypt and elsewhere picture-writing came into being.

Symbolical or allegorical impersonations are to be found in Greek art at all periods, though more often in archaic art and that of Hellenistic times than in the greatest period. On the chest of Cypselus, in the 7th cent., we are told by Pausanias[4] that Night was figured, carrying two boys, one white and one black, who represented Sleep and Death respectively. Justice as a beautiful figure scourged Injustice, who had the form of an ugly woman. Fate, with teeth and claws like a wild beast, claimed Polynices as a victim. Even in the great age we have such figures as Virtue, Nemesis, Opportunity (*Καιρός*). But it is in the Hellenistic age, in the great cities of the East, that symbolic personalities most abound. In the celebrated procession of Ptolemy II. of Egypt[1] we have figures of the Year and the Seasons; in that of Antiochus IV. of Syria[2] we find statues of Night, Day, Earth, Heaven, Morning, and Noon. On the coins of Alexandria under the Romans we find a remarkable set of fanciful figures—Euthenia (Prosperity), Kratesis (Dominion), and the like.

The great Ionian cities of Asia Minor appear on monuments of the Roman age in the persons of the legendary Amazons whom they claimed as their foundresses.[3] Smyrna on coins carries a double-axe and has a prow of a ship at her feet; Cyme holds a dolphin and a trident; Teos, a city renowned for vines, carries the thyrsus of Dionysus; Ephesus carries poppies and ears of corn, and so forth. In each case the attributes embody the situation or the produce of the city. In a noted Pompeian painting[4] we have well-characterized impersonations of Europe, Asia, and Africa. The list might be almost indefinitely lengthened.

Symbolism in Greece, in the great period, often takes fine poetic forms, as when the sun-god in his chariot on the pediment of the Parthenon represents the East in the morning, or boys plunging into the sea represent the setting stars on a fine vase in the British Museum.[5] In the same age rivers are represented by man-headed bulls, as on the coins of Gela and Catana in Sicily; nymphs have cows' horns; Alexander the Great appears on the money of his general Lysimachus with the ram's horn of Ammon.

But, in spite of such examples as these, there is a broad line of distinction between the use of symbolism in Oriental art—the art of Babylon, Assyria, Egypt, and India—and the use in Greek art. Oriental art is content with adding symbols to the human forms of deities, without caring for their beauty or appropriateness. In Egypt and Babylon we find human bodies joined to the heads of all kinds of animals—lion, bull, jackal, hawk, and so on. And Indian figures of deities represent them with several heads, many arms (each holding some attribute), necklaces of skulls, and the like. Oriental art tries to represent in this way qualities and attributes which sculpture or painting could not otherwise portray—elements of mysticism, mythological tales, or sometimes the ideas of pantheistic religion. Greek art avoids monstrous forms as a rule, though it inherits a few specially suitable for artistic development, such as the Centaur. And it does not attempt to portray, in sculpture or in painting, anything which lies outside the scope of those arts. Exquisite in form and clear in meaning, its creations do not carry us beyond sense and intellect, do not appeal to the mystical tendencies of men. Thus Greek symbolism has no wide limits.

II. *ROMAN.*—**1. In cult and law.**—In Roman religious ceremonies the symbol held a large place. This was natural, as in quite the early times of the republic there was an invasion of Greek religion and Greek deities, which caused the old rustic religion of the Roman people to survive only in the form of ritual, the meaning of which was in a great degree obscured. Hence the State cultus of Rome was divorced alike from belief and from morality, and, so long as the magistrates performed

exactly the ceremonies handed down by their ancestors, it mattered little what meaning they attached to those ceremonies or what beliefs they held in religion. The emperor, whether he were a Trajan or a Nero, was always *pontifex maximus* and represented to the gods the State in its religious capacity. Hence the Romans were extremely careful as to the way in which they wore the toga or the cap called *apex*, as to their exact position in relation to the points of the compass, and as to the attitude in which they stood when they were sacrificing. All these details had no doubt some meaning in their origin; but not only are we unable usually to discover what it was, but even the Romans did not know: they blindly followed the tradition, with an uneasy feeling that, unless they did so, some great calamity would overtake the State. Most of these ritual customs were probably derived from the Etruscans, a people at a low level of culture, but exact in all matters of a religion which seems scarcely to have risen above the level of magic.

When an official conducted a sacrifice, he sprinkled the victim with wine and threw over it salt meal; then he made a ritual motion symbolical of slaying it, but the actual butchering was done by attendants.[1] Like the Greeks, the Romans contrived to put in the place of human sacrifices the mere offering of substitutes and symbols.[2]

When the Greek deities migrated to Rome, they took with them their recognized symbols; and the native gods, who were largely identified with the immigrants, also adopted these outward signs of inward powers. Thus in art Greek customs went on, as in fact the artists were usually Greek. So we have on Roman monuments the symbolism of Ephesus and Alexandria. Allegorical and symbolical figures, such as Pudicitia, Ubertas, Annona, appear abundantly on the Roman coins; but they can have had but little serious worship. In short, while symbolism is of importance in relation to Roman cultus, it is unimportant in earlier Roman art, requiring a concrete poetical imagination of which the Romans were destitute.

There was a good deal of symbolism or symbolic ritual in the customs of Roman law; *e.g.*, if a man purchased a slave, he laid hands on him (*mancipatio*) in the presence of witnesses and weighed out at the same time to the seller a piece of money which was accepted as a symbol of the price, *quasi pretii loco*, as Gaius says.[3] We need not be surprised that much symbolism made its way into Christianity in Rome, since it had become a recognized part of the routine of daily life.

2. In art.—In the time of the Roman dominion, as the religion of Mithras and other mystery cults spread from east to west through Europe, the range and power of symbolism increased. We may especially trace on tombstones of the period of the empire, alike in Italy, Gaul, and other regions, a growth of religious symbols mainly having reference to the life beyond the tomb, which was taking an ever larger place in men's thoughts and hopes. Some of the mythological scenes which the Greeks had depicted on tombs, from mere artistic and decorative motives, seem to have been re-interpreted in a more mystic fashion. Such were the rapes of women and the combats of men; and more especially scenes from the lives of Heracles and Orpheus and other heroic persons who had won immortality by great deeds, or had descended into Hades and returned. Some ordinary figures of earlier art—the griffin, the lion, the bull, the cock—became connected with the hope of immortality. The Mithraic shrines of northern Europe contain reliefs in which symbolism seems to run wild, though we know so little about Mithraism that our interpretation of such reliefs is usually conjectural. On this subject the works of Franz Cumont are authoritative. It is impossible here to discuss the question of the symbolism on later pagan tombs. A good account of it will be found in Mrs. Arthur Strong's *Apotheosis and After Life* (1915). This writer, however, goes too far in interpreting almost all the scenes and figures on such tombs in reference to the future life. It is obvious that, unless we keep in restraint the tendency to read mystic meanings into painted and sculptured scenes, we may drift back into the fancy world of Creuzer, who traced the influence of the mysteries everywhere on Greek vases and Roman reliefs. We are on safer ground in speaking of contemporary Christian art, because here we have a literature for comparison.

In the early Christian art[1] of the catacombs and of sarcophagi there is even an increase of symbolism, as compared with contemporary pagan works. This is natural, because the Christians commonly adopted pagan types, only giving them a fresh meaning; *e.g.*, the peacock, which in Greek art belonged to Hera, became to Christians a symbol of the resurrection, probably because the flesh of the peacock was supposed not to decay. Orpheus became an emblem or symbol of Christ. The fish, the sheep, the vine, all acquired a new Christian signification. Probably in many cases the meaning would not be realized by the pagan artist who was called in; and it was safer that the knowledge should be confined to the society. This symbolism is apt to degenerate into something like shorthand: a man carrying a couch refers to the miracle of the healing of the paralytic man; a cock beside Peter to his denial of his Master, and so forth.

The use of symbols in the later Neo-Platonic philosophy is so closely connected with their use in Christianity that it need not be here treated. See art. NEO-PLATONISM.

LITERATURE.—There is no recent work which deals methodically with Greek symbolism. Roman symbolism is treated in Mrs. Arthur Strong, *Apotheosis and After Life*, London, 1915.

P. GARDNER.

SYMBOLISM (Hindu).—Of all religions of the East, the home of type and imagery, Hinduism makes the most use of symbols. It has formally declared the ultimate truth to be unknowable and indefinable. In all its scheme of practice and teaching it seeks to make definite approach to the reality by suggestive type or symbol—an approach that can never find its goal, but can only draw nearer and nearer, as it points successively, like the ancient Greek philosophers, to the symbol or likeness which most fully and faithfully reflects the true, and embodies the largest part of a reality which in its entirety is inconceivable by the human mind and inexpressible in the language of men. The symbol is the necessary and helpful intermediary between the inadequate capacity of the mind of the would-be worshipper and the incommunicable nature and fullness of the Unknown whom he adores. A complete and adequate description therefore of the Hindu use of type and symbol would require an almost complete exposition of Hindu belief in its many varieties and ramifications. Whether in creed or in practice, the symbolic in Hinduism is not far from being co-extensive with the religion itself. Of this the literature of Hinduism and its systems of doctrine are sufficient illustration. All, however, that is practicable within the limits of an article is to indicate the motive or motives that more or less consciously and avowedly have prompted the use of the symbol, to set forth in the briefest possible

manner its historical relations in the religious scheme and cult, to define its necessary limits, and to select for illustration and comment a few of the more important types which have occupied a considerable place in the belief and profession of the adherents of the faith. A mere enumeration of the symbols employed would be a large and probably impossible task.

1. Use and purpose of symbols.—The use and purpose of the symbol is twofold: (1) to set forth in visible or audible likeness what cannot be really or fully expressed to the physical eye or ear, or even clearly conceived by the limited faculties of the human mind. All language is in the last resort symbolic, and religious language in an especial degree, for it endeavours to present a mystery, a reality too deep for words. The Hindu faith had at its service a language of the utmost delicacy and flexibility, with a vigorous and fertile growth and an almost unlimited vocabulary, and found itself in a world of tropical luxuriance, with a tropical wealth of beauty and suggestiveness. It was not to be wondered at that it became profuse in type and symbol and laid under contribution all the facts and phenomena of nature to serve its religious and priestly ends. All the great gods had their resemblances, animal or material forms, in which they presented themselves embodied to human sight, which served to recall to the worshipper the deity, whose mind and character they more or less inadequately reflected. Other more rare and refined symbols were presentative of qualities or attributes, as the lotus, the emblem of spotless purity preserved under the most unfriendly conditions. All idols, totems, fetishes are symbols. The wise man does not worship the symbol, the shape in clay or wood or stone, but is thereby reminded of the invisible substance or reality which they each represent.

(2) The image or symbol serves the purpose also of providing in material and suitable form a convenient object of reverence, to meet the religious need of those whose minds, through darkness and ignorance, are unable to grasp the conception of an unseen formless deity. Such men, if left without a visible object to which their reverence and fear may attach themselves, will wander in a maze of doubt, disquiet, and unbelief. It is better that they should worship erroneously, worship a thing, than that they should not worship at all. There is much that might be urged in favour of the Hindu view that regards the worship of the external symbol as a stepping-stone to higher, clearer forms of belief; it is a view unacknowledged perhaps but not unknown to other faiths. And in Hinduism, whatever may be said of or claimed by the wise and instructed thinker, the *pūjā* of the multitude to the image of the god is reverent and sincere. In some respects also and within definite limits the Indian contention has justified itself that the symbol has proved a signpost and a guide to better, higher thoughts and to a truer worship of Him whom no form can express or language describe.

2. The most important types.—(*a*) The most important symbols are those of the *Brahman*, the undefinable and unknowable origin and source of all. Of the *Brahman* only signs and types can be employed, for the primeval source and sustainer of the universe is beyond and above thought or word. His names or titles are symbolic: *hiranyagarbha*, the golden germ, that was in the beginning; *svayambhū*, the self-existent one; *viśvakarman*, the artificer of all things; and many others. The authors of the *Upaniṣads* especially attempt to set forth in symbolic terms the being and nature of that which in the last resort they are obliged to confess is beyond knowledge. *Prāṇa*, the breath, or *vāyu*, the wind, is a frequently recurring type; and it seems to have been felt that by its mysterious and elusive character the *prāṇa* was peculiarly fitted to represent that which in its essence eludes comprehension. The breath, *prāṇa*, is *Brahman*.[1] A similar type is the *ākāśa*, the all-pervading and all-surrounding ether, 'omnipresent and unchanging in the heart.'[2] *Manas* also, the mind or will, is with the *ākāśa* a symbolic form or type under which the *Brahman* is to be meditated on or worshipped.[3] The mystical syllable *Om*, the most widely venerated syllable in the world, is the highest *Brahman*, and its utterance with understanding of its significance secures the accomplishment of every wish.[4] *Om* is also a symbol of the Hindu triad, Brahmā, Viṣṇu, and Śiva, and each of the three sounds of which the word is composed represents one of these deities. To the Buddhists also the word is a symbol of much significance, forming part of the sacred six-syllabled formula which every Buddhist cherishes in his memory and makes a constant part of his invocation and prayer.

A more comprehensive and suggestive symbol of the *Brahman* is given in the compound *sachchidānanda*, a kind of triple representation in three several modes or aspects, as *sat*, 'being,' *chit*, 'thought,' and *ānanda*, 'bliss.'[5] This more refined and abstract symbolizing represents a later phase of speculative thought and marks a forward step in the progress of philosophic insight. As a type or symbol it is less inadequate than the sun in the heavens (*āditya*),[6] the material *ākāśa*, the golden *puruṣa* in the eye,[7] or even than *manas*, or the significant name *ātman* itself. In its further course, moreover, speculative thought denied that even in *sachchidānanda* any positive implication concerning the *Brahman* did or could reside. The *Brahman* transcended all symbols and assertions, comprehended both being and not-being (*sat*, *asat*), thought and not-thought (*chit*, *achit*), bliss and its contrary (*ānanda*, *anānanda*), or rather he was above and beyond all, the unsearchable and unknown.

(*b*) Each of the great gods has an animal or material form or object which represents him to the eyes of men, by which he is symbolically known. The more popular gods have many symbols. The 'vehicles' of the gods are practically symbols of their presence and power—the goose of Brahmā; Garuḍa, the monstrous eagle of Viṣṇu; the bull (Nandi) of Śiva; the fabulous sea-monster (*makara*) of Varuṇa, who is then depicted as a white man and is described as *makarāśva*, 'he whose steed is the *makara*,' riding, with the head and fore-legs of an antelope and the body and tail of a fish; the peacock of Kārttikeya, the god of war; the monkey of Hanumān; the deer of Vāyu; the elephant Airavata of Indra, produced with other sacred and marvellous objects at the churning of the ocean; the buffalo and dogs of Yama; and many others. Of the well-known Hindu triad Brahmā hardly possesses any emblem or type except his sacred goose—an indication of how little the first member of the triad attracted to himself the thought and worship of the Hindu. Of the popular Viṣṇu there were many symbols, some of which are always represented on the images or pictures of the god. The most frequent and characteristic is perhaps the *chakra*, or discus;

[7] *Taitt.* ii. viii. 5; *Chhānd.* i. vi. 8.

the club and conch-shell also which he carries are indicative of his authority and power. The auspicious mark (*śrīvatsa*) usually represented on the breast of the god, in form like a curl of hair, and the three-pronged or trident-like mark made with white or coloured earths on the foreheads of his worshippers are symbolic, the latter of devotion to the service of the deity. The sacred *tulasī* plant in the courtyard of the dwelling is the mark of the deity's presence and protection, and in it centres the worship especially of the women of the household. The *śālagrāma* also, the sacred ammonite-stone, is another mystical and well-known symbol.

The symbolic types or presentations of the rival deity, Śiva, who in almost equal degree with Viṣṇu holds the affection and regard of the Indian peoples, were equally numerous. The most important are the bull Nandi, on which he rides, and the *liṅga*, or phallus. Every Śaivite temple has its sacred bull, who roams the courtyards and streets unmolested and receives practically divine honours. The *liṅga* is the commonest emblem of the god, and the stones, great or small, which represent him have this form or are roughly shaped to it. Two of these stones are said to bear a pre-eminently holy character: that at Benares, where Śiva is worshipped as Viśveśvara, *παντοκράτωρ*, the lord of all; and the idol in the temple at Somnath, destroyed by Mahmud of Ghazni in his iconoclastic raid into India. The trident also is borne by Śiva, a type of government and authority; and the crescent moon depicted on his forehead has a special significance, recalling the sovereignty which was assigned to him when the moon was recovered from the depths of the ocean.

Similarly the wives of the great gods have each their symbols—the trident and skull of Kālī, the lotus of Sarasvatī, wife of Brahmā, and also of Lakṣmī, wife of Viṣṇu.

In a late writing the Gāyatrī is said to represent the triad of gods, Brahmā, Viṣṇu, and Śiva, and also the three Vedas.

(*c*) Under sacred trees in the vicinity of Indian villages will often be found the images or symbols of the *grāmadevatā*, the village divinities who watch over its interests and care for the inhabitants; and in the village fields the clay or pottery steeds of Aiyanar (*q.v.*), the tutelary deity of the fields, on which he rides by night to pursue and rout the demoniac powers.

(*d*) There are symbols also of a more general import, which are not always easy to classify. The *piṇḍa*, or ball of cooked rice, used at the commemorative services for deceased relatives and offered to the *pitṛs*, represents symbolically the share which the departed still have in the family life. The most important and widely recognized symbol of this character is probably the sacred footprint, which typifies both the presence and the authority of the god. In the courtyard or vicinity of many, perhaps most, Hindu temples there is the print of a foot on the ground, often of large size, with sacred symbols engraved on the sole, which differ according to the deity commemorated. To these there is sometimes a legend attached, which gives its supposed history and describes the occasion on which it was impressed. The well-known footprint on Adam's Peak in Ceylon is believed by Śaivites to be that of Śiva. By Buddhists also the numerous footprints of the Buddha are regarded with reverence.

(*e*) In many parts of India the symbols of the sun and moon and the planets may be seen. The two first are represented by a disk or crescent respectively, made of metal. The signs of the planets in their order are as follows: of Budha, or Mercury, a bow; of Śukra, or Venus, a square; of Maṅgala, or Mars, a triangle; of Vṛhaspati, or Jupiter, a lotus; of Śani, or Saturn, an iron scimitar or sword; of Rāhu, a *makara*; and of Ketu, a snake. The last two symbols are usually of iron; the square of Śukra is silver or silvered, and the bow of Budha is gilt.

(*f*) Hindu coins and seals also bore symbols, which were very numerous and diversified. Besides figures of gods and goddesses, the commonest emblems were the trident, denoting empire; the elephant or bull, power; the umbrella, royal dignity and right; the crescent, a lunar dynasty; a thunderbolt, spear, or other weapon, armed might. Others also with these were indicative of the authority or claims of the sovereign by whom they were designed.

A. S. GEDEN.

SYMBOLISM (Jewish).—Symbolic actions as well as symbolic ideas occur in the Hebrew Bible frequently. The prophets often made use of symbolic ideas—*e.g.*, the basket of fruit in Am 8^{1}, the vineyard in Is 5^{1-7}, the almond-trees in Jer 1^{11}, the dry bones in Ezk 37^{1-14}, and the various figures in Zechariah. Equally frequent are symbolic actions—*e.g.*, the rending of mantles (1 S 15^{27}, 1 K 11^{30}), the discharge of arrows from a bow (2 K 13^{15-19}), the casting of shoes (Ps 60^{8}, Jos 5^{15}, Ru 4^{7}). The former type easily merges into the parable, the latter into charms; possibly we should say that they emerge from these literary and magical arts. Symbols, in any case, have frequent historical connexion with primitive culture, though they tend to transcend their origin under the transforming influence of higher conceptions. Most important, therefore, for the present article is the association of symbolic ideas with religious ceremonial. Prominently the Sabbath is described as a symbol, *ôth*;[1] similarly with the rite of circumcision (Gn 17^{11}), the phylacteries (Dt 6^{8}), the Passover (Ex 13^{9}), natural phenomena such as the rainbow (Gn 9^{12}; cf. Gn 1^{14} in the Rabbinical commentaries).

It was accordingly easy for later Judaism to apply symbolic meanings to many of the Biblical institutions. Philo, throughout his works, elaborates such interpretations, but the method is much older. Thus in the *Letter of Aristeas* (which can scarcely be later than the 2nd cent. B.C. and may well belong to a century earlier) the enactments as to the animals lawful for food are explained symbolically.[2] But by Philo's age symbolical interpretation had so fully developed that the Alexandrian allegorist felt impelled to rebuke those of his brethren who neglected the ceremonial acts because they regarded them merely as symbols of ideal things.[3] Though this is a real danger to a ceremonial religion, on the other side it can gain appreciably by idealizing institutions the original significance of which is outworn or unknown. Ancient rites may have been derived from primitive tabus, and yet they have retained permanent acceptance by the process of symbolization. In a remarkable letter Maimonides (*q.v.*) dealt with certain acts of worship, such as prostration (as practised by Muhammadans in the 12th century). Probably such acts were derived from olden customs of exposing parts of the body, but, contends Maimonides,[4] they no longer mean anything

[1] See art. SABBATH (Jewish). [2] §§ 139–166.
[3] *De Migr. Abrahami*, 16 (*Opera*, ed. T. Mangey, London, 1742, i. 450).
[4] *Teshûbôth She'elôth we-Iggarôth* ('Letters'), Constantinople, 1520, fol. 5*b*.

of the kind and have become symbols of humility. Present values do not entirely depend on past origins. A similar principle might undoubtedly be very widely applied to the history of religious ceremonial, which often becomes ennobled by the newer ideas read into it by progressive ages. And, conversely, when an institution is lost (as with the Biblical sacrifices), the whole system may be retrospectively idealized by symbolical adaptation. When, after the destruction of the Temple, prayer and charity and fasting perforce displaced sacrifice, the latter shared in the moralizing process. But the relation went deeper. Fasting *was* sacrifice: the loss of bodily tissue corresponded (in the Rabbinic conception) to the offering of a sacrificial animal on the altar.[1] The table at which the ordinary meals were eaten became a veritable altar,[2] and the partaking of food was in the Jewish home associated with a variety of customs, derived in large part from the same range of symbolism. It has often been claimed, moreover, that the dietary laws, besides being included in the law of holiness, or rather because of that inclusion, were a training in control of the appetites and restraint of desires.[3] Maimonides also offers a utilitarian view, that the forbidden food was unwholesome;[4] thus showing that, though the utilitarian and the symbolical interpretations are in a sense rival theories, they may be syncretized by a skilful moralist.[5]

Another aspect of the same phenomenon is presented by symbolic survivals. Acts which were once literal are retained as rites. Many current Jewish marriage customs are of this nature. The bridal canopy, so picturesque a feature of a Jewish wedding, was originally the marriage chamber. Then the Scriptural application of the marital state to the relation of God to Israel led to symbolic results, among them the appointment of a bridegroom of the Law on the feast of Rejoicing at the end of Tabernacles.[6] It is not quite clear why a glass is broken at Jewish weddings; it is probably a *memento mori*.[7] Funeral customs are also marked by symbolic survivals. Some of these are Kabbalistic in origin, and it is not always easy to discriminate the symbolical from the superstitious.[8] So, too, with such ceremonies as *tashlikh*.[9] Many symbolical customs arose in memory of the destruction of the Temple. Historical associations are also responsible for many a symbolic rite. Draping the synagogues in black on the fast of the 9th of Ab is an instance in point. The *shofar*, or ram's horn, was thus connected with events and anticipations, with Sinai in the past and the Messianic age in the future. According to Se'adiah, the *shofar* symbolized ten ideas: (1) creation, (2) repentance, (3) revelation, (4) prophecy, (5) destruction of the Temple, (6) the binding of Isaac, (7) imminence of danger, (8) day of judgment, (9) restoration of Israel, and (10) resurrection. In this manner many rites were saved from becoming obsolete. The phylacteries worn on the head typify service of the mind; on the hand, service of the body. The former represents the recognition of the Godhead, the latter restraint of lust.[1]

Jewish symbolism is also illustrated in ecclesiastical art, and in colours. Thus the blue thread on the fringes (Nu 15^{38}) is the colour of the sea, the sky, the divine throne of glory.[2] The symbolism of art was more thoroughgoing. The Crown of the Law is a frequent ornament on mantles of the scrolls, and so is the Shield of David.[3] On ancient Jewish coins, too, symbols were employed; so also with tombs.

The prevalent custom now is to avoid sepulchral emblems. This accords with the oldest rule, for the *ṣiyyun* of the Talmud was only a mark warning wayfarers against incurring ritual impurity by contact with the tomb. Yet the action of Simon, who carved panoplies and (possibly) ships on the pyramidal tombs at Modin (1 Mac 13^{29}), can scarcely have been isolated. Outside Palestine the Jews of the first centuries of the Christian era certainly adopted the Greek habit of inscriptions and introduced symbols, such as an oil vessel, the seven-branched candlestick (symbolical of the soul [Pr 20^{27}]), the ram's horn (Messianic), and an ear of corn (type of the resurrection). These emblems are parallel to those on the Maccabæan coins and to those favoured by Jews in the late mediæval period. At that late date symbols appear descriptive of the dead, as out-stretched palms as in act of benediction (for priest), ewer as in act of bathing (Levite), a harp for a musician, a crown for a goldsmith, and so forth. In the 18th cent. Jews, like their Christian neighbours, used symbolical signs for houses and businesses. Thus the Rothschild family still exemplifies the custom in its name ('Red Shield'). Ornamental coats-of-arms are found on tombs in the oldest Jewish burial-ground of the Sephardic Jews in London. Such customs are no longer in vogue. There has been a growth, however, of symbolism in synagogue decoration in the form of glass windows mostly without human or animal figures.

In the Talmud a good deal of legal symbolism was taken over from ancient Biblical as well as from Roman law.[4] Some of this is still retained.

Returning to the more religious aspect of the subject, we may say in general that in the Midrash symbolism is the soul of Jewish ceremonial. Many particulars of the sacrificial system, the ritual of the Temple, synagogue, and home, are treated in this manner. Take, *e.g.*, the rites of Tabernacles—the bearing of palm-branch, citron, myrtle, and willows of the brook (Lv 23^{40}). The palm is the spine, the citron the heart, the myrtle the eye, the willow the mouth, so that, in the synagogue liturgy, the citron atones for heart sins, the palm for stiff-necked pride, the willow for foul speech, the myrtle for lusts of the eye. In another version the old homilists[5] explain the 'four kinds' as symbolizing four types of character. The citron has both scent and taste, so there are men who study and perform; the palm-date has taste but no scent, so there are men who study but do not perform; the myrtle has scent but no taste, so there are men who perform but not on the basis of study; the willow has neither scent nor taste, so there are men who neither study the law nor perform good deeds. The Holy One did not destroy these, but bade all be united into one bundle, the better elements atoning for the less

I. ABRAHAMS.

SYMBOLISM (Muslim). — The Islāmic languages appear to have no exact equivalent for 'symbol.' When it signifies a badge indicative of office, party, or community, the nearest would be *shi'ār*, or in certain cases *ghiyār*; where what is meant by it is a veiled expression for an idea, the Arabic rendering would be *kināyah*.

Islām as a religious system has nothing corresponding to the Christian cross. Muhammad seems to have adopted the Roman eagle as the standard for his armies,[1] but the flag of the later ('Abbasid) khalīfahs was 'like any other, only black in colour with the legend in white, "Muhammad is the Apostle of God."'[2] Those borne by various factions and regiments differed in colour and at times in the wording of the legend; thus the Abbasid colour was black, the 'Alawid green, the Umayyad white; the flag of the Zanji pretender of the year 255 A.H. was a strip of silk with a Qur'ānic legend in red and green;[3] in the processions of the sultans of Tunis white, red, yellow, and green flags were carried; those of the different tribes differed in legend;[4] the flags of the different divisions of the Ottoman army were red, yellow, green, white, red and white, green and white.[5] The Muhammadan colour in India is green,[6] which by an ordinance of the Mamluk Sultan Sha'ban of 773 A.H. on the turban indicates descent from the Prophet.[7]

There is no more common error than the supposition that the crescent (or rather crescent and star) is an Islāmic symbol, and even approved writers on Oriental subjects are apt to fall into it.[8] It was certainly in pre-Turkish times sometimes used as an ornament on the minarets of mosques;[9] and on flags—*e.g.*, that of the Fāṭimids of Egypt, accompanied by a lion of red and yellow satin,[10] and that of the Almohads (A.D. 1159)[11]—and on the sedan-chair of a Zanjid princess.[12] As such the crescent had been employed on the Roman senatorial shoe—a practice for which Plutarch[13] offers a variety of reasons. The current view of its adoption by the Turks is well presented by F. T. Elworthy:

'Hera, under her old moon-name, Iō, had a celebrated temple on the site of Byzantium, said to have been founded by her daughter Keroëssa, "the horned." The crescent, which was in all antiquity and throughout the Middle Ages the symbol of Byzantium, and which is now the symbol of the Turkish Empire, is a direct inheritance from Byzantium's mythical foundress Keroëssa, the daughter of the moon goddess Iō-Hera.'[1]

Keroëssa, supposed to have been not the foundress, but the mother of the founder, of Byzantium, seems to have been an inference from the Golden Horn and so to have no place in this inquiry. Further, it seems correct to say that the crescent and star figure, though rarely, on coins of Byzantium, but as one of numerous ornaments,[2] and that no ancient author mentions any connexion between this emblem and the city. The *signa Constantinopoleos*, according to A. Geofræus,[3] who asserts that the Turks 'neque insigniis utuntur neque coronis,' were quite different. The earliest mention of it in English literature is said to be in the *Arte of English Poesie* by G. Puttenham (1589),[4] who ascribes its introduction to the sultan Selim I. (1512–20), with the notion of increase and brightness, though it has been observed[5] that the crescent is not that of the new but that of the waning moon, while rising in its wake is the morning star of hope; from Puttenham's time the antithesis between it and the cross has been common in English and French literature. F. Sansovino,[6] however, supposes it to have been the ancient emblem of Bosnia, adopted by Muhammad II. when that country was conquered in 1463. This is declared to be an error by Zinkeisen,[7] who speaks of a golden crescent inherited from the Seljuks, and displayed on all the flags and standards of viziers, beglerbegs, etc., appearing on the earliest flags of the Janissaries. With von Hammer Purgstall[8] it is a silver crescent which, with the two-pointed sword of 'Umar, gleamed on the blood-red flag of the earliest Janissaries; in the authority to which he refers[9] the Janissaries' flag displays the sword without the crescent; what appears on the flag of the cavalry is evidently a horseshoe rather than a crescent, with no star. It is worth noticing that the Seljuk chronicler Ibn Bibi[10] compares the shoe of the sultan 'Ala-addin's horse to a crescent and its nails to stars; whence the symbol may originally belong to cavalry regiments. Its occurrence, however, on certain Byzantine coins is remarkable, and seems to have some connexion with its later employment by the Turks, who have not often introduced it on coins.

The symbols of royalty in use at the Islāmic courts were similar to those found elsewhere. In Umayyad times the khalīfah on accession received a rod, a signet, and a scroll.[11] The rod was doubtless the Prophet's; in 'Abbasid times a new khalīfah received not only the Prophet's signet, which was a silver ring with a bezel of Chinese iron with the legend 'Muhammad is the Prophet of God,' but that of his predecessor, with a ruby inscribed with the khalīfah's name.[12] The 'Abbasid khalīfah also wore a crown,[13] against Arab usage;[14] and indeed the etiquette of their court was closely modelled on that of the Sasanians, as appears from the recently published handbook of it by Jāḥiẓ of Basrah.[15] A crown was worn by the Fāṭimids of

Egypt also.[1] In their processions there were borne a rod, a special sword (said to have been made of meteorite), an inkpot, a lance, a target (said to have belonged to the Prophet's uncle Ḥamzah), a horse-shoe-shaped ruby,[2] and a canopy or umbrella. The last of these was a common emblem of royalty, and figures, *e.g.*, at Indian courts,[3] where the sovereign in the 16th cent. was attired 'in a white *qaba*, made like a shirt tied with strings on the one side, and a little cloth on his head coloured oftentimes with red or yellow.'[4] The *qaba* appears in the attire of the Buwaihid Mu'izz al-Daulah (10th cent.),[5] and, with a black robe, a belt, and a sword, it formed the distinguishing dress of a vizier.[6] Apparently the belt symbolized some sort of subordination, as an Indian prince to whom Yamin al-Daulah gave a robe of honour had to be compelled to put on this portion of it.[7]

Homage to a newly-appointed sovereign was (at any rate in early times) indicated by a shake of the hand, the meaning of which is shown by the term employed to be agreement over a bargain. In later times homage was indicated by kissing the ground before the ruler; this practice, originally alien to Islāmic ideas, had become familiar before the end of the 4th Islāmic century.[8] To a newly-appointed vizier (or emir) food was sent in the 4th cent. from the khalīfah's table,[9] probably signifying that he had become a member of the royal household. The practice of offering such a person fragrant herbs[10] is said to have been a purely Persian or Dailemite rite, the sense of which is not clear.

Owing to Islāmic objection to the limner's art, symbolism is very scanty in its architecture, and where found appears to be borrowed. The great mosque of Cordova exhibited in the carvings of its lattices the peculiar form of the Indian cross, the meaning of which is unknown, whereas 'the cresting of the walls, originally painted scarlet, is typical of flame, and, brought from Persia, symbolized the faith of the Ghebers, worshippers of fire.'[11] Probably in such cases the Muslim worshippers and spectators were quite ignorant of the signification. The same is likely to be true of the ornaments to be found on other works of art, such as pottery and textiles. Certain creatures are indeed habitually associated with particular ideas, chiefly on etymological grounds—*e.g.*, the raven with parting—but there is little scope for their employment in art. The symbolism of magical or quasi-magical rites in use in some communities (*e.g.*, the figures representing either a double hand or the spathe of the male palm, indicative of fertility, painted in Tunis on the walls of the house where there is to be a wedding)[12] is probably not Islāmic.

The practices of Islāmic ritual are tralatitious, though taken from many different communities; their symbolic interpretation is therefore conjectural, and is the subject of considerable speculation. Several pages are devoted by the mystic Ibn 'Arabī to the meaning of the postures of prayer (*ṣalāt*):

'The raising of the hands implies that whatever was therein has fallen away; it is as though the Almighty, when He commanded this, said, "When thou standest before Me, stand as a poor mendicant, who owns nothing; fling away everything that thou possessest, and stand empty-handed, setting it behind thee; for I am in front of thee." Moreover since the hands are the seat of power, by raising his hands he confesses that the power is God's, not his own; he who raises them to the chest is thinking that God is in front of him; he who raises them to his ears is thinking that God is above him. Sitting in prayer is the attitude of the slave before his master, an attitude which he may not adopt without the master's leave,' etc.[1]

Similar speculations on the meaning of the ceremonies of the pilgrimage are to be found in the work of Ghazālī;[2] the special garments worn by the pilgrim, *e.g.*, are to remind him of the grave-clothes wherein he will meet his Maker.

Besides explaining much of the Qur'ān as elaborate symbolism the Ṣūfīs (*q.v.*) developed a system of their own, or rather a number of systems; and there are numerous collections of odes in Arabic and Persian which, ostensibly dealing with love and wine, are traditionally interpreted as dealing with the doctrines of pantheism. Illustrations of the style will be found in the commentary of H. Wilberforce Clarke on his translation of the *Dīvān* of Hāfiz,[3] where we are told that 'breeze' signifies the means whereby union with the Desired One is attained, 'bell' signifies the angel of death, 'dark night' the world, 'wave' the excess of divine knowledge, etc., whereas in some cases the same term is variously explained; thus 'narcissus' may signify the growth of the world, the pure existence of God, the vision of God, or inward results of joy in respect of deeds. These interpretations are not always very convincing; but in some works of the kind the symbolism is either interpreted by the author himself or is sufficiently clear or conventional to leave no doubt of the meaning; an example is to be found in the *Masnavi* of Jalāl al-Dīn Rūmī.[4]

The employment of symbolic acts, either to emphasize language or in lieu of it, is common with Oriental peoples, but not specially Islāmic. The same parable has a tendency to do duty through many centuries. Ibn al-Athir records (A.H. 442) how, when an Arab tribe proposed to take Kairawan, they selected as their commander a man who offered to pursue the following plan: taking a carpet, he unfolded it, and then said to the others, 'Which of you can get to the middle of this carpet without treading upon it?' They declared it to be impossible. He showed them that the carpet had to be rolled up from the edge, meaning that the country had gradually to be conquered and secured. According to W. G. Palgrave, Ibrahim Pasha obtained the command of an expedition against Nejd eight centuries after by solving the problem of the carpet.[5]

LITERATURE.—See the works quoted in the footnotes.

D. S. MARGOLIOUTH.

SYMBOLISM (Semitic).—The extent to which symbolism exists in OT literature is very doubtful. In the case of the Babylonians and Assyrians, however, our knowledge is much more definite and is obtained chiefly from a study of cylinder-seals, the Babylonian boundary-stones, and the monoliths of Assyrian kings. On the Babylonian *kudurrus*, or boundary-stones, the emblems of the gods are grouped together, and in one case the name of the god with whom the emblem is associated is inscribed by the side, thus giving us definite data on which to base our investigations.

The Hebrew word for symbol, *ôth*, is most probably connected with the root *âwâ*, 'to describe with a mark,' and with Assyr. *ittu*. Some scholars have suggested a connexion between Assyr. *ittu* and Heb. אִתִּי.[6]

1. The symbolism of religious life.—The Temple as the centre of the religious life of ancient Israel should be treated first. Solomon's temple was specifically built in order that it might contain the ark, the symbol of the presence of the deity. In the second Temple, the adytum being empty, the presence of the deity was symbolized by the continuance of the altar service, the Day of Atonement ritual, and the shewbread. Among the Semites the god was symbolically represented as a nobleman dwelling in his palace, and W. M. Flinders Petrie[1] has shown that the features and routine of Egyptian temples were similar to those of large households. First came the small chamber symbolizing the mysterious dwelling of the deity himself. The larger hall in front of this could be compared to the audience-chamber where human kings receive their subjects, whilst the larger space in front of the building was primarily a meeting-place for the people. The division of the Temple into a Holy Place and Holy of Holies was also symbolical and corresponded to the heavens and the highest heaven (שְׁחָקִים and שְׁחָקֵי שְׁחָקִים [1 K 8^{27}]), whilst the entrance may have symbolized the earth, Jahweh's footstool (Is 66^{1}). Why was the Temple built on a mountain? This really brings us to another question. Was there any connexion between the idea which represented Jahweh's home on a mountain and the 'high places' referred to in the OT? From the standpoint of the Deuteronomic historian, the high places were legitimate places of worship until the building of the Temple at Jerusalem. It is to be noted also that the high places are said to have been built on hills, and it has therefore been suggested[2] that they were artificial mounds taking the place of natural high places such as the summits of hills and mountains. The explanation of this symbolism can be learned from Babylonia. One of the most noticeable characteristics of the Babylonian temples was their enormous size. In Gn $11^{3f.}$ we read that the people meet together in the land of Shinar and decide to build a city and a tower that shall reach up to heaven. To the Babylonians a temple was above all a 'high place,' and there is a symbolic reason to account for this conception. Jensen[3] has shown that the Babylonians regarded the earth as a huge mountain. In fact the earth was actually called E-Kur, 'mountain house.' Later they began to identify one particular part of the earth—a mountain peak preferably—as the dwelling of the god, so that the temples which were built later were known as 'mountain houses.' The height of the temple thus symbolized the mountain which had formed the original home of the deity.[4] The same idea can be seen by sketching the history of Mt. Zion. The sanctuary on the mountain existed before the settlement of the Hebrews. Just as His people dispossess the early settlers of Canaan, so Jahweh dispossesses the god of Zion. Mt. Zion is now regarded as His home and He therefore reveals Himself to His people from the mountain (Ex 19^{11}). We can thus see the symbolic idea which suggested the *ziqqurats* in Babylonia, the high places in Canaan, and the sacred temple mount in Israel.

The very names 'ark of Jahweh,' 'ark of God,' suggest that the ark contained an object which in some manner symbolized the God of Israel. In the Assyrian temples a statue of the god took the place of the ark in the Holy of Holies, and it has therefore been suggested that the ark with the cherubim over it was a symbol of Jahweh. The custom of carrying about an ark as a symbol of the deity has its parallel in other Semitic religions. In Babylonia the gods were carried about in ships in solemn procession, and in Egypt the arks with their images were placed in boats. Renan[1] actually derives the Hebrew ark from the Egyptian ark-boat, but there is not sufficient evidence to warrant such a suggestion.

Cheyne[2] thinks that the symbolic meaning of the brazen serpent can be learned from Babylonia. He thinks that the brazen oxen in 1 K 7^{25} were copies of the oxen which stood in Babylonian temples as symbols of Marduk. I. Benzinger[3] has suggested that there was a serpent-clan among the Israelite tribes and that *Nehushtan* may have been its sacred symbol (Gn 49^{17}). The two pillars Jachin and Boaz which stood in front of the porch of the Temple were probably symbolical. The temple of Melkarth at Tyre and also the temple at Hierapolis had two similar pillars in front of them, and, as these were symbols of the deity and Solomon's temple was constructed on the same principle, it has been suggested that Jachin and Boaz were symbols of Jahweh. It is possible that the brazen lavers and the sea of the Temple symbolized the clouds. As to the sea and oxen, W. H. Kosters[4] finds here a symbolic trace of the Babylonian myth of the struggle of Marduk and Tiamat—the sea representing Tiamat and the oxen Marduk. Seeing that the Babylonian creation-myth determined the form of the Israelitish cosmogony, this view has received general support, although there is no direct reference to it in the OT. H. P. Smith[5] suggests that the twelve oxen were symbols of the twelve constellations and that the sea was a symbol of the great celestial reservoir from which the earth is watered. The ornamental figures on the smaller lavers he also regards as symbolical. The bull was sacred to Jahweh, the lion was sacred to Astarte, whilst the palm-tree is represented with a symbolic meaning in Phœnician art. The ornamentation therefore suggested a syncretistic purpose in building the Temple.

Although there is not the slightest reference in the OT to any symbolic meaning of the tabernacle, scholars, both ancient and modern, have suggested that both in its structure and in its appurtenances it symbolized various religious truths. The Heb. מִשְׁכָּן, 'dwelling,' expressed the idea that God dwelt among His people; אֹהֶל מוֹעֵד, 'tent of meeting,' represented the idea that God met His people there; whilst the name אֹהֶל הָעֵדוּת, 'tent of the testimony,' constantly called to mind that the decalogue inscribed on the tables of the ark bore witness to the covenant between Jahweh and His people. But there are other ideas symbolized by the tabernacle. The innermost chamber, the Holy of Holies, was the dwelling-place of the deity Himself. This could be entered by the high-priest alone, and only once a year—on the Day of Atonement. In this chamber everything was made of gold and decorated with beautifully-made fabrics, whilst the vestments of the high-priest were conspicuous by their gorgeous finery. This gave expression to the thought that God's most holy minister and His chief abode should be adorned with becoming dignity and splendour. On the other hand, in the Holy Place, which could be entered by the priesthood only, the furniture was of gold, whilst the outer pillars, which were taken, no doubt, as belonging to the court, were made of brass. The court, which was for the people, had

only brass. The covering for the Holy of Holies was made of costly materials with figured cherubim; the curtain at the door of the Holy Place was without cherubim, and that at the court was simply made of white linen. We can thus see how the costliness of the adornments of the different apartments symbolized their sacredness; the more sacred a chamber was, the more sumptuously was it adorned.

'Together the curtains are designed to form the earthly, and, with the aid of the attendant cherubim to symbolize the heavenly, dwelling-place of the God of Israel.'[1]

The sacrificial system of the Hebrews symbolized self-surrender and devotion to the will of God, the need of forgiveness, and the blessing of divine fellowship. The peace-offering with its communion-feast showed the idea of fellowship between God and man; the *tamid*, or continual offering, symbolized Israel's pledge of unbroken service to Jahweh; whilst the sin-offering with its sprinkling of blood showed that one of the conditions of cleansing oneself from sin was to place oneself submissively before God. The care taken in the preparation of the aromatic compounds of the incense suggests a symbolic meaning. From Ps 141[2] it appears that incense was regarded as a spiritual symbol of prayer. Bähr regards the shewbread as a symbol of the fact that Jahweh was ever present with His people and was the giver of their daily bread. Circumcision was a tribal badge and showed that the patient had been admitted a member of the tribe, whilst the Sabbath symbolized the completion of the work of creation. In Ex 31[13] it is actually described as an everlasting symbol (אוֹת) between Jahweh and Israel. The long hair worn by the Nazirite symbolized his consecration for some special service. In ancient religions the offering of one's hair, like the offering of one's blood, symbolized the making of a covenant between the worshipper and his god. The frontlets, or *ṭôṭāphôth* (Ex 13[16]), were badges worn upon the forehead and arm to show that the worshipper belonged to a certain religious community, and as a worshipper of the national deity was subject to His help and protection.[2] Fire occurs as a symbol of the divine presence (Ex 20[18] 3[2] etc.). It was also regarded as a purifying agent (Is 48[10]), and to pass through fire was therefore a symbol of purification. Would not this explain why sacrifices were burned before they could be accepted by God? Water was another source of symbolical purification. Ablutions were so common among the Hebrews that it is difficult to distinguish washings performed for the sake of the body and those with a symbolical significance. Anointing[3] denoted the consecration of a person or even of an inanimate object (such as the tabernacle and its appurtenances or the stone at Bethel). In Ps 92[10] it is referred to as a symbol of prosperity and joy, and the cessation of the practice was therefore a symbol of mourning (2 S 12[20]). The word *ashērāh*, which appears very often as a name for Astarte (1 K 18[19], 2 K 21[7] etc.), came to be used as a name for the symbol of the goddess[4] (Dt 7[5], Ex 34[13] etc.). The *ḥammanîm* were most probably symbols of the sun-god, who is called in Phœnician inscriptions חמן,[5] whilst the *maṣṣēbhôth* were symbols expressing gratitude for a divine revelation (Gn 28[22] 31[13] etc.). As to bull symbolism, it most probably originated among the Hebrews themselves (and was not borrowed from the Egyptians, as hitherto supposed). The Hebrews being an agricultural race, it was natural that they should look upon the bull as a symbol of strength and power. The bulls on the lavers of Solomon's temple may have been due to the influence of Phœnician workmen, for among the Phœnicians Baal was represented as a bull. The horns of the altar are regarded by some scholars as symbols of ancient bull-worship. The *ziqqurats*, or temple towers, of Babylonia consisted usually of three, four, or seven stones, no doubt on account of the symbolic sacredness attached to these numbers. The quadrilateral shape of the *ziqqurats*, with the four corners towards the four cardinal points, symbolized the four quarters over which the Babylonian kings held dominion. The lions (symbols of Nergal) and the bulls (symbols of En-lil) which stood at the entrances of Assyrian temples probably symbolized the means which the gods had at their disposal for punishing man. The names of the temples symbolized the character of the gods to whom they were dedicated. Nabu's temple was known as E-pad-kalama-suma, 'the house of him who gives the sceptre of the world'—no doubt suggested by the staff which formed the symbol of Nabu. Sin's temple at Harran was called 'the house of joy,' and that of Shamash was known as 'the house of the universal judge.' The basin of the temple known as *apsu* represented the domain of Ea, the water-god. The *ziqqurats* and the basin thus became 'living symbols of current cosmological conceptions.'[1]

We may now turn to the symbols of the gods themselves.[2] The symbol of Ramman, the storm- and thunder-god, was a lightning fork, whilst an axe represented the destruction which storm and thunder bring in their wake. His nature as a solar deity was also symbolized by a bull. Sin had a crescent, either by itself or with a disk. Since the moon at certain phases suggested the appearance of a horn, he was represented as an old man with a flowing beard, and wearing a cap on which were the horns of the moon. The horn was thus regarded as his crown and came to symbolize his power. This explains why the Assyrian kings adorned themselves with a horned crown as a symbol of divinity.[3] Anu symbolized 'the abstract principle of which heaven and earth are emanations.'[4] Such expressions as 'light of heaven and earth,' by which Ninib was known, symbolized his beneficent character as a solar deity. But the fiery rays of the sun might also be destructive, and he was therefore represented also under the form of a lion. Ea's symbol consisted of a ram's head which projected from a frame. This symbol occurs on the Bavian relief and the Esarhaddon stele. But on boundary-stones his symbol is usually an animal with the head of an antelope and the lower part of a fish. As the water-god of Babylonia, fountains were sacred to him, and he was regarded as the giver of fertility. He was the Oannes of Berossus—half man, half fish—who came out of the water to instruct the people. The symbol of a fish was therefore suggested either by the idea of fertility or by the fact that he was god of the water. Nabu, as scribe of the gods, was symbolically represented as carrying the tablets of fate and recording the decision of the gods upon them.

[2] These symbols can be studied most conveniently from the *Mémoires de la délégation en Perse*.

[3] In OT the horn was a symbol of power and its exaltation signified victory (1 K 22[11], Jer 48[25] etc.).

[4] Jensen, p. 274.

The staff by which he is represented symbolizes either the stylus of a writer or a ruler's sceptre. The solar god Marduk symbolized the sun of spring which brings about the growth of vegetation and the revival of nature. As a warrior-god his symbol is a spear, and as a storm-god he is represented by a horned dragon. Sometimes he is represented by the symbol of a dog, and in a lexicographical tablet[1] there is a reference to four dogs of Marduk. As the goddess of love and the symbol of creation Ishtar was represented by a female figure with her breasts exposed and a child on her left arm sucking her breast. She symbolized every feminine phenomenon of the Babylonian pantheon. She was the mother of the gods and the mother-goddess, and was therefore prayed to in hymns as 'helper and heavenly midwife.' As goddess of the passions she was represented on seal-cylinders as nude, with the distinctively feminine parts particularly emphasized. In the astrological system she was identified with Venus and regarded as a symbol of light. Sometimes her symbol is a star[2] of various shapes.

Nergal, who symbolized the hot sun of midsummer, was represented by a lion; Nusku, the fire-god, by a lamp; and Nirgusu by an eagle. Hommel[3] connects the name Bau with *bohu* of Gn 1, and suggests that the goddess was a symbol of the watery depths of the universe. On one of the inscriptions of Nabu-pal-iddin Shamash is represented as seated in his shrine; before him is a table resting on a wheel, and attached to the wheel are cords held by two male figures which direct its course. These figures represent the messengers of Shamash, Malik and Bunene, who occupy the position of chariot-drivers. The sun's movement across the heavens, which is here symbolized by the wheel, was thought of as a drive[4] (cf. Ps 19^6). On seal-cylinders his beneficent character is symbolized by the manner in which he pours forth streams of water from jars placed on his shoulders. But the most common symbol of Shamash is a sun-disk.

The chief symbol of Ashur was a standard which consisted of a pole surrounded by a disk enclosed within two wings. Above the disk was the figure of a warrior shooting an arrow. The terra-cotta images of Bel found at Nippur[5] represent him as an old man with a flowing beard, a real 'father' of the gods. He personified the various forces of nature whose seat and sphere of action is the inhabited world. Together with Anu and Ea, therefore, he symbolized the eternal laws of the universe.

2. The symbolism of common life.—A Hebrew slave who refused to take advantage of the liberty open to him after seven years' service had one of his ears bored with an awl and pinned to the door to show that he was in future to be devoted to the service of that house[6] (Ex 21^6). Elevation to a position of superiority was symbolized by placing a crown on the head (2 S 1^{10}, 2 K 11^{12} etc.). The worshipper spread out his hands in prayer to show that he desired to obtain divine mercy and help (Ex $9^{29.\,33}$, 1 K 8^{22} etc.). Washing of the hands was a symbol of innocence. In Dt 21^6 the heifer's neck was broken to show that the murderer deserved the punishment, whilst the elders of the city by washing their hands showed that they were free from the guilt. Hostility towards a person is shown by gaping with the mouth (Ps 35^{21}, Job 16^{10} etc.); ill-feeling by clapping the hands (Ezk 6^{11} 21^{17} 22^{13}), or by spitting in the face (Nu 12^{14}, Dt 25^9); and anger by gnashing the teeth (Ps 35^{16}, Job 16^9, La 2^{16} etc.). The key of the door was probably looked upon as a symbol of authority, and to place it upon a man's shoulder showed that he was appointed steward (Is 22^{22}). Covering a woman with one's mantle signified the intention of acting as her protector (Ezk 16^8). The father of a new-born child acknowledged it as his offspring by placing it upon his knees (Job 3^{12}). In a Babylonian poem describing the wickedness wrought by the evil spirits they are said to snatch the child from the knees of a man. The use of salt as a condiment and the piquancy which it gives to insipid articles of diet caused it to be regarded as a symbol of life. An abundance of salt has the effect of preventing the growth of vegetation, and therefore the ploughing of a city with salt denoted that it was condemned to eternal destruction (Jg 9^{45}). It was a mark of reverence to cast off the shoes on approaching a sacred person or place (Ex 3^5, Jos 5^{15}). To appear barefoot was a sign of great emotion or of mourning (2 S 15^{30}, Is 20^2 etc.), and to draw off the shoes meant to give up a legal right (Ru 4^7). The taking of an oath was symbolized by placing the hand under the thigh of the adjurer (Gn 24^2 47^{29}), or by lifting up the hand towards heaven[1] (Gn 14^{22}). As kissing was a means by which parts of the body of different persons came into contact, it was naturally a symbol of affection and reverence (Gn 27^{26}, Ex 18^7, Ru 1^9 etc.). Various symbolisms were used in mourning.[2] Sackcloth was worn to show that the mourner's grief for the departed was so great that he was ready to give up all the pleasures and conveniences of life (Gn 37^{34}, 2 S 3^{31}). The tearing of one's garment denoted that the mourner's dearest friend had been torn from him (Gn 37^{29} 44^{13} etc.). The mourner went about barefoot and bareheaded (2 S 15^{30}, Ezk 24^{17}), sat in ashes and sprinkled ashes upon his head (Jer 6^{26}, La 3^{16} etc.), and practised various mutilations of the body (Jer 16^6 etc.). Shaving the head (as among the Arabs at the present time) was also a sign of mourning. The making of a covenant was symbolized by the person who gave the pledge passing between the parts of an animal cut into pieces, and thus showing that he was ready to be similarly treated if he failed to keep his promise (Gn $15^{9ff.}$ etc.).

Light represented to the Orientals the highest human good. The most joyful emotions and pleasing sensations are described under imagery derived from light (1 K 11^{36}, Ps 97^{11} etc.). It was only natural that there should follow a transition from corporeal to spiritual things, so that light came to typify true religion and the happiness which it brings. Sin, wickedness, chaos, were represented by darkness. The lion was a symbol of strength (Jl 1^6). Kneeling was a mark of homage to a superior, and is therefore referred to as an attitude of worship (2 Ch 6^{13}, 1 K 8^{54}).

In Babylonia it was customary for the suitor to present gifts to the girl's parents. According to some scholars, this symbolized the purchase of the bride—a practice which existed in earlier times. Various symbolisms were connected with the marriage ceremony, but their meaning is obscure. The officiating ministers bound sandals on the feet of the newly-wedded pair,[3] gave them a leather

girdle, and fastened it to a pouch of silver and gold. The first of these ceremonies may have symbolized the marriage-contract between them. We are told in the Code that, if a maid behaves insolently towards her mistress, the latter may put an *abuttu* on her and reduce her to slavery. The adoptive parent may do the same with a disobedient son. What the *abuttu* was is unknown. Jensen has suggested that it was some kind of incised mark which acted as a symbol of the person's position (cf. the mark on Cain's forehead [Gn 4[15]]). The repayment of a debt or the dissolution of a partnership was symbolized by the breaking of a tablet. Mutilation is often referred to as a punishment for crime, and the form of mutilation was symbolical of the offence itself. For striking a father the hand was cut off; for ingratitude evidenced by speech the tongue was cut out; as a punishment for unlawful curiosity the eye was torn out; and as a mark of disobedience the ear was often cut off. The cutting short of the hair was a mark of degradation. The city walls were regarded as a symbol of shelter.[1] Swearing by the gods and the king was a means of sanctioning an agreement. When a contract was made, both parties and witnesses added their names to it. And this was authenticated by impressing their seals or making a nail-mark. The Code states explicitly that a woman was not a wife without 'bonds.' This was a marriage-contract which symbolized an official acknowledgment of the union. An artisan symbolized his adoption of a child by teaching him a trade. The penalty of breaking a contract was the payment of two or more white horses to the god. The exact meaning of this symbolism is unknown, but white no doubt suggested purification and innocence. In Babylonian magic there was a symbolical tying and loosening of knots according as the sorcerer wished to strangle his victim or to release him from any demon by which he had been captured. If a magician wished to rid himself of an object, he would burn or torture an image of it, believing that the victim would meet with the same fate as his image. By 'seizing the hands of Bel,' the Assyrian kings legitimized their claim to the Babylonian throne.

3. The symbolism of numbers and colours.—It is doubtful whether the Hebrews used numerical symbols in OT times. On the Moabite Stone and the Siloam inscription the numbers given are invariably in words. But this does not exclude the possibility that numerical symbols, which were employed by the Babylonians and Egyptians, were also used by the Israelites. In S. Arabian and Phœnician inscriptions also the numbers are partly written and partly indicated by figures. The numbers most commonly used with a symbolical meaning are three, four, and seven.[2]

White symbolized purity and innocence. It represented light, which impressed the Hebrew mind not only by its brilliance and beauty, but by its divine symbolism and profound moral connotation (Lv 16[4, 32], Dn 7[9], Ps 104[2]). As black absorbs all colours and thus buries the light, it symbolized death, humiliation, mourning (Mal 3[14], La 4[8] etc.). Blue, representing the colour of an unclouded sky, symbolized revelation (Ex 24[10]). It was the first of the colours used for the curtains of the sanctuary, and the Israelites were commanded to have a ribbon of blue fringe on the edge of their garments in order to remind them of Jahweh (Nu 15[38f.]). Red, as the colour of blood, represented bloodshed, war, guilt (Zec 6[2]). Purple was the distinguishing mark of royalty, representing dignity and honour (Est 8[15], Jg 8[26]), whilst green, as the colour of plants—growths to which people look forward in winter—symbolized hope and resurrection.[1] It was also the symbolic colour of the moon.[2]

4. Special symbolisms in OT.—Ahijah tore his garments into twelve pieces in order to show that the kingdom of Israel would be similarly divided (1 K 11[30-32]). One of the sons of the prophets asked his comrade to smite him, and by his wound thus showed the punishment that Ahab had deserved (20[35]). Zedekiah, a false prophet, put on horns in order to show that Ahab would push the Syrians as with horns of iron (22[11]).

In considering the special symbolical actions of the prophetic books, we are confronted with very great difficulty. For scholars are divided in their views as to whether these actions were actually performed in their literal sense or were merely conceived as symbolic visions in the minds of the prophets. It seems almost certain that there are a number of such actions which could not have been performed literally. It is impossible, however, for the present writer to discuss in this brief article the category to which each of these many prophetic symbolisms belongs. But a brief discussion of some of these from the books of Jeremiah and Ezekiel may give some indication as to the difficulties in arriving at a definite decision. In Jer 13[1-11] Jahweh tells the prophet to go to the Euphrates and hide his linen girdle in a rock. After a while he is told to remove the girdle, and he then finds it to be marred. The lesson is that, just as a girdle from its nature clings to a person, so Israel is closely united to Jahweh.

Now, on the one hand, it may seem unlikely that Jeremiah should have undertaken a journey from Jerusalem to Babylon—a distance of about 200 miles—in order to bring out this point to the people. But it is possible that the journey *was* actually performed. (1) We know that the prophet was absent from Jerusalem during part of Jehoiakim's reign, and, as we have no account of his whereabouts during this period, it is possible that he made the journey to Babylon then. (2) In Jer 39[11f.] we are told that Nebuchadrezzar behaved in a most friendly way towards him on the capture of Jerusalem. This can be explained by the suggestion that king and prophet had met previously, and that it was on the occasion of the prophet's visit to Babylon. In Ezk 4[5] we are told that the prophet lay upon his side for 390 days. How can this be taken literally? Did any person actually count the number of days? In 4[12] we are told that Ezekiel used human excrement for fuel in baking some barley cakes. Surely it cannot reasonably be suggested that the prophet would have inconvenienced himself by going to such extremes merely in order to bring home to the people some divine message which he could very well have preached in a much more suitable manner. There are some scholars, chief of whom is A. Klostermann, who argue that these symbolical actions *were* performed. The dumbness of Ezekiel (3[24-27]), they suggest, was due to a temporary loss of speech, and they explain similar performances by somewhat similar suggestions. Against this it may be argued that the prophet here refers to his keeping silent from delivering any prophetic message rather than actual speechlessness. Again, the fact that the prophet had to remain at home, in order to carry out the divine command, suggests

[1] The Code says that, if a father repudiates his son, 'he shall leave house and yard.' 'Yard' simply means 'enclosure' and may refer to the city walls, as a symbol of shelter (C. H. W. Johns, *Bab. and Assyr. Laws, Contracts, and Letters*, Edinburgh, 1904, p. 42).
[2] Cf. art. NUMBERS (Semitic).

[1] Hammurabi says that he 'bedecked the grave of Malkat with green,' the colour of resurrection (introduction to his Code of Laws).
[2] Jeremias, i. 110.

that it was not loss of speech but an injunction to refrain from reproving his co-religionists any more. The present writer is therefore inclined to agree with R. Smend, A. Kuenen, and E. Hühn in regarding many of the symbolisms of Ezekiel as being merely symbolical visions in the mind of the prophet and as not having been performed externally.

LITERATURE.—Very little indeed has been written by modern scholars on OT symbolism. Among the older works the most important is C. Bähr, *Symbolik des mosaischen Cultus*, 2 vols., Heidelberg, 1837–39. For discussion of prophetic symbolism by modern scholars see F. Giesebrecht, *Die Berufsbegabung der alttest. Propheten*, Göttingen, 1897; F. E. König, 'Zur Deutung der symbolischen Handlungen des Propheten Hesekiel,' in *NKZ* iii. [1892]; E. Hühn, *Die Messianischen Weissagungen*, 2 vols., Tübingen, 1899; W. Nowack, *Die kleinen Propheten*, Göttingen, 1897, p. 29; F. Delitzsch, *Iris: Studies in Colour and Talks about Flowers*, Eng. tr., Edinburgh, 1889.

For a study of Babylonian symbolism see W. J. Hinke, *A New Boundary Stone of Nebuchadrezzar I. from Nippur*, Philadelphia, 1907; W. H. Ward, *The Seal Cylinders of Western Asia*, Washington, 1910; P. Jensen, *Die Kosmologie der Babylonier*, Strassburg, 1890; K. Frank, *Bilder und Symbole der babylonisch-assyrischen Götter*, Leipzig, 1906; J. de Morgan, *Mémoires de la délégation en Perse*, Paris, 1900–05, vii. 137–153; F. Hommel, 'Ursprung des Tierkreises,' in *Aufsätze und Abhandlungen*, Munich, 1900, ii. 236–268.

MAURICE H. FARBRIDGE.

SYMBOLO-FIDEISM.—Symbolo-fideism[1] is the name given to the theology taught in the second half of the 19th cent. at the Protestant Faculty of Paris by Professors Auguste Sabatier and Eugène Ménégoz, and disseminated since by a large number of their pupils and disciples. It has also been called the theology of the Paris school.

As its name indicates, this theology has two aspects: (*a*) symbolism, which deals with religion more particularly from the point of view of its form, and (*b*) fideism, which deals with it from the point of view of its content. Sabatier devoted himself specially to the former and Ménégoz to the latter aspect. But the two conceptions are inseparable and interdependent. Together they form a theology with a distinct character of its own.

The basis of symbolism is the psychological observation that the essence of things escapes us, and that we know only their manifestations in the form of images, figures, and symbols. We cannot, *e.g.*, know what God is in Himself. We know Him only by the more or less anthropomorphic representation which we form of Him in our thought. This we express by the terms 'Father,' 'Lord,' 'Master,' 'Captain,' 'Sovereign,' 'King,' or by emblems bringing out one or other of His attributes—*e.g.*, Lion, Rock, Banner, Fire. These symbols are without doubt the expression of a living reality, but the conformation of our brain is such that it cannot grasp that reality naked; our mind can apprehend it only when it presents itself in the garment of a more or less sensuous representation. This observation holds good in regard to all religious data, and is borne out in the most subtle dogmatic systems. The task of the theologian is to lay bare the eternal truth from under its contingent manifestations and its historical formulæ; moreover, these formulæ are subject to the laws of historical evolution.

As regards the Deity, it is the name 'Father,' habitually used by Jesus Christ, that best suits the religious man's conception of the Supreme Being—perfect, just, merciful, eternal, all-embracing; a Spirit both transcendent and immanent, on whom man feels himself absolutely dependent, while at the same time conscious of liberty and responsibility before Him. On the ideas of liberty and responsibility depend those of sin and penalty, which in turn suggest those of pardon and salvation. A lively conviction that we are created for life and not for death, for happiness and not for suffering, rouses us to aspirations after salvation. We desire life, happy life, eternal life. The whole idea of salvation is summed up in these words.

How are we to attain this life, this salvation? Conscience replies: By the pardon of our sins. But how is pardon to be obtained? It is with this vital question that fideism is concerned. The term 'fideism' (Lat. *fides*, 'faith') was employed in the religious sense for the first time by Ménégoz in his *Réflexions sur l'Évangile du salut*.[1] Its meaning is most concisely indicated in the phrase: 'We are saved by faith, independently of beliefs.'

The distinction between faith and beliefs is one of the fundamental premisses of fideism. By faith is meant the movement of the self towards God—a movement which implies forsaking sin, repentance. The man who repents and gives his heart to God is saved, whatever his beliefs may be. This statement is opposed to the old orthodoxy, which made adherence to certain official dogmas a condition of salvation. Fideism declares that a man is saved by faith alone (*'sola fide'*). At the same time, it recognizes the value of doctrines. Doctrines are dynamic ideas which make for good when true, and for evil when false. Fideists regard them therefore as pedagogic instruments of the first order. It is for this reason that they attach so much importance to the pursuit of truth and oppose so resolutely doctrines which they consider erroneous. It is only through a great and regrettable misunderstanding that their opponents reproach them with indifference to doctrine; and it is also false to assert, as has been done, that fideists fail to appreciate the intellectual factor in religious faith. Faith, according to their teaching, is an activity of the self in its unity, and therefore must comprise all the elements of the soul's faculties—thought, feeling, and will. But the essential factor in salvation is the inward movement towards God, not intellectual adherence to some doctrinal tenet. Fideists reject the doctrine of salvation by beliefs without thereby denying the spiritual influence of beliefs, as the Reformers rejected the doctrine of salvation by works, while maintaining that good works are obligatory on Christians.

In a general way, and as a result of historical, critical, exegetical, and philosophical studies, fideists have departed from orthodox theology and returned to the simple doctrine of salvation as taught by Jesus Christ, according to their interpretation, to the multitudes in His preaching of the gospel; hence their emphasis on repentance and on consecration of the soul to God as conditions of salvation.

As regards the idea of salvation, they find it in the symbolic interpretation of the primitive Christian conception of the Kingdom of God. This idea has for them two aspects: (1) the entrance of believers at death into celestial happiness, and (2) the gradual establishment of the Kingdom of Justice and Peace on the earth. These two ideas combined constitute in their eyes the Kingdom of Heaven.

The name 'Symbolo-fideism,' which expresses the union of symbolism and fideism, gained currency from two articles by Eugène Ménégoz, signed T. P. ('Théologien protestant') in the *Église Libre* (1894, nos. 31 and 33). Auguste Sabatier accepted this title (*Esquisse*, p. 456). It passed into Holland with the thesis by J. Riemens entitled *Het Symbolo-fideisme: Beschrijving en kritische Beschouwing* (Rotterdam, 1900), and into Germany with Gustav Lasch's *Die Theologie der Pariser Schule: Charakteristik und Kritik des Symbolo-Fideismus* (Berlin, 1901).

Symbolo-fideism has given rise to numerous controversies, an echo of which is found in current

[1] In recent years the word 'fideism' has frequently been used alone.

[1] Paris, 1879, § 44.

religious journals and theological reviews. Its adversaries have also published a number of polemical pamphlets. These are referred to in the writings mentioned below.

LITERATURE.—The two principal works of Auguste Sabatier on the subject are the *Esquisse d'une philosophie de la religion d'après la psychologie et l'histoire*, Paris, 1897 (several times re-edited), Eng. tr., London, 1897, and *Les Religions d'autorité et la religion de l'esprit*, Paris, 1904 (published from MS, after the death of the author), Eng. tr., London, 1904. The writings of E. Ménégoz are collected in *Publications diverses sur le fidéisme et son application à l'enseignement chrétien traditionnel*, 5 vols., Paris, 1900–20. The reader will find in these works references to other works of the same authors. See also Hector Haldimann, *Le Fidéisme; Etude critique de la doctrine du 'Salut par la foi, indépendamment des croyances,'* Paris, 1907; E. Ménégoz, *Religion and Theology*, London, 1908; *Le Salut par la foi, indépendamment des croyances: Anthologie du fidéisme*, by the Comité des publications religieuses libérales de Genève, Geneva and Paris, 1913; A. Delcourt, *Le Fidéisme: La notion intégrale du salut et l'essence de l'Évangile*, Paris, 1914. A. Thiébaut has given an objective and critical exposition of fideism in the *Journal religieux des Eglises indépendantes de la Suisse romande*, 1917, nos. 23–26.

EUGÈNE MÉNÉGOZ.

SYMPATHY.—Sympathy, as the etymology denotes, is 'feeling with' others. Two persons feeling alike do not, however, make a true sympathetic couple unless the feeling of one has partly caused or is reinforcing the feeling of the other. The perfection of mutual sympathy is reached when similar feelings originate spontaneously in the two and reinforce each other. Any relation, however, in which there is a mutual reinforcement of feeling, however originated, is one of mutual sympathy.

1. Emotional contagion.—The primary fact in sympathy is that the feeling of one person can, on occasion, cause similar feeling in another. In its primitive manifestations this occurs without reflective consciousness of the feeling, and certainly without distinction of persons in respect of its origin. This is shown in the contagion of popular excitement—*e.g.*, panic, war-frenzy, the intensified enthusiasm of public meetings, the wild joy, the furious hatred, the boundless affection, that mark the excited crowd. The emotion, or its manifestation in some, excites similar emotions latent in the others, and forthwith by sympathetic reinforcement the emotional disturbance in each is abnormally increased. Probably it is only those who, from the beginning, have some set against the prevalent emotion that maintain a normal level throughout. Such sympathetic outbursts must be themselves short-lived, and, as the cause of excitement is withdrawn, the persons affected by contagious feeling return to their ordinary emotional level. This may even be one of indifference to the popular frenzy in which they took part. It may, indeed, be one of revulsion if they have been drawn, as sometimes happens, into a condition of which in their normal moods they disapprove. Such revulsion would happen, *e.g.*, if an advocate of peace found that he had been drawn by fellow-feeling into a demonstration of war enthusiasm. The hot fit is followed by a cold fit. Hence the instability of popular acclamation, the apparent superficiality of feeling which appears when people liable to sympathy of this primitive unreflective kind are massed together. The most suitable material for the typical 'fickle mob' is a town population sympathetically sensitive and intellectually immature.

The short-lived character of the feeling thus contagiously aroused follows in the nature of the case, because there is no settled identification of self-conscious personality with it. I feel in a sense, but do not feel myself as feeling: I do not take the feeling into myself as mine. It is *on* me and moves me, but it does not enter into any relation to that total of ideas, impulses, feelings, and desires which is *me*. It may be a mere motive excitement, moving me blindly to action, or it may take possession of me completely with fixed idea and over-mastering mood, acting instead of me and overpowering me. In either case I come out of it, and in the latter case as one recovered from a madness. Something like this, no doubt, befell Parisians in the brief violence of the Terror.

2. Self-conscious sympathy.—When self is identified with the feeling which nevertheless is ascribed to another person as origin, we have sympathy proper. The development of self-consciousness goes hand in hand indeed with the exercise of sympathy. We learn to know ourselves, and to become all that we are capable of becoming as self-conscious persons, by our dealings with our fellows, and *pari passu* with our consciousness of them as other selves. In so far, however, as we are clearly conscious of self, we are prepared to set bounds to the operation of primitive sympathy. A new condition of feeling, discontinuous with my previous state so as to preclude its origination in me, is roused in me by sympathetic contagion. It is to the self an invasion from without. As a feeling, moving me but not mine, it must be referred to a neighbouring conscious self, who is manifesting it independently. Our first concern, however, is its treatment by the self which is invaded. Feelings that harmonize with the total state of this self enter into it as elements in its development: the sympathy of children with parents and other elders plays a large part in the building up of their personality. Confidence in the elders who give the lead to sympathy predisposes to acceptance of their guidance. The emotional being of the child is educated in this way. If of average docility, it takes the form suggested to it by its society. On the other hand, the suggested feeling may be out of harmony with the character as already formed: thus the brave man may feel the horror communicated to him by the panic-stricken multitude, but he overcomes it as no possible part of himself. When the feeling thus communicated to us takes strong hold, the repulse by a strong character is correspondingly emphatic. In sensitive natures this gives rise to a peculiar sense of revulsion, as towards something put into us against our will; and the transference of this revulsion to the source of contagion is probably the chief cause of violent personal antipathy. Between this attitude of abhorrence towards the induced emotion and willing receptiveness of it, as extremes, lie all degrees of being moved by a feeling from which, as outside the disposition of our own personality, we nevertheless withhold ourselves. Whether we admit the feeling to influence over us, or harden our will against it in a sort of self-defence, it appears to us essentially, and throughout its action, as the feeling of another person with which in a measure we feel. This definite ascription of the feeling to another is the second characteristic feature in sympathy, and gains prominence with the developing consciousness of self and of other selves.

3. Control of sympathy.—In passing it may be noted how large a part in life is played by the partial hardening of the heart against the contagion of social feeling. This control of sympathetic distraction in general belongs to the preservation of self as maintenance of character. It is not only that undesirable emotions—*e.g.*, of hatred, fear, envy—should be suppressed, as they are by the self-possessed though sensitive members of the excited crowd.[1] Experience soon reveals that the preservation of self, even in the ordinary physical

[1] Common self-possession, as in the man who is not liable to the contagion of feeling, must be distinguished from the subtle excellence of sympathy under control. Probably this is one of the qualities of the born leader.

sense, requires much systematic control of emotion, whether initiated sympathetically or otherwise. An emotional nature loosely controlled is morally unstable and makes for a nervous break-down in course of time. This is the hysteric type, so far as it depends on moral character. It is a main principle of moral health that the emotional life as it increases should be kept more and more strictly in subordination to the ends which it subserves. The precise definition of those ends belongs to the subject of ethics: the average man conceives them simply as the happiness of personal health for himself and his associates, together with some service in furtherance of the common weal. It may be that the rank and file of modern humanity suffer from lack of vitality and variety in the emotional life, but for the moment we are not concerned with them. Persons of the sympathetic cast are—under modern conditions more especially—liable to so much emotional invasion as must result in nervous exhaustion if not systematically kept in check. It is interesting to note how the habit of control over sympathy develops with experience from youth to maturity: the first great sympathetic grief overwhelms us as if it were our own; later we have learnt to throw ourselves outside the emotion into the actions required to assuage the sufferings of our friend; later still, to those who are overtried, callousness may come, with the exhaustion of either physique or morale.

Most of these observations apply to all feeling, however initiated. Sympathetic feeling differs from other feeling as being specially liable to increase of control by development of the element of otherness in it. This is of a piece with another useful psychological truth, namely that the tension of any violent feeling may be relieved by treating it as an object of imagination or thought. Tennyson's lines bear on this point:

> 'Likewise the imaginative woe,
> That loved to handle spiritual strife,
> Diffused the shock thro' all my life,
> But in the present broke the blow.'[1]

In constructing a story, an essay, or a poem which depicts the emotion as affecting imaginary persons, the sense of its personal attachment is obscured: it is projected more or less, *i.e.* thrown out of self-consciousness into the non-ego. Similarly, but as of course and instinctively, we project our sympathetic feelings back into the other self and, although still feeling them, are as a rule much relieved. This relief is no doubt chiefly due to the stop that is placed on the disturbance of the emotional personality in general by the sharp dissociation of the new feeling from those immediately pertaining to the self: it is the other person's feeling, and, though it disturbs me, I limit that disturbance by *knowing* it as something which has not its origin, and is therefore not necessarily permanent, in me. This control of the sympathetic disturbance furthers and is furthered by practical activity in relief of the other's distress.

4. Identification with the 'other.'—The exceptions indeed in this case explain the rule. When the sympathetic feeling is ascribed to a person much beloved, it may affect us more than if it were of our own origination. This, no doubt, is what is meant when it is said that another person is dearer to us than ourselves. The consciousness of the beloved person's consciousness is in this case so established as part of our own that the projection of the feeling into it does not in the least dissociate the self from the feeling. So far as we know what the beloved person feels, we go on feeling it and being further disturbed by it all the time. Indeed there appear to be, in cases of intense affection when the self identifies itself passionately with the other, two ways in which the sympathetic feeling may become more disturbing than the equivalent primary feeling would be. (1) In projecting it on the beloved other, imagination, moved by the habit of affectionate concern, may greatly exaggerate its force and significance: the finger-prick which, in spite of instinctive tears, is a trifle to the baby may bulk large in the distressed imagination of the anxious mother; and the same kind of thing happens in a thousand hidden ways when love prevails, and it happens for pleasure as well as for pain. (2) Each person has an intimate sense of the powers and resources within himself by means of which he bears his troubles and controls his emotional being generally. About the beloved other, however intimately known, he is never quite so sure, and thus, no matter how equal things may otherwise be, the sense of mystery breeds, as it were, a germ of fear that heightens pain and, by release from it, also heightens joy. This goes, moreover, with the essential fact that love at its strongest exceeds self-love in desiring the welfare of its object. The heightening in this way of feeling sympathetically experienced may perhaps be discriminated introspectively as an additional element of anxious concern about subjective consequences. Such concern is given to their own emotions by none but morbid people. And indeed even in the lover-like relation to which this tender anxiety naturally belongs it may be so exaggerated as to be morbid concern of self for the other. For this reason it is often well that persons who get too much on one another's mind—as we say—should be sometimes separated.

[1] *In Memoriam*, lxxxv.

The absence of this intimate affection in the case of ordinary associates makes it possible to limit the sympathetic disturbance by instinctively projecting it back into the other mind, consciousness of which is only now and then associated with the consciousness of self. There are, of course, all degrees of dependence on one another in this respect. A man may go through life without one associate in whose welfare he has any genuine lasting interest, capable of sympathy but never in danger of being shaken by it. Most persons, however, have friends sympathy with whom does penetrate into them, as well as move them out of themselves. Some men are, in the absence of contrary cause, friendly to all their associates: these are universally sympathetic also, in proportion to their primary sympathetic sensitiveness. Friendliness, however, as the disposition to identify oneself with another, must be carefully distinguished from the primary capacity to feel as others feel.[1] When they are combined, we have the sympathetic nature as popularly understood. But an unfriendly man may be sensitive to another's feelings, in which case he not only projects them on the other but sharply dissociates himself from all interest in him. It is as if he said, 'I know what you feel; I feel you feeling it; but it is nothing to me.'

5. Insight and sensitiveness.—Apart from unfriendliness, however, this cool dissociation of self from interest in the other, combined with sympathetic sensitiveness, explains the gift of neutral or cold insight which plays so large a part in the intuitive knowledge of men. Intellectual constructiveness, which bodies forth an idea of the man's character as shown by his actions, is the ordinary substitute for intuition; and in some ways it is a safer guide. The intuitionist, *e.g.*, may mistake his man by overestimating the significance of a transitory mental attitude. He is also likely to eke out his intuitions by specula-

[1] Friendship is in its degree the affectionate interest in another's consciousness of which the extreme has been described, and friendliness is the disposition to be so interested.

tions and imaginings into which all sorts of error may creep. If he abounds in self-confidence, he is a dangerous guide: but, if he treats his gift humbly as a useful auxiliary, it will serve him in good stead and improve with such exercise.

A person of sympathetic bent may have experiences of cool insight, but with this difference that, since in such case he does not identify himself with the other, he is moved to change the state of the other into identification with him. Thus the orator feels that his audience is puzzled or hostile: they do not convert him, but he is not indifferent, so he puts out his strength to express himself and make them feel his feeling. The mere lecturer, on the other hand, only tries to show and make them see his meaning. The orator is the speaker whom the Americans call 'magnetic': he makes his hearers feel as he does, at least for the time. But the beginning which he makes is at the other end of the coil, by insight into the feeling which is theirs but not his. This is the getting into sympathetic touch. By showing this sympathy on neutral ground or even in respectful dissent, he fixes the attention of his hearers. His interest in them interests them in him: then the position is reversed, the mind of the speaker shown, and the original attitude of the audience merged in the new state by which they are identified with him. This kind of thing happens every day on a small scale in the experience of sympathetic people. To understand, to be interested though in disagreement, to persuade—these are the means, and in this order, by which one person transforms the mental attitude of another. The more instinctive the process is, the better, sympathy operating in the pair by its natural impulse to mutual identification of mental content.

6. Affinity of character.—In so far as the sympathetic bent in the full sense turns upon friendliness of disposition, persons may be characterized as sympathetic generally, *i.e.* in relation to all sorts of other persons. In so far, however, as it depends on primary contagiousness of feeling, affinities of character must profoundly affect the relation between any pair. Racial type, *e.g.*, is a basis of such affinity, and the mutual intelligibility of two compatriots, while partly arising from like habits of expression and community of associations, turns also on functional capacity to feel alike. In whatever way we explain the prime fact of emotional contagion, it is evident that no one can communicate to another a feeling of which the latter is constitutionally incapable. The fearless man cannot feel like the coward, nor the liberal man like the mean. Each can only see that the other acts in a manner directly opposite to himself and recognize the corresponding state of mind as a mystery. To sympathize with another, we must be *able* to feel like him. Some would say, further, that we must have felt on our own origination as he now feels; but that is not so certain, though perhaps it generally happens so. Our capacity to sympathize, therefore, is at least limited by the possibilities of our character. How far these are limited, or how far they may be extended beyond our present experience of them, we never know. Certain it is that in human society we run up now and then against mysteries, persons with whom after much acquaintance we never get in touch, who always seem to us as if they were feeling their way through life at the other side of a high wall over which we cannot see, through which we cannot hear, them. At the same time, we meet others with whom, in trifling things and large alike, we find ourselves in tune, so much in tune that diversities of aim and opinion, though standing out the more clearly, do not mar the general harmony. But mental conditions are so complex that likeness of condition between two minds must generally be of a very partial kind.

7. Similarity and association.—Another influence to the same effect which enters into these cases is natural similarity in habit of expression. This is best seen in racial affinity: the stock of native gesture due to heredity, including facial expression, intonations of voice, and a multitude of tiny movements, felt rather than seen—all are available for that involuntary play of subtle signs which is the veiled language of sympathy. Whether contagion of feeling originates with instinctive imitation of feeling-signs or not, its development in relation to the complex psychoses of the adult is dependent on the swift interpretation of their secret signs. Human beings are indeed so profoundly interesting to each other when they really show themselves that an easy mutual intelligibility is often almost equivalent to friendship at first sight.

Intelligibility follows also on intimate association, and this is favourable to the sympathetic relation. A common stock of experiences, habits, and even feelings is formed by association in life, and the result is similar to that of congenital affinity, though lacking the charm of its ever-recurring unexpectedness. Congenital affinity, it should be noted, is not limited to cases of similar racial type. It is a happy accident of human development which may be encountered at any turn.

8. Sympathy in education. — The value of sympathy as an element in the development of moral life is too large a subject to be treated here. A few words, however, may be devoted to (1) the teacher's use of sympathy in education, and (2) the training of sympathy in the child.

(1) The teacher's use of sympathy, like that of the orator described above, begins in his own sympathy with the learner's state of mind and ends in the achievement of the learner's sympathy with his. The teacher's sympathy requires as a starting-point, therefore, some demonstration on the child's part, and to evoke this in as good a form as possible for his purpose—but in any form rather than none—must be his first care. By entering into the child's mind thus shown to him he establishes the contact of sympathy, and by maintaining this contact he leads where he will, provided he keeps to the possible levels of the child throughout. It is not so much in regard to the method of individual lessons as in respect of his general procedure and influence that the teacher's tact is shown. A mistake of intellectual method is a small matter compared with an error in the procedure of moral discipline. It is quite possible to keep in touch with the child's sympathies, even when punishment seems to estrange him for a time.

(2) In the training of sympathy the first requisite is to encourage its manifestations when they occur spontaneously, and to suggest conduct which is the natural expression of interest in others. The tendency to sympathize with joy as well as with sorrow—*Mitfreud* as well as *Mitleid*—should be called out. All this belongs to the development of the sympathetic nature, which, however, also stands in need of disciplinary training. This, for the most part, life supplies, and the educator should be wary lest he interfere unwisely and too much. The delicate process of control and moderation by which each self sets limits to its sympathies had better be left to itself; and, as a rule, it is dangerous to train the young to repress, otherwise than by more fully expressing, their nature. Wise discipline trains to the control of one function for the sake of fulfilling another more perfectly. Thus, emotion is in general controlled by using it to subserve the voluntary and intellectual life.

Thought and conduct are the antidotes to hysteria and emotional riot. As regards sympathy in particular, we should be chiefly concerned to develop first its voluntary and, second to that, its intellectual side. The barren sympathy with suffering, *e.g.*, which does not go on to some comforting act is morbid because it ends in useless emotional disturbance. Doing in accordance with the occasion is the habit to which sympathy should be most carefully trained. Its other requisite is that it should be intelligent, and this is often a much-needed lesson. A useful sympathy with others requires imagination and reflexion sufficient to construct a true ideal of what they want. This intelligent apprehension of another's case is of inestimable value in making the fellow-feeling, as well as the friendly action, fit.

Persons who are 'too sympathetic to be of any use in trouble' are persons who, by neglecting to help their fellows as need arose, have let themselves get into a habit of being overwhelmed by painful fellow-feeling. The remedy is to do something for the prime sufferer. This is the natural course in the case of an unspoiled will.

SYNAGOGUE, THE GREAT.—See JUDAISM, vii. 593 f.

SYNCRETISM.—1. Untechnical use of term.—The term 'syncretism' has a very curious record. It is as old as Plutarch, who seems to have coined it, or at any rate to have made it current. In his essay on brotherly love[1] he observes that even brothers and friends who have quarrelled prefer to associate with one another, in face of a common danger, rather than to fraternize with the foe; which is a Cretan precedent and principle,

'for, although the Cretans were frequently at faction and feud with one another, they became reconciled and united whenever a foreign foe attacked them. This they called "syncretism" (*συγκρητισμός*).'

By 'syncretism,' in this political sense, therefore, we are to understand the instinct of self-defence which sinks private differences before a threatening peril on the outside. The 'syncretists' close their ranks; they like quarrelling among themselves, but they would rather exist than indulge in fatal internecine strife at home.

After Plutarch the term became submerged. Fourteen centuries later it re-appears in the pages of Erasmus, who was in his own way, especially when the way ran through the *Adagia*, a 'syncretist' of the reconciling order, averse to feuds. Erasmus sets down the reference to Plutarch, and he also employs the term in his correspondence.

Thus we find him writing from Louvain (22nd April 1519) to Melanchthon, hoping that scholars of all parties will close their ranks against the barbarians: 'Vides quantis odiis conspirent quidam adversus bonas literas. Aequum est nos quoque *συγκρητίζειν*. Ingens praesidium est concordia.'[2]

During the next century and a half the term is tossed about Europe by members of the Reformed and of the Roman Church, sometimes as an appeal, more often as a taunt; theologians who endeavoured to reconcile extremists were dubbed 'syncretists,' and 'syncretism' was indifferently and acrimoniously applied to all irenical proposals, whether these were the product of a Laodicean indifference or of a genuine love for moderation. In passing from the humanists to the theologians, the term upon the whole acquired disparaging associations, which continued to cling to it. 'Syncretist' became almost a synonym for 'hybrid.' It was derived from *συγκεράννυμι*, and the supposed etymology corroborated the connexion of the term with all that was heterogeneous.

This is the predominant meaning of the term in ordinary French. In untechnical English it also denotes 'fusion' of a more or less illegitimate or artificial kind. Thus Hallam[1] says of Giordano Bruno: 'What seems most his own . . . is the syncretism of the tenet of a pervading spirit, an Anima Mundi, which in itself is an imperfect theism, with the more pernicious hypothesis of an universal Monad.'

2. Philosophical and ecclesiastical applications.—In the history of philosophy 'syncretistic' has been applied to the harmonizing efforts of those who, like Cardinal Bessarion in the 15th cent., refused to allow their love of Plato to be identified with any depreciation of Aristotle. The controversy between the Aristotelians and the Platonists had been sharpened by the impetus given to Platonic studies after the fall of Constantinople. Partisanship ran strong, and the more moderate men failed to draw the rival schools together.

'Throughout all the tangles of this complicated controversy, a thread of gold is interwoven by the serene and imperturbable temper of Bessarion.'[2]

What happened in 15th cent. philosophy was repeated on a larger scale in the theology of the 17th century. The 'syncretistic controversy' of that age rose out of the efforts made by G. Calixtus (1586–1656), a distinguished scholar at Helmstädt, to draw the Lutheran and the Reformed Churches together. 'A plague o' both your houses,' he cried, like Mercutio. But it was Mercutio's dying cry of indignant protest. Calixtus lived and worked to check the plague. He was acutely sensible of the harm and danger to Christianity which the sharp internal divisions within the Church produced. But his broad, catholic temper met with little response among his contemporaries. The controversy lasted even after his death, assuming political as well as theological forms. The 'syncretistic' party in the Church failed, however, to carry its principles into effect. Even well-meaning and wise attempts to emphasize the fundamental Christian principles held by various Reformed Churches, or by all the Reformed Churches in common with the Roman Church, were suspect in that age of hardening division and widening cleavage. Men were told that in view of the Roman peril they would be well advised to subordinate their private idiosyncrasies in the Reformed Church; or Christians in both Churches were reminded that the menace of outside heathenism should make them close their ranks. But 'syncretism' of this kind was generally branded as a betrayal of principles or as an attempt to secure unity at the expense of truth. The 'syncretistic controversy' was a quarrel over peace, and such quarrels are not the least bitter upon earth. What the 'syncretists,' in Plutarch's sense of the term, called a harmony, their opponents called a 'hybrid.'

The Roman Church had a 'syncretistic' controversy of its own, an eddy in the turbulent dispute over the relations between grace and free will, which poured from the last quarter of the 16th century.[3] 'Syncretic' is the term applied to the system of belief which endeavours to harmonize the conflicting views of the Thomist and the Molinist parties by assuming two sorts of efficacious grace, which are held together by prayer.

3. In comparative religion.—'Syncretism,' as men like Calixtus and Zwingli used it, still retained something of the practical sense which

[3] Cf. *CE* iv. 238 f., vi. 718 f.

Plutarch had originally attached to the expression. But this is lost in the technical, modern application of the term to a phenomenon in the history of religion, *i.e.* to the fusion of various religions in doctrine or in cult. Here 'syncretism' denotes generally an unconscious, wide-spread tendency, due to or fostered by some re-adjustment of political relationships or by some clash of civilizations. There is a blending of religious ideas and practices, by means of which either one set adopts more or less thoroughly the principles of another or both are amalgamated in a more cosmopolitan and less polytheistic shape. Such movements in the religious world are often preceded and accelerated by a new philosophical synthesis as well as by a political re-arrangement, but the outcome invariably is a unification of deities, which, as J. Toutain has pointed out,[1] proceeds on one or other of two lines: either two deities of different religions are assimilated by comparison or several deities are grouped together in a fresh synthesis. The motives for this re-statement are drawn from the dawning consciousness that any particular form of religion is no longer adequate by itself, that others possess like features, possibly of superior efficacy and appeal, and that such features can be incorporated without detriment to the essential principles of the particular religion in question. The study of comparative religion exhibits this phenomenon in a variety of shapes and stages, but it is specially prominent during the first four centuries of the Christian era.[2]

The tendency to this syncretism or amalgamation of deities and cults had been in operation long before the rise of Christianity. When one tribe conquered another, or when two tribes or nations formed a political alliance, there was a strong movement towards fusing their gods. The foreign power, especially if it were dominant, fascinated many of its subject or weaker neighbours. An exchange of deities might be made, out of courtesy. Similarities in ritual were developed, and stress was laid on what was common to the two religions. Now and then the gods were identified, and this was specially easy in the primitive days when certain gods were still nameless powers;[3] men were invited to recognize their own gods under the names of foreign deities or to welcome the latter as allies. The connexion between Israel and Canaan is an illustration in point,[4] and an equally familiar one is the influence of Assyrian rites upon the religion of Israel under kings like Manasseh and Amon,[5] when syncretistic influences were specially powerful in consequence of the political situation. The phenomenon is by no means confined to the history of Israel's religion in the ancient world. For different reasons syncretism, or, as some prefer to term it, 'theocrasy' (*θεοκρασία*),[6] was rife at one period in Greek religion owing to Oriental influences,[7] and as late as the 8th cent. of our era a similar blending took place in Japan.[1] But it is in the history of Judaism, particularly during the two centuries preceding the Christian era, that the elements and issues of syncretism are most clearly marked.[2]

The main impetus to this rise of syncretism came from the political re-adjustment after Alexander the Great. The Seleucid period witnessed a contact between the East and the West, round the Mediterranean basin, which led not only to a fusion of Babylonian with Greek and Roman deities[3] and to a ferment of Oriental religious feeling throughout the Græco-Roman world, but also to movements which, in spite of the vigorous reaction led by the Maccabees[4] and their supporters, affected some circles in Judaism itself. The Hellenizing tendency was fostered by Jewish writers like Eupolemus and Artapanus. It went hand in hand with the allegorizing of Homer and of the OT and with the Stoic philosophy of the Logos. As the tendency to syncretism was innate in Egyptian religion[5]—the spread of the Serapis-cult is only one later instance of it—and as Alexandria formed the centre of activity not only for the amalgamation of Egyptian and Greek or Syrian cults but also for speculative Judaism under the spell of the new ideas of cosmopolitanism, it is not surprising that a step was there taken in the direction of a syncretistic Judaism, which should assimilate and employ current Greek ideas of a cosmopolitan, cosmic character. The exponent of this syncretism is Philo.

'Un syncrétisme dans lequel sont admis tous les éléments, en particulier péripaticiens et platoniciens, qui s' accordent avec l'idée stoïcienne fondamentale de la sympathie des parties du monde, telle serait la définition la plus exacte des vues cosmologiques de Philon.' [6]

Philo's aim was not to blend Judaism with Hellenism. He adhered to his religious inheritance. But he endeavoured to enrich and safeguard it by re-stating it in terms of the current religious philosophies of his day.

As Judaism on the whole resisted this Philonic speculative tendency,[7] so did Christianity in the main resist the later Gnostic movement with its syncretistic impulse during the 2nd and 3rd centuries.[8] Syncretism was partly an evidence of strength and partly an indication of weakness at that period. So far as it meant a readiness to set the new faith in a positive relation to the elements of truth in contemporary cults and mysteries, so far as it breathed a spirit strong enough to assimilate vital data from its new soil and yet preserve its distinctive characteristics, it was healthy. In this respect it carried on the work of the best apologists, linking the Christian tradition to the new situation and proving that the faith was too vital to remain a Semitic cult. But there was another side to syncretism, and to this the Church was keenly, if not always wisely, alert. The fascination of the movement lay in its cosmopolitan appeal—an appeal which was the more seductive that already, within paganism itself, the movement had made headway, as we see from the tone of men like Plutarch, Maximus of Tyre, and Numenius,[9] and from a specific phenomenon like the transformation which had come over a deity such as Isis[10] in the popular pieties of the age. The

[10] Cf. *ib.* vi. 378 *f.*, vii. 434 ff.

passion of the time was for a vague monotheism, which should reflect and answer the unity of the empire. A cosmopolitan syncretism, in the 3rd cent.,[1] began to overlay the earlier national religions and to embrace the Syro-Hellenic and the Western cults in a synthesis which regarded all deities as so many varied expressions of the One, and all rites as more or less acceptable forms of approach to this central, all-pervasive Deity.[2] The individual features of the separate gods and goddesses became less and less distinct. Idiosyncrasies were obliterated, and stress was laid, from the religious as well as from the philosophical and the political points of view, upon the all-embracing unity—generally conceived as a solar pantheism. A man like Macrobius voices this in the 4th century. It underlay the pagan reaction of Julian, which was its last serious challenge to a recalcitrant Christianity. For, although the Church admitted elements which were of semi-polytheistic character, in the worship of the saints, the exploiting of miracles, and even the adoration of the emperor, nevertheless formally the sense of Christianity decided against syncretism of the Gnostic and later of the Neo-Platonic shape.[3] This is the paradox of the situation. Christianity proved by its exclusiveness that it was not, and was not to be, a merely 'syncretistic' faith, in the sense of being eclectic or derivative. At the same time, it not only assimilated bravely and wisely many elements organic to its growth, but also admitted, as we see, *e.g.*, in its later Egyptian popular developments,[4] semi-pagan features which were a handicap ultimately to its successful advance.[5] The syncretistic situation was at once an opportunity and a risk for Christianity. The opportunity was often seized, and the risk was sometimes too much for the faith. Still, the environment did not mould Christianity as it moulded movements like Mithraism and Neo-Platonism. The catholicism of that age suffered from the desire to conciliate the natural man, but it had more in it than an indiscriminate selection or an anxious imitation, such as syncretism usually exhibited.

The tendency of syncretism, when broadly viewed, was to henotheism or pantheism rather than to monotheism. It is true that syncretistic movements meant a break away from polytheism.

'The first corollary of a truly pantheistic religion is not so much toleration of all forms of worship, as a tendency to embrace them all in a single syncretistic system. The one God is the same for all. What, then, does the name they give him matter?'[6]

Such is the theme of a book like the *Saturnalia* of Macrobius, and it is the principle of the religious synthesis underlying Plutarch's philosophy of things. But, as the arguments of a Neo-Platonist like Iamblichus show, this serene indifference was not incompatible with ideas which were henotheistic rather than monotheistic, and the popular cravings proved too much for even a monotheistic principle in Christianity. Pope's opening lines in 'The Universal Prayer'—

'Father of All! in ev'ry Age,
In ev'ry Clime ador'd,
By Saint, by Savage, and by Sage,
Jehovah, Jove, or Lord!'—

echo the syncretistic aspiration in its exalted and abstract form. But syncretism, like Catholicism, appealed to lower as well as higher cravings. The adoration of a Deity like this left the heavens strangely bare for those who had been accustomed to a richer variety of worship, and thus the syncretistic tendency was welcomed as it allowed these heavens to be repeopled by a host of spirits and saints. Syncretism, in practice, almost invariably fostered mythology. Sages and saints, no less than savages, yielded to its spell in this direction. It was found quite compatible, in pagan syncretism, to unite a reverence for the One with some special adoration of one or more favourite, traditional deities.[1] And it is a question how far even the Christian Church of the 4th cent., *e.g.*, which had rejected in earlier days the hospitable syncretism of a monarch like Alexander Severus, tolerated, for the sake of their associations and popular appeal, forms of adoration which were, strictly speaking, out of line with essential monotheism.

LITERATURE.—The literature has been noted during the course of the article; the 'syncretistic controversy' of the 17th cent. is discussed by I. A. Dorner, *Hist. of Protestant Theology*, Eng. tr., Edinburgh, 1871, ii. 177 f.; K. Löffler, *CE* xiv. 383 f.; P. Tschackert, *PRE*[3] xix. 243 ff., and in J. H. Blunt, *Dict. of Sects, Heresies, Ecclesiastical Parties, and Schools of Religious Thought*, London, 1874, p. 585 ff.

JAMES MOFFATT.

SYNDERESIS.—The word *συντήρησις*, which has no classical authority, should mean 'preservation.' In scholastic and mystical theology it appears, often in the corrupt forms *synderesis* or *sinderesis*, in a sense which is hardly justified by the etymology of the word. *Τήρησις* is used in later Greek in the sense of 'observation,' and *συντήρησις* may have been coined on the analogy of *συνείδησις*. The first example is in Jerome:

'Quartamque ponunt quae super haec et extra haec tria est, quam Graeci vocant *συντήρησιν*, quae scintilla conscientiae in Cain quoque pectore, . . . non extinguitur, et qua . . . nos peccare sentimus.'[2]

Bonaventura[3] couples *synteresis* with *intelligentia*, as *intellectus* with *ratio*. Elsewhere he connects *synteresis* with *conscientia*.

'Benignissimus Deus quadruplex contulit ei adiutorium, scilicet duplex naturae et duplex gratiae. Duplicem enim indidit rectitudinem ipsi naturae, videlicet unam ad recte iudicandum, et haec est rectitudo conscientiae, aliam ad recte volendum, et haec est synteresis, cuius est remurmurare contra malum et stimulare ad bonum.'[4]

In the *Itinerarium* he defines *synteresis* as 'apex mentis seu scintilla.' Hermann of Fritzlar speaks of it as a power or faculty in the soul, wherein God works immediately, without means and without intermission. Ruysbroeck defines it as the natural will towards good implanted in us all, though weakened by sin. Giseler uses similar language, saying that the spark (so Eckhart speaks of a *Fünkelein* in the soul which cannot be extinguished) was created with the soul in all men, and is a clear light in them, striving in every way against sin and impelling steadily to virtue, and pressing back towards the source from which it came. In Thomas Aquinas *synteresis* is the highest activity of the moral sense. Gerson says that the cognitive power in man has three faculties—the simple intelligence or natural light, which comes from God Himself; the understanding, which is the frontier between the two worlds; and the sense-consciousness. *Synteresis* is the effective

1 'The expansion of the imperial organisation, the mixture of nationalities in the capital, and the flooding of them by Oriental elements, the heightened intercourse, the prolonged residence of the legions in the provinces and their permeation by foreigners, finally, since the 3rd century, the advent of emperors who were foreigners and unfamiliar with the national spirit of Rome—all these produced the syncretism of religions' (P. Wendland, *Die hellen.-röm. Kultur in ihren Beziehungen zu Judentum und Christentum*[2], Tübingen, 1912, p. 152).

2 See G. Wissowa, *Religion und Kultus der Römer*, Munich, 1902, p. 80 f. 'The reconciled East and West met in Rome to exchange compliments and gods' (J. Martineau, *Essays, Reviews, and Addresses*, London, 1890–91, ii. 315).

3 *ERE* ix. 320.

4 Cf. P. D. Scott-Moncrieff, *Paganism and Christianity in Egypt*, Cambridge, 1913, pp. 126 f., 129 f., 150 f.

6 G. d'Alviella, *Lectures on the Origin and Growth of the Conception of God* (*HL*), London, 1892, p. 232.

1 W. Pater notes this in Marcus Aurelius: 'To his pious recognition of that one orderly spirit, which, according to the doctrine of the Stoics, diffuses itself throughout the world . . . he had added a warm personal devotion towards the whole multitude of the old national gods, and a great many new foreign ones' (*Marius the Epicurean*[3], London, 1892, i. 198).

2 *In Ezech.* i. 1. 3 *Itinerarium mentis ad Deum*, i.

4 *Breviloquium*, ii. 11.

faculty answering to the first of these, and contemplation is its corresponding activity. The word also occurs in Albertus Magnus and Alexander of Hales. Eckhart sometimes seems to identify *synteresis* with the *Fünkelein* or *Ganster*, and with the *intellectus agens* or *die oberste Vernunft*; but the tendency of his philosophy is to make the 'spark' supra-rational and uncreated; he even says: 'Diess Fünkelein, dass ist Gott.' In the earlier writers *synteresis* is usually thought of as a remnant of the sinless state of man before the fall, while in the bolder thought of the school of Eckhart it becomes the seat or organ of divine immanence and of the highest personal inspiration. The notion of an impeccable 'soul-centre' may be traced back to the Neo-Platonists.

SYNDICALISM.—See SOCIALISM.

SYNERGISM.—**1. General meaning of the term and its Scriptural support.** — The term 'synergism' (*συνεργεῖν*, *συνεργός*, 'to co-operate,' 'fellow-worker') became definitely fixed as a *terminus technicus* in theology in the 16th century. It was applied to the later views of Philip Melanchthon and his followers on the question as to the relation between the Holy Spirit (or God's grace) and man's will in regeneration. This view, broadly stated, is that the human will can and does co-operate with the grace of God as a *vera causa regenerationis*. It opposes the position expressed in the sentence 'Homo convertitur nolens.' The human will was, it is true, not regarded as the primary cause (hence synergism differs from Pelagianism or even Semi-Pelagianism); that was unreservedly assigned to God's Spirit and to the preaching of the Word, but the energy of the human will was given a place, and its assent an essential place, in the act of regeneration. The enunciation of this view caused unusual heat among theologians, because its truth or falsehood affected the whole realm of theological truth—the effects of the fall on human nature, the nature and working of God's decrees, the responsibility of the sinner, in fact all Christian anthropology and soteriology.

The term 'synergism' owes its origin to Scripture, but the Scriptural usage of the word operates in a different universe of discourse from the theological. In the NT *συνεργεῖν* (*συνεργός*) is never applied to the psychological relation, whatever that may be, whether creative or co-operative, between God's Spirit and man's will in regeneration or conversion. Its general usage is to describe the objective co-operation of Christian brethren in the furtherance of God's kingdom on earth.

In 1 Co 3[9] (*θεοῦ γάρ ἐσμεν συνεργοί*) the co-operation referred to is that between men in their outward labours for God, not a co-operation between them individually or unitedly with God, however true that may be in itself; and at any rate it refers to post-conversion experience, not to pre- or simul-conversion relationships. In Ph 2[13] the reference is to men already regenerated, and the same is true of Ro 8[28], if *ὁ θεὸς* is the true text—God works in all things for good with those who love God. It does not directly refer to what takes place in conversion, nor does it state the active elements involved therein and their relationships. Again, in Mk 16[20] the co-operation of the ascended Lord with the heralds of the gospel is spoken of in regard to miracles. But the word in Scripture is never used of man's natural faculties or capacities (before conversion) working together with the Spirit of God to effect regeneration, which is the specific and proper theological application of the term. If thus synergism is to be rejected or to be defended from Scripture, it must be by reference to the truth of Scripture, and not to its letter.

2. The origin and development of synergism in Melanchthon's doctrine.—The earlier writings of Melanchthon betray no synergistic tendencies. On the contrary, they are in some respects more rigidly deterministic than even Luther's. The religious man is profoundly conscious of his dependence on God's grace. He does not dream of co-ordinating or equating his own freedom with the grace of God as causal in his salvation. This is true even of those who are legitimately called synergists. 'Arminians usually pray like Calvinists,' said Charles Hodge, adding, what is equally true, that 'Calvinists frequently preach like Arminians';[1] *i.e.*, they appeal to men as responsible voluntary agents. The difficulty arises when one or other of these aspects of experience is made the determining factor in the elaboration of a theological system. Truth is largely a matter of proportion and balance. To begin with, Melanchthon, whose mind was eminently of a systematic cast, worked out his system under the dominating influence of the experience of divine dependence. The Holy Spirit teaches us, he says, that all things happen necessarily by predestination, and therefore there is no such thing as freedom of our will. To maintain free will was to dethrone the grace of God from its unique supremacy. This was his position in the first edition of his *Loci Communes Rerum Theologicarum*,[2] and it was even more rigidly expressed in his Commentary on Romans and Corinthians.[3] Free will he regarded as a scholastic figment emanating from carnal wisdom and obscuring the blessings brought to us by Christ. It made men arbiters of their own salvation and consequently undermined the immediacy of Christian assurance and froze the stream of personal devotion to the Redeemer. Melanchthon resolutely applied this conception of predestination to all events, physical and moral, outward and inward:

'Si ad praedestinationem referas humanam voluntatem nec in externis, nec in internis operibus ulla est libertas.' Since man is born a child of wrath, it follows that he is born without the Spirit of God, and therefore 'nihil nisi carnalia sapit, amat, et quaerit.'[4]

Man has no power over his inward affections, and, though Melanchthon admits that in outward things he has some freedom, even here the power of will seems to vanish. Thus Melanchthon, applying a transcendental conception, predestination, to the facts of human life, as he read them or understood them from Scripture, came to assert that no real causality existed anywhere but in God's will, and so the betrayal of Judas is as truly and as immediately an act of God as the calling of Paul. The reprobation of the damned is as properly and in the same sense the effect of God's will as the salvation of the elect. We are not to think of certain events as determined while others are allowed. All things immediately flow out of God's will necessarily. All questions as to the rightness of God's procedure he silences by regarding these questionings as issuing from man's carnal inquisitiveness.

It follows from this position that man could contribute nothing to his own conversion. He could not repent of himself, and so-called morality (pre-conversion) has no spiritual value.

'Homo per vires naturales nihil [potest] nisi peccare. Carnale est quidquid per naturae vires fit, Socratis constantia, Zenonis moderatio, nihil nisi carnales affectus sunt.'[5]

At this stage we see Melanchthon planted firmly on the experience of God's free grace which gave its strength to the new outlook of the Reformation, combating strongly the popular Roman Catholic view according to which man's free will aided by certain ecclesiastical rites contributed

[1] C. A. Salmond, *Princetoniana*, Edinburgh, 1888, p. 177.

something to man's salvation—a view which cut the vital nerve of personal trust in Christ as the alone Redeemer and opened a door by which the whole mechanism of merits and of an external ecclesiastical authority as ultimate source of redemptive assurance could be reinstated. Melanchthon, however, was extravagant in his elaboration and his application of the truth of man's dependence on God for salvation. He confused in the interests of a theory natural and moral causality, and left no moral bridge between nature and grace. He raised a spiritual feeling—of supreme importance, no doubt—to a position of absolute sovereignty over man and nature and over God Himself. It was impossible that this could be the final resting-place of one like Melanchthon to whom the ethical interest was so important and who was of a mediating spirit.

'Ego mihi conscius sum, non ullam ob causam unquam τε θεολογηκέναι, nisi ut mores meos emendarem.'[1]

Accordingly he was soon convinced, both by the development of his own experience and by the movement of events, of the necessity of defending his position from misconceptions—not now so much from the side of Rome as from pretended followers of free grace itself—and this led him to modify his earlier views. He now came to see that there were many positions previously held by him which he would have to alter. His study of the Greek fathers, whose views on free will were determined by their hostility to Eastern fatalism, and who were very conscious of the moral continuity between nature and grace (often the two were not clearly distinguished by them), influenced his thought, and we find him frequently quoting from Chrysostom: ἕλκει μὲν ὁ θεὸς βουλόμενον δὲ ἕλκει, or from Basil: μόνον θέλησον καὶ θεὸς προαπαντά.[2]

The contentions of Erasmus as against Luther undoubtedly influenced Melanchthon also, and the result was emphasis on the will's own activity in conversion.

His increasing familiarity with the classical moralists and the Stoics, but above all his earnest ethical nature, stimulated into protest by the fanaticism of enthusiasts who regarded regeneration as an immediate unmediated *opus operatum*, led him to alter his views or, as he thought himself, to replace the emphasis. Pre-conversion morality was now given a moral valuation. Men were saying that they could do nothing, and so they defended everything that they did or felt inclined to do, however wicked or outrageous. Roman Catholics were thus given an occasion to equate Lutheranism with immoralism in personal life and anarchy in society, and the doctrines of grace had therefore to be set on an ethical basis for the benefit alike of opponents and of adherents. The result was the advocacy by Melanchthon of what became known in the Lutheran Church as synergistic views. It was in his eyes not a capitulation or a palinode, but an ethical rehabilitation of the doctrine of free grace, although it was viewed by genuine Lutherans as a reversion to Pelagianism.

'One egg is not liker another than his synergy is to the Pelagian,' said Matthias Flacius[3] the Illyrian, a champion of Lutheranism, concerning the views of Melanchthon's follower Victorine Strigel. 'Man, they say, can by the natural powers of his free will equip and prepare himself for the reception of God's grace—exactly the teaching of the godless sophists, Thomas of Aquino, Scotus, and their disciples,' said Nicholas Amsdorf of Johann Pfeffinger and Melanchthon.[4]

Synergism, however, is to be understood not from the extreme censures of its opponents, not even from the extreme statements of its advocates, but rather when we look on it as an ethical protest against positions that threatened to submerge the conscience and heart and to disarm the Church in her fight against licence and anarchy. It is therefore necessary to state Melanchthon's position more fully.

3. Melanchthon's synergism and its effect on his theological outlook.—Melanchthon's interest, we have said, was mainly practical, not theoretic. Accordingly his interest latterly in predestination was that of the custodian of morals. He desired to safeguard God's moral purity from any shadow that might be cast upon it by this dogma and at the same time to free man's moral nature from the paralysing effect of a monergistic determinism. His early statements were extravagant. Now he emphatically declared that God could in no sense be regarded as the author of sin. Evil was permitted by Him, but it was abhorrent to His nature. He therefore felt obliged to give up the dogma of an eternal decree of reprobation. The cause of man's sin was in man himself, and the hardening of his heart was due to wilful disobedience and perversity. Man's own responsibility for his spiritual state was emphasized. The offer of God's grace was universal. Original sin was a fact, yet man's will, though it could not initiate a gracious state, could yet adopt an attitude of welcome or of repugnance to God's grace offered in His Word. Accordingly we find Melanchthon editing the original *Augsburg Confession* in this interest.

Art. 18, which originally read, '*Justitia spiritualis* is effected by the Holy Spirit which is received into the heart through the Word,' he altered to read, '*Justitia spiritualis* is effected in us when we are helped (*adjuvamur*) by the Holy Spirit.' The same alteration, *adjuvari*, is made in art. 20. He prepared the *Leipzig Interim* in the same spirit: 'Although God does not justify men through their merits, nevertheless the merciful God does not act on man as on a block but draws him so that his will co-operates, provided he has come to years of discretion.'

Melanchthon's position is clearly stated in the revised edition of his *Loci* (published in 1533) in a sentence that became famous and stereotyped in after controversy:

'In hoc exemplo videmus conjungi has causas, verbum, Spiritum sanctum et voluntatem non sane otiosam, sed repugnantem infirmitate suae'; or, as he expressed it in later editions: 'hic concurrunt tres causae bonae actionis, verbum Dei, Spiritus sanctus, et humana voluntas assentiens nec repugnans verbo Dei. Posset enim excutere ut excutit Saul sua sponte, sed cum mens audiens, ac se sustenans non repugnat, non indulget diffidentiae, sed adjuvante etiam Spiritu sancto conatur assentiri in hoc certamine voluntas non est otiosa.'[1]

There is little doubt that Melanchthon applies this to the act of conversion, and his view was that the positive assent of the will was essential, although, as Herrlinger[2] points out, he maintained at times that the help of the Holy Spirit was necessary to enable the will to accept the gospel.[3] While he does not make it at all times quite clear whether this assent was itself the result of the working of God's Spirit or due to the natural energy of the will, yet he seems certainly to maintain that something must be granted to the will itself, and here is the point on which the synergistic controversy hinges. This dubiety is noticeable also in some of his followers. One of them, Pezelius, interprets his master as teaching that the will was a *causa subordinata*, after the Holy Spirit in the Word had roused up the soul.[4]

Latterly he defined the will after Erasmus as *facultas applicandi ad se gratiam*, and therefore the difference between the saved and the lost is

[1] *Corp. Reform.* xxi. 658.

[4] See Luthardt, p. 189.

ultimately due not to election—for even God foresaw something in the elect which conditioned His election—nor to reprobation, but to man himself. The difficulty which confronted Melanchthon was just to determine what constitutes responsibility, and, even if his solution is defective and open to verbal criticism, as it certainly is, it is a merit that he recognized the problem in its seriousness and that he tried to solve it on moral grounds.

Melanchthon's synergism also affected his practical outlook. To those who defended civil and social outrage because they were sinners, and would remain sinners unless changed by a divine act which they could do nothing to initiate, he sternly said that man in spite of original sin had liberty in outward actions, the reason could control the will, and the will the bodily movements. No man could say, like the servant of Zeno, that he was compelled to sin by fate. It is clear that his soul loathed this Manichæism, as he called it, and his safeguarding of predestination from those who so understood it was clamantly demanded by the circumstances of the age and of many ages since. It is surely as immediate a datum of Christian experience that the sinner is responsible for his sin as that he ascribes his salvation to God's grace.

Melanchthon did not take a prominent part in the Majoristic controversy, which arose over George Major's statement that 'good works are necessary for holiness,' but by various utterances he indicated that, whilst maintaining the Lutheran position that justification is of grace alone, he was anxious to show that a holy life was the inevitable consequence and the test of the reality of a justified life. Amsdorf's statement that 'good works are harmful to holiness' he characterized as a 'lewd saying' (*unflätige Rede*).[1]

4. The synergistic controversy.—Melanchthon's statements concerning free will were ambiguous and so hesitating that men, accustomed to the breezy statements of Luther on the same subject, felt as if he attributed to the will more than he actually expressed, and his acceptance of Erasmus's formula gave this feeling a colour of truth. Luther on this point was definite:

'In geistlichen und göttlichen Sachen was der Seelen Heil betrifft da ist der Mensch wie die Salzsäule, wie Loth's Weib, ja wie ein Klotz und Stein, wie ein todt Bild, das weder Augen noch Mund weder Sinn noch Herz brauchet.'[2]

What Luther advocated with zeal Melanchthon admitted with reserve. Controversy was therefore inevitable, and it broke out violently, occasioned by two disputations of Pfeffinger,[3] a Leipzig professor and disciple of Melanchthon.

He tried to answer the question why one man under the preaching of the Word became converted and another did not, and the decisive factor, he maintained, was that one willingly assented and the other did not. The difference cannot be attributed to a difference in the activity of the divine will: therefore the difference lies in man himself. We must therefore attribute a certain synergy to our will. Man even now in his fallen state is not as a statue or a stone, nor is he purely passive, for, if that were the case, there would be no difference between the pious and the impious, the elect and the damned, Saul and David. God would become a respecter of persons and the author of contumacy in the impious and the damned. On the other hand, the human will has not the power to effect spiritual motions without the help of the Holy Spirit, but the Holy Spirit moving through the Word of God, and the mind thinking, and the will not resisting but complying under the Spirit's influence—these are the causes which concurrently produce conversion.

Pfeffinger's defence and explanation of Melanchthon's views called forth violent opposition especially from Amsdorf and Flacius. The former (see above) said that, according to Pfeffinger, man could prepare and equip himself for conversion by the natural powers of his free will without the aid of the Holy Spirit. Verbally this was very unjust, but essentially it had an element of truth in it. Flacius appealed to Luther's words and declared that man was worse than a stock or stone because he offered resistance to God's Spirit. The will therefore does not co-operate; it opposes and resists. Every one knows that this criticism, though infelicitously expressed, is in touch with reality and spoken out of personal experience. As regards regeneration, man is absolutely passive—he is spiritually dead; the image of God is not only wholly obliterated, but is transformed into the image of Satan. Man thus contributes nothing positive to his own conversion; any contribution of his is negative and resisting.

Pfeffinger replied to Amsdorf and incidentally mentioned Flacius. He declared himself more explicitly as holding that the unconverted will had the power of either obeying or resisting God's offer in His Word. Thus the controversy raged, the new university of Jena contending for the old position of Luther and violently opposing the synergistic movement, which was stoutly advocated by the faculties of Leipzig and Wittenberg. At last, at the instigation of Flacius, an attempt was made to silence opposition by authority. John Frederick II., Elector of Saxony, was appealed to, and by his command a *Book of Confutation and Condemnation* of all prevalent heresies was published at Jena in 1559. Of its nine divisions the sixth was devoted to the refutation of synergism. Those who taught that man had power in his will to co-operate with the grace of God in conversion were stigmatized as overthrowers of the grace of God. It was false to maintain that man can do anything by his free will in accepting or rejecting grace. Human nature is wholly adverse from God and hostile to God and is subjected to the tyranny of sin and Satan.

In a similar strain the orthodox Lutherans—Amsdorf, Wigand, Tilman Hesshusen, etc.—spoke and wrote against synergism and deduced this anthropology from their predestinarian views, the last-named saying that, in one respect,

'God did not wish that all men should be saved, for He did not elect all. God's will acts in one uniform way on men just as on stocks and stones.'[1]

Melanchthon raised his voice against this deterministic delirium and declared that it is absurd to talk of conversion until the will consents, that to reject God's grace is an act of will and not an act of God, and that human nature had at least power in outward actions. An attempt was made to make the book binding on teachers and preachers, but without success. Even in Jena, the citadel of orthodoxy, Pastor Hugel refused to read the document from the pulpit, and Strigel raised his voice on the synergistic side. Both Strigel and Hugel were imprisoned, and it looked as if synergism were doomed in Jena, for the university was strengthened in the orthodox interest by the appointments of Wigand and Judex to professorial chairs and by the recall of Musæus, all of whom were strong champions of orthodoxy. However, the prisoners were set free after an imprisonment of less than six months, and a further attempt was made to settle the dispute by public discussion. This disputation lasted from 2nd until 8th Aug. 1560, and occupied thirteen sittings. The interest for us centres in the positions defended and refuted regarding free will and God's grace.

To begin with, Strigel maintained that the substance and qualities of human nature were not obliterated by the fall nor altered, but only hindered in their activity. His position he made clear by a curious physical illustration.

A magnet, he said, cannot attract iron when smeared with onion-juice, yet it retains its magnetic properties, and it can attract though smeared with goat's blood. It is the same magnet in both cases, but its activity is hindered in the one

case and not in the other. So by the fall man's nature is not destroyed, but only weakened. He is like him who fell among thieves between Jerusalem and Jericho, half-dead, or like one weakened by disease but not dead like a corpse.

Strigel is here aiming at a distinction which satisfies many theologians—that between formal freedom and material freedom or that between natural ability and moral ability, a distinction largely used by Jonathan Edwards but in currency before his day.[1] According to this distinction, man does what he pleases and wills what he pleases. That is the very meaning of will—it is not compelled from without; but, though man has this natural ability, as a matter of fact he does not will the good spiritually simply because he does not want to—he lacks moral ability.

Seeberg contends that Strigel was groping after this distinction, but did not adequately express it.[2] That is certainly true of him at this Weimar disputation. He did not make his meaning clear, but afterwards he distinguished very clearly between *efficacia* (δύναμις) or *facultas*, on the one hand, and *capacitas* or *aptitudo*, on the other. Man has lost the first through the fall, and the Holy Spirit restores to the will the δύναμις or efficacy or faculty of believing, which was lost by the fall. At this disputation, however, Strigel did not go so far as that. When asked by Flacius if the human will co-operated with the Holy Spirit before conversion or only after, he hesitated and said that to him conversion was not a point but a line, not the beginning of the Christian life but the whole of it.

It is evident from reading the disputation that Strigel really wished to attribute power to the will, but at the same time to ascribe the chief place to the Holy Spirit—so that synergism is an unfortunate term to use of factors that cannot be equated. He repeated the Melanchthonian formula: 'Concurrunt in conversione haec tria: Spiritus sanctus movens corda, vox Dei, voluntas hominis quae voci divinae assentitur,' a sentence which is ambiguous; and on this point no decision could be reached. On the other hand, Flacius went so far as to say that the very substance of the soul was altered by the fall and by sin, and that therefore man was purely passive, or active only in hostility to God. Peace could not be restored by public controversy. In a few months the party of the Illyrian was driven from the country, and Flacius, a man of undoubted erudition, died in his fifty-fifth year at Frankfort-on-Main. Strigel also left and died in Heidelberg at the early age of forty-five.

5. The Formula of Concord.—After various unsuccessful attempts at a solution of this and other disputes the *Formula of Concord*[3] appeared, and, as it became an authoritative standard of the Lutheran Church, its position on this topic must be stated here.

The problem is dealt with in artt. 1 and 2 of the *Formula*, and, while no personal names are mentioned, the views of contending parties are very clearly kept in mind. In the 1st art., dealing with original sin, a clear distinction is drawn between actual transgressions (*actualia delicta*) and the hereditary sickness of the soul. Man's nature is in all its parts poisoned by inherited sin, and for this condition man is guilty and condemned by God's law, so that by nature men are the children of wrath, and from this state they can be saved only by the benefits of Christ's merit. How this corruption is transmitted is described. God creates every soul afresh, but because of physical generation from corrupted seed the hereditary disease of sin is propagated. Yet God is not the author of sin in either its origin or its development, nor is man's substance converted into sin. Original sin is not to be identified with the essence of man. A clear distinction must be made between our nature (which was created, and which is daily preserved, by God), in which original sin dwells, and that original sin itself which dwells in our nature. To teach otherwise is Manichæism, not Christianity. This is further corroborated by the fact that the Son of God, according to His human nature, is consubstantial with us, His brethren. He took our nature, but it was sinless in Him. Further, God in sanctifying men purifies them from sin, accepting them for Christ's sake. He gives them grace, but He has eternal hostility towards sin itself. Moreover, if original sin were the substance of the soul, the doctrine of the resurrection of believers would be null and void. Thus the *Formula* disposes of the Flacian error. Yet, while all this is so, man before God in his actual fallen state is truly and spiritually dead in all his faculties, as far as spiritual good is concerned. Strigel's illustration of the magnet will not do. Man is not simply surrounded by outward hindrances; he cannot do anything, however small, in his natural state in regard to spiritual things. He has not the capacity 'in rebus spiritualibus aliquid inchoandi, operandi aut cooperandi.'

In the 2nd art., in which we have an attempt at an analytical solution, the relation of man's powers to the Holy Spirit is set forth. In fallen man before conversion there does not remain the smallest spark ('ne scintillula quidem') of spiritual power by which he can prepare himself for apprehending God's grace, or for applying or accommodating it to himself. Rather he resists it. Man is capable certainly of being converted. He is still a reasonable creature, but as regards any real initiative 'hac in parte deterior est trunco, quia voluntati divinae rebellis est et inimicus.' He has a capacity for conversion, but a passive one, and his conversion is purely a work of the Holy Spirit. At the same time it is stated that man by natural reason and will has somehow power to live a decent outward life. Thus the *Formula of Concord*, while strongly opposing the strange view of Flacius as regards the substance of the soul of fallen man, at the same time as strongly opposes the view which would give any power to the will in initiating conversion. Of Melanchthon's three causes it makes the Holy Spirit alone the efficient cause, the will and nature of man being only a subject to be converted, while the Word of God preached or read is the means through which the Spirit works. Great stress is laid on the Word of God as the means of the Spirit's working. Thus God softens men's hearts, draws them, and reveals to them their sin; and, realizing His anger, they feel in their heart contrition which makes them attend to the promises of the gospel, and so faith ('scintillula fidei') is quickened in their soul and 'hoc modo Spiritus Sanctus qui haec omnia operatur in cor mittitur.'

Thus the *Formula of Concord* unhesitatingly rejects synergism. In conversion the real agent is the Holy Ghost, the assent of the will is not a cause, but is itself an effect of the Spirit's working through the Word. Co-operation may be spoken of after conversion, but even then we must not think of God's Spirit and man's will as if they were like horses drawing a load and working side by side. God's Spirit in the converted man works on and through the will.

6. The Reformed position as regards synergism.—The problem of the relation of man's nature to the grace of God was agitated in the Lutheran Church after the *Formula of Concord* and has been a subject of dispute down to the present day.

[1] It is used by Twisse, Howe, and very clearly by Isaac Watts, the famous hymn-writer.
[2] *Lehrbuch der Dogmengesch.*, Leipzig, 1895–98, ii. 356.
[3] See *ERE* iii. 849.

In the Reformed Church the same problem arose, though it was approached somewhat differently. The distinctive feature of the Calvinistic system is its logical consistency; every doctrine is discussed not only by itself but in the light of the whole. The supreme regulative principle in Calvinism is the sovereignty of God; and, when man's regeneration was viewed in the light of this principle, it was recognized that God's grace acted differently on men who are regenerated and on those who are not. That is obvious, but whence the difference? It was due to the determination of God. God, who had elected some, did so not as a bare matter of decree or quiescent foreknowledge or fortuitously waiting on their faith, but energetically through a series of efficient means—the redemptive mission of His Son, the preaching of the Word, the irresistible working of the Holy Spirit; and these were effective all along the line in the case of the elect, leading them from spiritual death to grace and glory. Now, in the case of the unregenerated it was a sufficient proof that this divine redemptive causality had no place, that it failed in this link of regeneration. It was nonexistent here; therefore it was wholly nonexistent. God did not elect them; the redemption of His Son was not purposively undertaken or efficaciously operative in their case. Thus the question of the will is so embedded in the logical coherence of the system that to moot it is to raise the question of the validity of the system as a whole, and that is what happened in the case of Arminius, and especially—for Arminius himself did not attribute regenerating power to the will—in the case of his followers Simon Bischop (Episcopius), Philippus van Limborch, and others. The objections to Calvinism, as far as the subject of this article is concerned, were directed mainly against what was called irresistible grace and the extent of the Atonement.

The Arminians—for we may leave the Socinians out of account; W. Robertson Smith has aptly described them as 'Pelagians of the intellect'—held that grace worked similarly on all, the difference from which conversion arose being due not to God's grace but to man's own will. To them irresistible grace (or, more properly, efficacious grace) meant necessity, and so the responsibility for the final damnation of the lost fell on God. Again, they maintained that by the Atonement the possibility of salvation was opened to all, and they vehemently rejected the doctrine of the eternal reprobation of some, as Wesley so strenuously did afterwards. The Synod of Dort attempted to settle the problem, but in the Reformed Church as in the Lutheran it keeps constantly emerging. Here even more than in the Lutheran Church, which diffidently refrained from applying predestination theories to its anthropological and eschatological views,[1] the problem is an acute one, for the question of God's moral character is raised, and it is from this quarter, rather than from the sphere of religious psychology, that the opposition emerges, and here its strength lies. Hence we find that Calvinistic apologetic has largely been a defence against what is regarded as misunderstandings, perversions, and unwarrantable inferences.

In regard to efficacious grace the Calvinist did not mean that God's grace did violence to the human will by outward or inward compulsion, or that it altered the nature of the will as such, which always has worked and does work voluntarily, but that grace affected the disposition of man in such a way that the resistance of the will was changed into obedience. It was not the obedience of the will that made grace efficacious, but much more the efficacy of grace that made the will not only in act but in disposition obedient.

[1] Cf. also the Thirty-nine Articles of the Anglican Church.

Some Calvinists, notably the school of Samur, agreed with the Arminians that the Atonement was intended for all mankind; but the Arminians contended further that it is left to the free will of man either to concur with or to reject this intention. The Calvinists felt that, while this opened a possibility of salvation to all, it made salvation certain for none; the Atonement thus became itself a contingency rather than a reality, and they could not understand a purpose of God which could thus be frustrated. To leave the future of mankind hanging on the slender thread of the free will—even if that thread was not itself an illusion—seemed too precarious to be consistent with a purposive God, and rendered the salvation of the regenerate itself problematic, a denial of the perseverance of the saints. Hence the position that the Atonement was meant for those that are saved or to be saved, and that grace is efficacious in the case of the elect; and so the empirical fact that some are not saved is itself a proof that in God's secret purpose the Atonement was not meant for them.

Here also, as in the Lutheran Church, and as in the internal disputes on this question between the Jesuits and the Jansenists in the Church of Rome, as well as in the disputes between Rome and Reformers on this point, we see the question at issue in spite of many cross currents in the discussion itself. The Calvinistic and Arminian problem is even more illuminating than the Lutheran because it is more conscious of the pervasive nature of the issue. It is a matter not of anthropology simply, but of theology in all its bearings. A survey of the discussion, in spite of the changed outlook of our own day, reveals the palpable dangers on either side and at least teaches us where we are not to search for an adequate solution.

The problem is not an accident of history, but a fundamental problem of thought, perhaps the problem which goes deepest of all—the relation between God and man. It goes deeper and higher than the question of man's place in nature or man's place in history; it is the question of man's place in relation to God.

7. Conclusion.—What, then, is the significance of the synergistic controversy for modern Christianity? It is evident that many of the preconceptions accepted by both parties alike, whether we look at the discussion as handled by Augustine and Pelagius, by Flacius and Melanchthon, by Calvin and Arminius, or by Jansenist and Jesuit, are antiquated. The march of natural science has raised afresh the whole question of the nature of man, and the problem is now whether man's nature can be explained from below as a development of life in general. Alongside of the activity of science has gone a prodigious wealth of philosophical speculation dealing with the nature of man, his place in the universe, and the value of his experience and his ideals. The profound changes also in the structure of society, the emergence of democratic ideas, and the consequent application of new categories in the explanation of the significance of human life have changed the outlook considerably. The more direct activities of Christianity itself, its vast missionary ideals and efforts, the investigations into the psychology of the Christian life, the insight into what is permanent in Christian experience as distinct from what is accidental or subsidiary—in short, the main currents of modern thought and life—have poured through Christian theology till the old landmarks are submerged, and history and reflexion alone make us certain that the unity of experience is a reality and that the problems of the spirit change not.

however much the outlook may change. It is on this changed background and in the light of these tendencies that the problem of synergism can alone be approached.

(*a*) Modern Christianity in all its schools has had to fight against a naturalistic conception of man. From this point of view we can appreciate the emphasis laid by the early Greek theologians on man's freedom. Whatever may be thought of their view of freedom, the important point is that as against fatalism Christianity asserts that freedom has a real meaning as applied to man. So all Christian schools to-day, whether they be historically affiliated with Augustine or Pelagius, emphasize freedom as against physical necessity or direct determinism. Freedom has a meaning in regard to man that it has not in regard to matter. It is necessary to be clear on this point because naturalistic necessitarians too often claim the Augustinian and the Calvinist as on their side, whereas they are working on a different level of experience altogether. This is brought out clearly by the following considerations.

(1) According to Calvinism and Arminianism alike, man was originally created in the image of God, and his final end is 'to glorify God and to enjoy Him for ever.' This is deeper than any change brought about by sin and subsists as an inalienable characteristic of human nature.

'A lady once said to me, "The more I see of myself, I see nothing so properly mine as my sin." I said to her, "Well, you do not see deep enough. There is something far more properly yours than your sin; and your sin is improperly yours. It is a blot in your being, which, if you do not get quit of it, will never cease to be *unnatural* to you. No; the image of God is more properly yours, though you had no share in the production of it."'[1]

(2) It has always been held that man is responsible for his sin. He has formal freedom, nor can he ever become a non-moral being in the sense that he can become non-voluntary in his actions or place himself beyond the claims of the moral law on his character. Whatever his actual condition due to sin, these things hold true. His reason, conscience, and will always act rationally, morally, and volitionally. Again, the question here is not whether we agree with the content of this nature as explained by different schools of Christian thought. We may consider that the Arminian view gives too much, and the Calvinistic view too little, real freedom; but the important point is that from the general Christian standpoint man is not explicable in terms of mechanism, however subtle or refined in form. The synergistic controversy has no meaning either for opponent or for defender if the naturalistic view of man is true. The theory of T. H. Green[2] as to the relation of the character to volitions is simply Calvinistic psychology in a philosophical dress, but its whole motive is to overthrow the naturalistic conception of man.

(*b*) Synergism becomes a real problem when man's freedom is viewed in the light of God's activity. We are so accustomed to defending liberty against material necessity in our age that we are apt to forget that the real problem of freedom emerges on the religious plane. What meaning and content are we to give to man's freedom, not now as against nature, but as against God Himself? Two main streams of thought emerge in history on this question.

(1) The Pelagian, looking almost exclusively at man's free power of initiative, became jealous even of God's interference. Man on this view is a bare individual and largely, if not wholly, his own creator. His sin is a bare act of will, undetermined by what went before and unaffected by what comes after. His will is his unconditionally, for the character is the result of acts of will; but an act of will can alter it easily. His merit is his own, and his salvation is his own. God never gets inside the adytum of man's free spirit, and free will is primarily the power of choosing between alternatives.

(2) To the Augustinian the problem was far more complicated. He recognized that man was organically related to the past. The influences of the past affect his will and disposition and character. He does not begin as a moral neutral or moral unit. Sin is more than a bare act of will. When a man becomes self-conscious, it is there not simply as the result of a wrong choice, but as the fruit of a vitiated disposition and itself a source of vitiation. The characteristic of moral awakening is the discovery of our bondage. We become conscious of our need of freedom more than of the fact that we are free. The interposition of God is not regarded as a violation of freedom, but welcomed as the restorer and succourer of true freedom itself, which to the Augustinian meant acting in accordance with the highest. This deeper view of man led Augustine to the certainty of pre-individual iniquity—racial evil—as it led Kant to posit a supra-temporal fall. Objections may be raised to phrases like original sin, the guilt of Adam's transgression, the fall of Adam, supra-temporal fall, and it is right to aim at verbal accuracy if possible, but it is essential that the repudiation of inadequate phraseology should not be accompanied by the rejection of the realities bodied forth by inaccurate phrases.

We have the same tendencies in philosophy in our day represented by pluralism in its many forms and by absolute idealism. The former is so alive to the importance of the individual that in its extreme and logical forms it makes the individual eternal *a parte ante*, and, if God is recognized, it is as a *primus inter pares*; the latter is so conscious of the claims of God that it tends to annihilate the personal life of the individual *a parte post*. The problem as to how a man can act against God's will is insoluble intellectually, and the Calvinist has great difficulty, in spite of his insistence on man's accountability and God's holiness, in saving himself from the pitfall of pantheism where sin is factorized into something different from what it is to the conscience. Yet, however sinful man's state may be, however the sinner may be alive to the deep-seated nature and wide extent of this disease, he accepts responsibility for it as his. He cannot devolve the responsibility on Adam or on circumstances. That is the moral attitude. The intellect may attempt to explain sin either scientifically as a residuum from our animal origin or philosophically as due to finitude or as a necessary stage in our development; but every explanation that explains away the moral attitude is itself unsatisfactory. Pantheism, material, philosophical, or theological, suffers shipwreck on the conscience. But, on the other hand, though we are compelled to recognize centres of activity acting contrary to God's will, it is impossible to give them the self-subsistence that we give to God. Even in sinning they depend on Him and are within the scope of His control. The Christian doctrine of creation—creation in time, for creation has no other meaning in regard to dependent beings — saves from pantheism and pluralism alike. While all subsist in God, personalities have a limited power of self-antagonism to God, but they do not compel God to disown His character as Source and responsible sustainer of all. He creates personalities with the capacity to create themselves. Their endowments and faculties, which vary so much as regards both individuals

[1] John Duncan, *Colloquia Peripatetica*[3], Edinburgh, 1871, p. 124.

[2] *Prolegomena to Ethics*, Oxford, 1883.

and races, which are also so clearly dependent on their historical setting, are of God. It is this inalienable immanence of God that accounts for the presence of high ideals among men however sinful, for the unrest and lack of harmony in the life of man of which Pascal speaks so eloquently, and it is this that makes salvation possible and essential. The Augustinian tended to view man's original constitutive nature as made in God's image as an affix of an ideal human ancestor, and to leave man as he now is nothing but his sinful organic relations. A logical distinction was made an absolute distinction *in rerum natura*. The divine image in man was practically regarded as a *fulgor* appearing once in Adam for a brief space, but now no more; but sin has meaning only when the inalienable immanence of God in man is fully recognized. The Church has never agreed to the Flacian view of human nature as itself sin; but its language has often been perilously near it, and, when it has, protests have been raised, as in New England, where the amiable qualities of man have been emphasized until the need of salvation has been minimized or evaporated. On the ground, then, of man's original creation, we understand that man has freedom which, alas, has been exercised against God Himself, though given by God and intended by Him to coincide joyfully with His own.

How to reconcile God's holy omnipotence and foreknowledge with this human fact seems an insoluble problem. We must give content to God's predestinating activity; it is not enough to posit a quiescent, non-interfering divine knowledge; otherwise there is no guarantee of the ultimate success of God's purposes. But, on the other hand, we must not look on God's absolute decrees as the moral cause of sin or as acting mechanically in man, and certainly not as an insurmountable barrier to the recovery of his true freedom, and that in a moral way.

The synergist fought against a view of God which made Him in the case of some men the obstacle to salvation, withholding His grace from some, and making remedial provision only for some; and in this the synergist was right. Here again the Christian doctrine of the new creation is the safeguard. God is not only inalienably immanent in man by virtue of the first creation; He is also redemptively active in man through Christ. The Calvinist is mainly right in his psychology of conversion.

God's grace is efficiently active, and the consent of the will is the result of that activity; yet He is active in harmony with man's true being, and man's consent is voluntary. Man does not simply accept the offer of grace by the power of his unaided will and so convey it into the soul. His will is never unaided; grace comes into the soul as a power of God moulding the will itself. The acceptance itself is not the cause of its presence. The supremacy of grace and its efficiency is maintained by the religious consciousness on self-examination, but the acceptance itself is an act of will.

The miracle here also is not that a man's will should be effectually motived to harmonize with God's redemptive activity; the miracle is that some men should resist even this. It is not to be thought that their resistance is due to the fact that God withholds or withdraws His gracious activity or that He uses it only gingerly. The gospel offer is to all, even the Calvinist says, and it is a *bona fide* offer; it is more, for the cost to God—what we mean by the Atonement—is so real and so great that the activity of God is an energy penetrating into man. God does not deal with the sinner simply in the way of punishing him; He deals with him in a redemptive way. How can this fact of man's resistance, again, be reconciled with God's omnipotence in grace? Many, like Schleiermacher, find refuge in final universal salvation, in a probation extending beyond this life. But God's omnipotence is a reality which recognizes now man's power of resistance because it values man's freedom. This resistance does not annihilate the divine omnipotence, nor does it rob God of His character as Creator and Redeemer, were the resistance to be eternal.

The value of synergism is in its denials. It is wrong to regard God's activity as doing violence to this initiative of man. The weakness of synergism is that it tends to regard this activity of man as separate from God to begin with and as only co-operating with God. The relation between them is more intimate. God Himself is present from the outset in this freedom; and when, as in Christian experience, the soul awakens to the presence of God, then it is felt that God has done so much in Christ, and is doing so much, that it is joyfully acknowledged that the will's power is His, and the renewal of it is His work. Salvation is not an acquisition of the will so much as the welcome deliverance and liberation of the whole personality. Religion in its strength emphasizes God, and in so doing frees man into the liberty of joyful service.

LITERATURE.—The lives of the reformers, and the general treatises on the history of the Reformation, all deal with the synergistic controversy. J. W. Richard, *Philipp Melancthon: The Protestant Preceptor of Germany, 1497–1560*, New York, 1898, gives a good account of Melanchthon in English; cf. Karl Schmidt, *Philipp Melancthon*, Elberfeld, 1861.

C. E. Luthardt, *Die Lehre vom freien Willen*, Leipzig, 1863, gives a detailed history of the controversy in its origin and development; also *Die Arbeiten Melancthons im Gebiete der Moral*, Leipzig, 1884; Flotow, *De synergismo Melancthonis*, Vratislaw, 1867, is a special handling of the subject referred to by G. Kawerau, who has written much on the various antagonists in the synergistic controversy; see Schaff-Herzog, xi. 223 ff., also *PRE*[3] xix. 229 ff.; E. F. Fischer has a treatise on Melanchthon's teaching on conversion (*Melanchthons Lehre von der Bekehrung*), Tübingen, 1905; and Paul Tschackert, *Die Entstehung der lutherischen und der reformierten Kirchenlehre*, Göttingen, 1910, pp. 520–531, is an excellent summary.

The literature on the *Formula of Concord* is relevant to the discussion; cf. F. H. R. Frank, *Theologie der Konkordienformel*, vol. i., Erlangen, 1858; R. Rothe, *Dogmatik*, Heidelberg, 1870, p. 171 ff.; F. Loofs, *Leitfaden zum Studium der Dogmengeschichte*[4], Halle, 1906. R. Seeberg, *Lehrbuch der Dogmengeschichte*, Leipzig, 1895–98, as well as other treatises on dogmatics, give relevant sections. See also H. Heppe, *Gesch. des deutschen Protestantismus*, 4 vols., Marburg, 1853–56; I. A. Dorner, *System of Christian Doctrine*, Eng. tr., Edinburgh, 1880–82, iv. 164 ff. For Reformed doctrine see literature under art. CALVINISM, and for the modern problem H. Wheeler Robinson, *The Christian Doctrine of Man*[2], Edinburgh, 1913. See also artt. CONVERSION, FREE WILL, GRACE.

D. MACKENZIE.

SYNODS.—See COUNCILS AND SYNODS.

SYRIANS (or Aramæans).—1. General introduction.—The Hebrew 'Aram' is rendered in the LXX by Συρία, 'Syria.' We may therefore take it for granted that originally the words 'Aramæans' and 'Syrians' were synonymous. At a later time 'Syrian' and 'Assyrian' were used indiscriminately: Ἀσσύριος = Σύριος = Σύρος.[1] According to Gn 10[22], Aram was one of the five sons of Shem, and, according to Gn 10[23], Aram was the father of Uz, Hul, Gether, and Mash. The Aramæans, or Syrians, are therefore Semites.

A complete study of the Aramæans would include that of all the races whose languages, manners, and religions come within the Syrian scope. But our purpose here is to consider only the pagan Aramæans. We shall not touch upon Western (*i.e.* Biblical) Aramæan, represented by several quotations preserved in the OT and the NT, nor the Egyptian papyri and ostraka, particularly those of Elephantine, nor the Jewish dialects

[1] Cf. T. Nöldeke, in *Hermes*, v. [1870] 443 ff.

represented by the Targums, the Megilloths, and the Jerusalem Talmud, nor Samaritan, nor the fragments of Christo-Palestinian literature. All those are of the greatest importance from the general Aramæan point of view, religious as well as philological, but are outside the scope of this article. The same remark applies to the different branches of Eastern Aramæan, which includes the Babylonian Talmud, the literature, language, and religion of the Manichæans, Mandæans, and Harranians (*qq.v.*). We shall also leave untouched the study of Syriac (language and literature) and the chief Neo-Aramæan (Christian) dialects.

The best known of the pagan Aramæans are the Palmyrenes (*q.v.*), the Nabatæans (*q.v.*), and the Syrians of Damascus and of the region north of Syria. We get our information on these races from the OT, ancient inscriptions, and Latin and Greek coins and documents.[1]

The ethnic *aramî*, אֲרַמִּי, 'Aramæan,' is found in 2 K 5^{20}, Gn 25^{20}, Dt 26^{5}. Its fem. is *aramîṯa*, אֲרַמִּיָּה in 1 Ch 7^{14}. The plur. is *aramîm*, אֲרַמִּים in 2 K $8^{28f.}$ 9^{15}. The corresponding Greek of the LXX is respectively *βαθουὴλ τοῦ Σύρου ἐκ τῆς Μεσοποταμίας, ἀδελφὴν Λαβὰν τοῦ Σύρου* (Gn 25^{20}), etc.; *ἡ Σύρα* (1 Ch 7^{14}); *οἱ Σύροι* (2 K 8^{28}).

The adverb אֲרָמִית, *aramî*, 'in Aramæan,' is translated by the LXX *Συριστί* in Is 36^{11}, 2 K 18^{26}, Dn 2^{4}, 2 Es 4^{7}.

The OT gives the following information on the pagan Aramæans.

Aram Ṣoba (*Zobaḥ*), אֲרָם צוֹבָה (LXX *τὴν Συρίαν Σουβά*), in 1 S 14^{47}, 2 S 8^{3} etc., $10^{6.8}$, 1 K 11^{23} etc.. This expression means an Aramæan state in the north of Canaan or its capital. The town of Zobah was situated in Lebanon, according to 1 Ch 18^{3}.

Aram Ma'aka (*Maachaḥ*), אֲרָם מַעֲכָה (LXX *ἐκ Συριᾶς Μααχά*), in 1 Ch 19^{6}, means a territory at the foot of Mount Hermon (Jos 13^{13}). The name of the people is Ma'akati (Maachathites), מַעֲכָתִי; according to Dt 3^{14}, the Ma'akati dwelt beyond the kingdom of Og; they were not included in the conquest of the descendants of Manasseh (cf. Jos 12^{5} 13^{11}, 2 S 23^{34}).

Aram beth Reḥob (*Beth Reḥob*), אֲרָם בֵּית רְחוֹב (LXX Ῥοώβ), in 2 S 10^{6-8}, was a small Aramæan or Syrian kingdom which supplied mercenaries to the sons of Ammon when fighting against Joab, King David's general. They took to flight before Joab, who re-entered Jerusalem in triumph. Reḥob is said to be in the north of Palestine, in the region of Laish, or Dan (Jg 18^{28}).[2]

Aram Naharaim (*Naḥor*), אֲרָם נַהֲרַיִם (LXX *εἰς τὴν Μεσοποταμίαν*), is identified by the LXX with Mesopotamia (Gn 24^{10}, Dt 23^{5}, Jg 3^{8}, 1 Ch 19^{6}), 'Syria of the two rivers.' This is a mistake. Naharaim means 'country of the river,' and corresponds to the Nârima of the Tel el-Amarna letters and to Nahrina in the Egyptian inscriptions; it extended along the two banks of the middle Euphrates.[3] At the time of the Khati the name Naharanna was given to the country lying between the Balikh and the Orontes.[4]

Paddan Aram (*Padan-aram*), פַּדַּן אֲרָם (LXX *ἐκ τῆς Μεσοποταμίας Συρίας*), in Gn 25^{20} $28^{2.5-7}$ 31^{18} 33^{18} 39^{9} etc. This term, 'field of Aram (?),' perhaps refers to northern Mesopotamia.[5]

2. Damascus.—*Aram Dammeśeq*, אֲרָם דַּמֶּשֶׂק (LXX *Συρία Δαμασκοῦ*), in 2 S $8^{5t.}$, 1 Ch $18^{5t.}$, is Syria of Damascus, which came to the help of Hadadezer, king of Zobah; David slew 22,000 Syrians and put garrisons in Syria of Damascus (Syria-Damascus).

In the course of time Syria (Aram) comprised numerous divisions, the chief of which, besides those mentioned above from the Bible, were: Batania, or country of Bashan, Commagene with its capital Samosata, Cyrrhestice with Cyrrhus as capital, Chalybonitis with its capital Chalybon (Halep=Alep), Coele-Syria with Heliopolis (Baalbek) as capital, Seleucide, or Tetrapolis, with Seleucia, Antioch, Laodicea, and Apamea as principal towns, Chalcidice with its capital Chalcis (Kinnesrin), etc. In many cases we have not enough information about these divisions to treat them separately. The best plan will be to give a résumé of the details supplied by history, inscriptions, and other documents, grouping them round Damascus and the Damascene.

The god who received most worship was Hadad, whose consort was 'the Syrian goddess,' or Atargatis. This god was also called Ramân or Rammân. These two names appear as early as 3000 B.C. in the cuneiforms. This deity does not appear in Phœnician texts. Hadad is represented in the same way in Syria and Mesopotamia. He is the god of lightning and thunder; he shakes the mountains; he is beneficent when he sends the rain which fructifies the earth; he is the destroyer when he sends floods and inundations. According to the inscriptions of Senjirli, Hadad was the first of the gods of northern Syria in the 8th cent. B.C. His chief sanctuary was at Hierapolis (Mabbog, Manbij), near the Euphrates. He was specially worshipped by the agricultural populations of Syria as the protector-god of the harvests. In time his cult became confused with that of the sun; his head was then ornamented with rays; this identification is particularly noticeable in Heliopolis (Baalbek), where the cult of Hadad and that of the sun are one and the same. In Roman times Hadad became Jupiter Optimus Maximus; he received various local denominations (Dolichenus, Hadaranes, Heliopolitanus), but he can always be recognized by the fact that he is represented with the bull or that he is mentioned along with his consort, the Syrian goddess Atargatis. A third personage is usually connected with these great gods, regarded as their son or their daughter. These three together form the triad known as the *dii syri*. They have sanctuaries in a great many Syrian towns—Rhosus, Raphaneæ on the Lebanon (in Græco-Roman times). But the principal sanctuary of the Syrian gods, after Hierapolis, was Damascus, and the Bible mentions kings of Syria in the 9th cent. B.C. with theophorous names, such as Ben-Hadad, Tabrimmôn. It is even possible that this cult of Hadad exercised a certain influence on some Israelite centres, which would explain the representation of Jahweh by a young bull. In Roman times Hadad became Jupiter Damascenus. In all probability Jupiter Heliopolitanus, the god of Heliopolis (Baalbek), should be identified with Hadad.

The consort of Hadad is Atargatis, the great Syrian goddess—also under the names Allât and Venus—who must not be confused with Astarte, the Phœnician goddess. Coins of Hierapolis call her 'Ate or 'Atar'ate. She was represented with her head surrounded with rays. The symbol of Atargatis was composed of the crescent moon in conjunction with the solar disk.

Besides the divine couple, Hadad and Atargatis, the Syrian pantheon included other deities, of secondary rank, several of whom had a purely local character.

Reshef, or Rashuf, was the incarnation of thunder and lightning. He was often represented as a soldier armed with spear, mace, bow, and shield; he carried on his helmet a gazelle's head surmounted by two sharp horns. Reshef is also met with in Phœnicia and in Cyprus. He was in later times identified with Apollo. Some scholars regard him as a Phœnician rather than a Syrian deity.

The inscriptions also mention Rekub-El, 'the charioteer of El,' who is probably an importation into Syria of the charioteer of the sun-god of the Assyrians. El was an important deity, but did not occupy the first rank in the Syrian pantheon.

Bel was worshipped in Syria, as in Assyria and among the other Semitic races.

Alongside of sun-worship the Syrians devoted a very special cult to the moon-god. Of two

Neirāb inscriptions (6th cent. B.C.) one mentions Sahar, Shamash, Nikkal, and Nusk, the other omits Shamash, 'the sun,' and mentions only Sahar, Nikkal, and Nusk. Sahar, the moon-god, was the chief deity of Harrān. His wife, Nikkal, corresponds to Nin-gal, 'the great lady,' wife of Sin, the Assyrian moon-god. Their son, Nusk (Nusku in Assyrian), represents fire, according to some scholars, and, according to others, he personifies the crescent moon.[1]

The stele of Teima (an oasis in the north of Arabia) names three Aramæan deities: 'Ṣalm, Singalla, and Ashira, gods of Teima.' Lagrange[2] proposes to identify Ṣalm with Salmu, the 'dark,' the dark planet, *i.e.* Saturn. According to other writers, the word *ṣalm*, 'image,' 'statue,' means the idol of the local god (*ba'al*) of Teima; Singalla is of Assyrian importation and denotes the great Sin; Ashira corresponds to the Asherah of the Canaanites.

An inscription recently discovered by Pognon in the region of Aleppo, but probably the oldest Syrian inscription, mentions not only Zakir, king of Hamath, and La'ash, but also a new deity, the god Alur (800 B.C.). He is probably a local god, the *genius loci* of Hazrak, for in the continuation of the text the important part is ascribed not to Alur but to Ba'al Shamain.

Of the three Senjirli inscriptions that of Hadad, the oldest, mentions the gods Hadad, El, Reshef, Rekub-El, Shamash, who accorded to Panammu what he asked of them. Lagrange[3] calls attention to the fact that no goddess figures in this list. The second inscription, called that of Panammu, dates from the reign of Tiglath-Pileser III. (754–727 B.C.) and mentions the gods Hadad, El, Rekub-El, Shamash, and all the gods of Jadi. The third one, called that of Barrekub, dates from the same period, but does not mention any deity, except that Barrekub declares that, on account of his loyalty, his lord Rekub-El and his lord Tiglath-Pileser have placed him on his father's throne.

When Zenobia was taken captive to Rome, the cult of the Syrian gods penetrated to the great city with her (or before her). This fact is now duly established by the discovery of a sanctuary to Janicula in the gardens of the Sciarra villa. There we read inscriptions dedicated to the Syrian god Adad (Hadad) of Lebanon on a small white marble altar. There is also an inscription dedicated 'diis syris' at Spalato.[4]

3. The Nabatæans.—According to some scholars, the Nabatæans were Arabs who used Aramæan as their literary language; according to others, on the contrary, they were pure Aramæans who in the course of their migrations mingled on the one side with the southern populations of Arabia, while to the north they became masters of Trans-Jordan as far as Damascus. The oldest Nabatæan inscriptions (1st cent. B.C.) contain no Arabisms; afterwards, at the beginning of the 1st cent. of our era, Arab influence makes itself clearly felt, especially in the regions of Ḥegrā and Medain Sāleh.

The Nabatæan sources now in our possession are inscriptions, which are published in the second part of *CIS*, and coins, which have been studied most recently by R. Dussaud and have revealed an almost unbroken succession of kings, from Obedas I. (90 B.C.) to Malichus III. (A.D. 106). But before these dates a Nabatæan race was known which in 312 B.C. was powerful enough to gain the victory against Antigonus. After this victory the Nabatæans, an essentially trading people, occupied the north of Arabia, the country of Edom, and the Damascene. F. H. Vincent has gathered together all that is known about the pantheon of the Nabatæans; they honoured the sun, to whom they built an altar on their houses, and to whom they offered libations and burned incense. The following are the principal deities. Dūshara (Dusarēs) seemed to occupy the first rank and to be the god of the king. Then came Allāt (fem. of Allah) and Manūthu or Manavat. The god Hobal belonged originally to Syria. Mutaba and Harisa are almost unknown. Qaysa was perhaps the ancient national god of the Edomites. The names of the goddesses Vagrah and Tada are from a doubtful reading as well as those of Nashbu and Elgē. The Syrian god Ba'al Shamin was also adopted by the Nabatæans. The Nabatæans erected temples to their gods. The temple comprised a small building to contain the statue of the god, a sacred enclosure (*ḥaram*), votive stelæ, and niches for the icons.

Whether the Nabatæans were strongly Aramaized Arabs or real Aramæans, they gave a very large place in their pantheon to the deities and cult-objects of Aramæan or Syrian origin. See, further, art. NABATÆANS.

5. Syrian cult.—In their pantheon, as in their religious practices, the Aramæans had naturally very close relations with the Assyro-Babylonian cults on the one hand and with those of Phœnicia and Canaan on the other. They practised the local agrarian cults, in conjunction with the worship of sun, moon, and stars, preferably on high mountains or sharp mountain-peaks, regarded as the abode of the gods. They worshipped sacred trees (the tree of life) and plants. They also rendered worship to sacred springs, and Palmyra possessed a specially consecrated river, whose Tyche was venerated. Certain sacred rivers had miraculous powers: if the offering sank to the bottom of the water, it was approved by the deity; if it floated, it was not approved.

As among the rest of the Semites, sacred enclosures have been found among the Aramæans, known as *ḥaram*, and much used among the Arabs. The boundaries of the *ḥaram* were fixed by stelæ, several of which have been recovered during the course of excavation.

We have little information concerning the after life among the Semites in general, and the Aramæans in particular. Like the ancient Hebrews, they probably had Sheol, the kingdom of the dead. From the Senjirli and Neirāb inscriptions, which are very important funerary texts, we learn that the Aramæans believed that a part of the dead person survived, called *nephesh*, 'soul.' It was a material principle, to which they had to offer food and drink.

Among the most venerated objects of worship we must mention the sacred stones, or bætyls, which assumed various aspects. The presence of the god was materialized by a stone placed in the sacred enclosure. The inscription of Hadad shows that the Aramæans worshipped the *neṣib*, a hewn stone or statue. A Palmyrenian inscription shows among the Aramæans the use of the *maṣṣēbhāh* (*q.v.*), in the sense of 'stele.' And they distinguished between the funerary stele, *nafsha*, 'soul,' of pyramidal form, and the votive stele, or *mesjida* (whence our word 'mosque,' through Arabic), which meant the place in which the deity was worshipped.

As regards the personnel of the cult, we hear of the priest, *komer*, attached to the service of such-and-such a god. It was he who offered the holocaust. Barbers played an important part, both in performing the ritual incisions and in shaving the heads of those who dedicated their hair to the deity in consequence of a vow. There were also scribes, charged more especially with keeping the accounts of the temple. Sacred prostitutes were not lacking in the Aramæan cults; and lastly we must mention the familiars of the temple, who rendered services to the faithful who came to worship or make vows, and who lived in the surroundings of the temple, finding their food in the remains of the meals offered to the gods.

6. Calendar.—The Aramæan calendar is fairly well known; the Nabatæans and Palmyrenians employed the Seleucid era, and for a very long time the Syrians made their year begin in autumn. The names of the months of the Palmyrenians are all known: Tishri, Kanun, Kslul, Ṭbt, Shbṭ, Adar, Nisan, Ir, Sion, Qinian Ab, Elul. Those of the Nabatæans are the same, except the second and tenth, which are not known. This information refers to the Aramæans in Roman times. The ancient names of the months have not yet been brought to light by the oldest inscriptions (Senjirli and Neirāb).

FRÉDÉRIC MACLER.

SYRIAN CHRISTIANS.—1. Scope of this article.—Much confusion has arisen from the fact that several different bodies of Christians—Jacobite, Maronite, Nestorian, Malabarese, and others—habitually call themselves 'Syrians,' as well as from the fact that the word 'Syria' itself has meant different things at different times. It will therefore be well at the outset to define the scope of this article.

The East Syrians or Nestorians call themselves 'Sūrāyé,' said to be a corrupt form of 'Sūryāyé.'[1] The Syrian Jacobites are in the Syriac vernacular commonly called 'Siryāné,' by way of distinction (or better 'Sūryāné' or 'Seweryāné').[2]

The name 'Syria' (Syr. Sūriyā, Gr. Συρία or Σούρ, 'e locis Palestinæ maritimis')[3] has been derived from 'Tyre' (Syr. Ṣūr), though it is spelt with a different *ṣ*. It varied in meaning from time to time. In Roman days, at the beginning of our era, it denoted the country west of the Euphrates and north of the Arabian desert, including Palestine and Palmyra, and extending north to the Taurus; though the Roman procurators or the Herods ruled all or part of Palestine, being more or less independent of the governors of the Roman province of Syria. At a later date 'Inner Syria' meant Palestine (and the coast lands to the north thereof), and 'Outer Syria' meant Mesopotamia.[4] The modern Turkish *vilayet* of Syria is only a fraction of the old Roman province, and lies east of the Lebanon, extending from Hama on the Orontes in the north to the Hedjaz in the south, Damascus being the capital, while the *vilayet* of Beirut is west of the Lebanon, and the old Judæa is an independent *sanjak* under a *muteserif*.[5] Thus the term 'Syrian Christians' has little relation to the term 'inhabitants of Syria.' The most comprehensive definition of the former is 'those Christians who use or have used the Syriac language in their liturgical services or as a vernacular.' It thus includes the Jacobites of Mesopotamia, the Nestorians, the Maronites of the Lebanon, the Syrian and Chaldæan Uniats, and the Christians of St. Thomas in Malabar.

The history of many of these Christians has usually been considered in Europe only as far as it affects their relations with certain heresies, *i.e.* only from one episode (however important) of their annals. These doctrinal questions have already been dealt with in artt. MONOTHELETISM, MONOPHYSITISM, and NESTORIANISM, and will therefore not be referred to in this article except incidentally, and when they are necessary to explain the history or customs of the Syrian Christians.

2. Syriac-speaking Christians.—Syriac is a branch of the Aramaic family of languages. The written or classical Syriac—the Syriac of the liturgies and patristic literature—was the language spoken at Edessa, and was not very distant (though differing somewhat in grammar and vocabulary) from the Aramaic of Palmyra and that of Palestine (the Biblical Aramaic of the OT, or 'Chaldee,' as it used to be called), perhaps not more distant

[1] R. Payne Smith, *Thesaurus Syriacus*, ii. 2585.
[2] *Ib.* ii. 2586. [3] *Ib.* ii. 2585. [4] *Ib.*
[5] *The Geographical Journal*, l. [1917] 13.

than some dialects of 'English' now current in the British Isles are from one another. The Edessa Syriac was the medium of commerce in the valley of the Euphrates, and was used far and wide for literary purposes. But, though this was, and is, the written language, other dialects of Syriac were spoken vernacularly throughout a very wide district, from the Mediterranean to the eastern limits of Mesopotamia, Assyria, and Adiabene (east of the Tigris), and southwards to the borders of Egypt and Arabia.[1] There were many Syriac-speaking monks in Egypt in the 4th cent. and later.[2] Even the Armenian Christians used Syriac till the 4th century.[3] Thus there were many Syriac dialects. They were not the lineal descendants of classical Syriac, but were rather in the position of sisters or nieces of that language.[4]

Syriac gradually gave way, vernacularly and to some extent liturgically, to Arabic after the Muhammadan conquest, though it has had locally a considerable influence on the vocabulary, pronunciation, and even the grammatical forms of the Arabic which supplanted it.[5] The only Christians who now speak it habitually are the East Syrians (Nestorian and Uniat Chaldæan), among whom it is practically the only language used (though many of the Mosul Uniats also speak Arabic), the Jacobites of Jebel Tūr, and the people of Ma'lūlā near Damascus. The other Jacobites and the Maronites now ordinarily use Arabic for their vernacular. The Malabarese have probably never used Syriac vernacularly—unless the immigrants from Persia used it for a while (see below, § 9)—but have always spoken an Indian dialect. It may be noted that many Jews in E. Turkey and Persia have a vernacular closely akin to the spoken Syriac of the Nestorians; and the language of the Mandæans (*q.v.*), or so-called 'Christians of St. John,' if they still exist, is another branch of Aramaic. In the early ages of Christianity the literary language of Syria proper was Greek (see below, § 3), but Syriac was the popular language there till after A.D. 500. It should be remembered that Antioch itself was a Greek, not a Syriac, centre. The city was predominantly Greek, though Syriac was the language of numerous monks in it and its neighbourhood, and of the country people.[6]

All the above-mentioned Christians use classical Syriac as their liturgical language; and many of them use it still as their literary language, as all did till the Middle Ages. It will thus be seen that the prayers in the Church services are only imperfectly, if at all, understood by the majority of the worshippers. In Syria proper, however, many of the prayers are said in an Arabic translation, so as to be intelligible to the people; they are then written in Syriac characters, and this combination of Syriac and Arabic is called Carshuni (Syr. *garshūnī*).[7] But those services which are the bishop's own—*e.g.*, ordination—are in Syriac only, as are all the prayers which are said inaudibly by the priest.

The vernaculars differ from classical Syriac in different degrees. The East Syrian vernacular dialects, which vary a good deal among themselves, differ from it perhaps as much as Italian from Latin, while the Ma'lula dialect has retained more of the older grammar and is less analytically developed.[8] This last vernacular is particularly noticeable as being preserved by those who are so far isolated from other Syriac-speaking Christians. Ma'lula (called Seleucia by the Turks) is a village of some 1000 inhabitants, situated on a high plateau about 5000 ft. above sea-level, north-east of Damascus; while two neighbouring villages, though most of their inhabitants have become Musalmāns within the last 250 years, also speak Syriac vernacularly. Ma'lula consists ecclesiastically of two divisions; half are of the Uniat Melkite rite (see below, § 6), half of the Greek Orthodox rite. Each division has an ancient monastery.[1] The local tradition is that the inhabitants are immigrants from the east, from the district of Singar or Sinjar (west of Mosul), which is now largely inhabited by Yezidis, or so-called 'devil-worshippers'; but this tradition is of very doubtful value.[2]

Of all the Syrian Christians, whether they have lost their own vernacular or have retained it, it may be noted that their clergy are supposed all to be able to read and write and understand classical Syriac; and most of them can do so, and can even, with some difficulty, speak it. But this is now only as a foreign language.

There are some differences of pronunciation. The East Syrians (Nestorian and Uniat Chaldæan) say *ā* when the West Syrians (Jacobite) and the Maronites say *ō* (*e.g.*, *malkā*, *malkō*, 'a king'), the former being the older sound, preserved to us in transliterations like Talitha (Syr. *ṭlithā*), Maranatha (Syr. Māran ethā or possibly Mārānā thā). The East Syrians hardly ever aspirate *p* (except when it is used to form a diphthong), and many of them never aspirate *t* or *d*; almost all of them pronounce the vowels Rbhāṣā (Rwāṣā) and Rwāḥā alike as *ū*, the *ō* sound being produced only by a combination of the vowel Zqāpā (Zqapha) with *w* or aspirated *b* or *p*. One point with regard to transliteration of Syriac words into Roman characters must be mentioned. European Orientalists usually write twice a medial consonant in certain verbal formations and in words derived from them, because it is said to be 'virtually doubled' (*e.g.*, 'Addai' for 'Adai'). The Syrians themselves, however, dislike doubled letters, and in their vernacular admit them only in a few (chiefly foreign) words, and in that case they pronounce each letter distinctly, like the *d*'s in 'mid-day.' On the other hand, they sometimes compensate for not doubling a medial consonant by converting a preceding short *a* into a long one. Most of them pronounce aspirated Kaph (*kh*) and Ḥeith (*ḥ*) alike.

3. Syrian Christianity in early times.—In considering the spread of Christianity in these regions before the theological controversies of the 5th cent. caused the divisions which exist to this day, we are faced with the difficulty that legends are the traditional groundwork of the religious history. It is not easy to estimate the amount of truth or falsehood that underlies the legends; but there is no doubt that all these regions were largely Christianized at an early period.

(*a*) *The Roman province of Syria.*—Here we are not troubled with legend. In the 1st cent. of our era the province extended to the Euphrates, and was conjoined with Cilicia.[3] Antioch was the civil metropolis, and was likewise the headquarters of Syrian Christianity; there the disciples were first called 'Christians' (Ac 11[26]). Greeks and Syrians were both represented at Antioch (see above, § 2). There is no evidence as to the extent to which the Church services were conducted in the Aramaic vernacular rather than in Greek; but probably, at a time when the worship was in the main extemporaneous, both languages were used. Though most of the people, perhaps, understood Greek, even if it was not their mother tongue, yet experience shows that the last sphere in which a vernacular gives way to the language of commerce and public life is that of religion. It is therefore probable that Syrian Christians in the Roman province to a large extent worshipped in their vernacular from apostolic times onwards. But Greek was the literary language. Ignatius, bishop of Antioch at the beginning of the 2nd cent., wrote in Greek (he calls himself 'bishop of Syria');[4] Lucian and Dorotheus, Diodorus, bishop of Tarsus, and Theodore, bishop of Mopsuestia (both these of Antioch), Chrysostom, Theodoret, bishop of Cyrrhus—all of the 4th and 5th centuries—did

the same. The Antiochene school of theology was clearly a Greek school.[1] A trace of the mixture of the Greek and Syriac elements may be seen in the *Pilgrimage of 'Silvia'* ('*Etheria*'), a work probably of the end of the 4th cent., which describes the bishop of Jerusalem as knowing Syriac ('*siriste*'), but as always speaking Greek and having his sermons and the lections interpreted into Syriac by a presbyter who stood by.[2]

In the 4th cent., when the provincial organization of the Church was promoted, Antioch was one of the great centres, and its bishop was called a 'metropolitan'; the corresponding verb is found in canon 19 of the Council of Antioch *in encœniis* (A.D. 341), and the name itself in can. 6 of Nicæa (A.D. 325), which says that the rights formerly possessed by Antioch must be preserved to it. Thus Antioch had long exercised some sort of jurisdiction over neighbouring sees. Yet the *Apostolic Constitutions*, a Greek work written in Syria *c.* A.D. 375, does not mention metropolitans, any more than the other 'Church Orders' do.[3] This is important in connexion with the supposed dependence of Seleucia-Ctesiphon on Antioch, for which see below (*c*).

(*b*) *Edessa.*—This famous city of Mesopotamia, called in Syriac Ur-hai (now Urfa), was the capital of the kingdom of Osrhoëne (a Greek name derived from 'Ur-hai'). 'Edessa' was the Greek name for the city. The kingdom was independent till A.D. 216, when it was incorporated in the Roman empire. According to the well-known legend of Abgar and Addai, Edessa was Christianized in the middle of the 1st cent.; the legend is given in full in the *Doctrine of Addai* (see below, § 4), and in a shorter, and perhaps more original, form by Eusebius,[4] who says that his account was translated from the Syriac. Edessa is represented as a heathen city, which worshipped (the *Doctrine* tells us) Bel and Nebo,[5] though Burkitt suggests that these names come from a perusal of the OT and not from any real historical reminiscence.[6] Abgar,[7] the heathen king or toparch of Edessa, sends messengers to our Lord, and a correspondence ensues; after the Ascension the apostle 'Judas Thomas' sends Addai (called by Eusebius Thaddæus, and said to be one of the Seventy) to Abgar to teach him the faith.[8] Addai does many mighty deeds; one of his converts was Aggai, who 'made the silks and headbands of the king,' and he was made bishop[9] by Addai as his successor. Addai died a natural death at Edessa, but Aggai was afterwards martyred by the son of Abgar; and, as he could not consecrate his successor Palūṭ by reason of his sudden death, the latter was sent to Antioch and was ordained by Serapion the bishop. Narsai, king of Assyria, sent messengers to King Abgar to learn about all these matters. Such is the legend. As we have it, it is of the 4th cent., though clearly based on one that is a good deal older; R. A. Lipsius[10] concludes that the extant correspondence between our Lord and Abgar was manufactured *c.* A.D. 200. What is the substratum of truth in all this it is not easy to say. The mention of Serapion (bishop of Antioch, A.D. 190–210) gives us a date for Palūṭ, and Lipsius[11] regards the latter as the first historical bishop of Edessa. But there is no need to dismiss Addai entirely to the realms of myth. If the Edessenes were casting about for an early founder of their Church, they would be much more likely to fix on the great apostle 'Judas Thomas,' whose tomb was claimed for Edessa in the middle of the 3rd cent. (see below, § 9), than on the unknown Addai. It seems to be likely, therefore, that Addai (probably a Palestinian Jew) was the first preacher of the gospel at Edessa, perhaps early in, or about the middle of, the 2nd century. The real Abgar who favoured Christianity may have been Abgar IX., the last independent king of Edessa. Burkitt[1] suggests that the consecration of Palūṭ by Serapion of Antioch represents a movement for closer union with 'Western' (Greek) Christianity, and perhaps means a break in the episcopal succession.

In the 2nd cent. **Bardaiṣān** (Bardesanes) was born at Edessa (A.D. 155–223?);[2] he is reckoned as a Syrian Gnostic (though this is doubtful), and was a most learned man, a great hymn-writer,[3] and author of a polemic against Marcion. All his works have perished except the extant Syriac treatise *de Fato*, which is usually thought to be his; Eusebius[4] tells us that he wrote a book with that title. Burkitt[5] assigns the *de Fato* (which is called in the MS the *Book of the Laws of Countries*) to Bardaiṣān's disciple, Philip, on the strength of the work itself; but many think that the insertion of 'Philip' (a very unusual Syriac name) is only a literary device, and that Bardaiṣān himself is the real author. He certainly is the chief speaker in the dialogue, which is between a Christian and a heathen, and turns largely on the question why God allowed man to sin. Eusebius[6] and Epiphanius[7] say that Bardaiṣān was originally a follower of Valentinus, and Epiphanius makes him always a Valentinian. The fullest biography of this erratic writer is by Michael the Syrian, Jacobite patriarch of Antioch (1166–99), but his details cannot be entirely trusted. The school of Bardaiṣān survived his death, and remained in opposition to the orthodox party; Rabbula is said to have converted the remnants of it.[8]

One of the most famous of the Edessenes was **Ephraim** (Ephrem) **the Syrian** (born *c.* 308, †373). He came from Nisibis[9] to Edessa and founded or reorganized a seminary there, which became the great university of the East, though for a while after his death it fell under Arian influences. He was a deacon only, said to have been ordained by Basil of the Cappadocian Cæsarea, and to have declined advancement;[10] his own statement, that he had 'the talent of the priesthood,'[11] does not contradict this, for in Syriac 'priesthood' (*kāhnūthā*) includes all orders of the ministry. He was a most diffuse writer, and achieved a great fame in posterity.[12]

In the 5th cent. the most famous Edessenes were two of the bishops of Edessa. **Rabbūlā** (bishop from 411 to 435) was the son of a heathen priest and of a Christian mother. He was converted

9 As appears both from the Syriac (Nṣibbin, pron. Nṣiwin) and from the Greek, the middle *i* is long, contrary to the ordinary pronunciation. The word forms the end of a Greek hexameter in the epitaph of Abercius; see the restoration in Lightfoot, *Ignatius and Polycarp*[2], i. 496. Burkitt has pointed out to the present writer that the pronunciation with short *i* perhaps comes from the Armenian form of the name, 'Mtsbin.'

after he attained to manhood; and he became a great ascetic, and the friend of Cyril of Alexandria. At the end of his life he strenuously opposed Nestorius.[1] The other famous bishop was his successor, Ibas (bishop from 435 to 457), who was inclined to favour Nestorius (see below, § 8).

During all this period the Church seems to have made rapid progress. Eusebius[2] says that bishops from 'the whole of Syria and Mesopotamia' attended the dedication of Constantine's great church at Jerusalem in 335.

(c) *The Persian empire.*—A great deal of light has been thrown on early Syrian Christianity in Persia by the recent publication of the works of Nestorian writers. Formerly we had to rely mainly on the accounts of Jacobite authors like Bar Hebræus. The two sets of accounts correct one another and disprove more than one myth; and Neale's narrative in his *History of the Holy Eastern Church*[3] needs much correction in this respect.

One legend is a continuation of that of Abgar and Addai already mentioned. Mari, disciple of Addai, travelled from Edessa and evangelized 'Persia' (*i.e.* what became later the eastern part of Asiatic Turkey, as well as the modern Persia), penetrating as far as the province of Fars. Mari is not mentioned in the *Doctrine of Addai*, which, however, has a hint that Christianity extended from Edessa into Persia. Nor is Mari mentioned in the lately published and very valuable *History* of Mshîḥâ Zkhâ (lit. 'Christ has conquered'), of the 6th cent., which states that Addai was the apostle of Adiabene and Assyria (this apparently contradicts the *Doctrine*, which makes Addai live and die at Edessa), and that he ordained Pqîdhâ as first bishop there. The Nestorian *Sûnhâdhûs*, or Book of Canon Law,[4] names as the 'converters' of that region Thomas 'of the Indians and Chinese' (*Sînâyê*), 'Bartholomew, that is Nathanael, of the Aramæans, Addai of the Seventy, the teacher of Aggai, and Mari of Mesopotamia and of all Persia.'[5] This is all clearly mythical, but is there any truth underlying the legend? Some consider that there was no Christianity, or at least no organization of Christianity, east of the Tigris before the Sasanid empire was established by a revolution, A.D. 225. This is perhaps going rather too far. If there was nothing before the third decade of the 3rd cent. to build upon, it is unlikely that so early a writer as Mshîḥa Zkha could have given us such details; he could not have invented Pqîdhâ out of nothing. It is quite probable that there were Christians in Assyria in the 2nd cent., for Tatian,[6] the disciple of Justin Martyr, tells us that he was born 'in the land of the Assyrians.' This must be discounted by the fact that he probably wrote only in Greek, though many think that his *Diatessaron* (for which see below, § 4) was written in Syriac;[7] and that he may therefore have been of Greek parentage, and have been converted to Christianity when in the West. We learn from Epiphanius that he laboured in Syria and Mesopotamia.[8] In any case there was no bishop at Seleucia-Ctesiphon, the twin-capital of the Persian empire, situated on the Tigris below Baghdâd, till the end of the 3rd century. Papa is the first known bishop of that city; he was consecrated *c.* 280.

Another legend is much later, and professes to account for the existence of a patriarch at Seleucia-Ctesiphon. It is given by Bar Hebræus and other writers, and in the *Sûnhâdhûs*,[9] and is to the effect that two men went from Persia to Antioch to receive the episcopate in 190. According to the first writer, one of them was crucified as a Persian spy, as was Ṣlîbha (pron. Ṣlîwâ, lit. 'cross,' still a common name), the bishop of Antioch, while the other escaped to Jerusalem and was consecrated there, returning with a letter conferring the patriarchate on the Church in Persia. The *Sûnhâdhûs* does not name Ṣlîbha, but says that two patriarchs, 'one of the East and one of the West,'[10] were crucified on the doors of the church of Antioch, and it gives the pretended letter of the 'Western patriarchs' to the 'Easterns,' bestowing on the latter a patriarchate, and absolving them from the duty of sending their patriarchs to Antioch to be consecrated. The first patriarch, it says, was either Papa or Shaḥlûpâ—it does not profess to be certain.[11] This Shaḥlûpâ was probably the bishop of Adiabene, east of the Tigris and between the two Zabs, who was a contemporary of Papa. The letter of the 'Westerns' is a late forgery. The earlier writers, like Mshîḥa Zkha, know nothing of the story, despite the fact that that historian wrote the life of Aḥâ d'abhûh, the bishop who is said to have escaped. The whole is doubtless a fiction, and it is improbable that the Persian Christians ever depended for their bishops on Antioch, though they doubtless received their Christianity from Edessa, and Edessa possibly received it from Antioch. The idea of patriarchates, it need hardly be said, belongs to a much later time than these pretended events. The East Syrian ('Persian') metropolitanates were organized *c.* A.D. 410. There is no early evidence of Antioch exercising jurisdiction over the Church in Persia. When Papa was condemned by his brother bishops, he appealed, successfully, to Edessa, and perhaps to Nisibis.[1]

An important event for the Church occurred in A.D. 297, when five Persian provinces were ceded to the Roman emperor.[2] This strengthened the ecclesiastical ties between East and 'West.' The cession made Nisibis a Roman city. Its most famous bishop at that time was **James of Nisibis**, who was born there towards the end of the 3rd century. Ephraim was his disciple, and was baptized by him. James himself was a great author of Syriac works.[3]

It is remarkable that, though James was present at Nicæa in A.D. 325, the East Syrians knew nothing officially of that council till the Synod of Seleucia-Ctesiphon in A.D. 410, when they freely accepted the Nicene decrees and creed. To this day they use a rather peculiar version of the longer form, the so-called 'Constantinople' creed, which came into general use (see below, § 9). The Arian controversy did not touch them; and an illustration of this may be seen in the fact that Aphraates, whose Homilies (see below, § 4) are a continuous exposition of the Christian faith, does not mention Arianism at all, though he lived at a time when that heresy was prevalent in the 'West.'

The principal East Syrian bishops of Seleucia-Ctesiphon after Papa and before the Nestorian period were **Simeon Bar Sabâ'ê** (martyred under Sapor II.), **Yahbh-alaha I.** (pron. Yâw-alâhâ), and **Dâdhîshû**. Of other bishops may be specially mentioned **Aphraates** (Aphrâhât), in the 4th cent., whose see was perhaps Mar Mattai, near Mosul (see below, § 5), and **Mârûthâ** (early 5th cent.), bishop of Maipharqat or Martyropolis, north of Nisibis, author of the *Book of Martyrs* (see below, § 4). Mârûthâ often acted as adviser to the Persian king and as ambassador to the Roman emperor. The *Sûnhâdhûs*[4] mentions an earlier Mârûthâ, who was (it says) present at Nicæa, but it is probable that he did not exist, and that the statement is due to a confusion.

The period was marked by many personal quarrels,[5] a feature of later history also, and by the great persecution under King Sapor II. († A.D. 379), which lasted some 40 years and resulted in many martyrdoms.[6] The Persian kings at one time favoured the Church and at another persecuted it. It is important to notice that even in the early days the political conditions tended, quite apart from theological considerations, to separate the East Syrians from the rest of Christendom. It was the policy of the Persian authorities when they tolerated Christianity to separate it as much as possible from that in the rival Roman empire. Another persecution, at the instigation of the Magians, whose religion was that of the State, broke out under King Bahram (Vararanes) V., *c.* A.D. 420. Theodoret[7] makes it arise under his predecessor Yazdegerd, though continued under Bahram, but Socrates[8] says more accurately that it arose after Yazdegerd's death.

The title of the bishops of Seleucia-Ctesiphon, *c.* A.D. 400, was 'the Catholicos of the East,' and this is still preserved by their successors. The title 'Patriarch' was added a little later, at the Council of Dadhishu, held A.D. 424 at 'Markabta of the

Arabs.' This council firmly established the independence of the 'Eastern' patriarchate.

4. The Syriac Bible and early Syriac literature.—Before the doctrinal divisions of the 5th cent. there was a considerable activity in Syriac literature, all written in what we call 'classical Syriac' (see above, § 2). The Gospels were current in Syriac in five forms. (*a*) The four 'Gospels separate' (Syr. *Ewangelîyōn da-Mpharrshé*), now generally called the 'Old Syriac,' are known to us by two MSS: the Curetonian, discovered in Egypt in 1842, and ed. by Cureton in 1858; and the Sinaitic Syriac, a palimpsest discovered by Mrs. Gibson in the monastery of Mount Sinai in 1893. Both of these have the above Syriac title, which distinguishes them from the *Diatessaron* (see below). Both are perhaps of the 4th century. The Curetonian has the same type of text as the Sinaitic, but differs from it in many details.[1]

(*b*) The *Diatessaron* of Tatian (2nd cent.), sometimes called by the Syrians 'the Mixed [Gospels],'[2] is a harmony of the four Gospels, and is known to us through a commentary on it by Ephraim handed down in an Armenian translation, by quotations in Aphraates, and by an Arabic translation of the Harmony itself made in the 11th cent. by the Nestorian monk Ibn at-Ṭayyib.[3] The *Diatessaron* is mentioned in the *Doctrine of Addai*.

(*c*) The Pshîṭṭā,[4] or 'simple' version, so called to distinguish it from the complicated recension of Thomas of Ḥarqel (see below), is the version still used by Syrian Christians. The name is first found in the 8th or 9th century. This version, which is now often called 'the Syriac Vulgate,' contains the whole Bible, OT and NT (including the OT Apocrypha), less 2 Peter, 2 and 3 John, Jude, and Revelation. Because of its universal acceptance, it may safely be assigned to a date before the divisions of the 5th century. The Gospels in this version have been critically edited by G. H. Gwilliam.[5] It appears that Tatian's Harmony was at one time in popular use among the Syrian Christians, but early in the 5th cent. Rabbūlā, bishop of Edessa (see above, § 3), and Theodoret, bishop of Cyrrhus, were instrumental in its being abolished and destroyed in favour of the 'separate Gospels.' Burkitt's theory has been very generally accepted, viz. that the Pshîṭṭā Gospels are a revision of the 'separate Gospels' made early in the 5th cent. under the direction of Rabbūlā; that the *Diatessaron* was written in Greek (but see above, § 3), probably at Rome, by Tatian, and translated into Syriac in his lifetime, *c.* A.D. 170; and that the 'separate Gospels' date from *c.* A.D. 200, the translator being familiar with the *Diatessaron*.[6] These views are combated by Gwilliam, who is inclined to assign a much earlier date to the Pshîṭṭā Gospels;[7] he objects that Burkitt's theory is not adequately attested, does not explain the disappearance of the 'Old Syriac,' and does not account for the acceptance of the Pshîṭṭā in the 5th cent. by Nestorians and Jacobites alike.[8] The fact that the East Syrians were not definitely Nestorian in Rabbūlā's time, or indeed for a long time after him (see below, § 8), appears to the present writer adequately to account for their being ready enough to accept such a version of the Gospels in place of the *Diatessaron*.

[1] For these two MSS see F. C. Burkitt, *Evangelion da-Mepharreshe*, Cambridge, 1904. For the date see Burkitt, *Early Christianity outside the Roman Empire*, p. 54, and *Evang.* ii. 13, 28.
[2] Burkitt, *Evang.* ii. 115. [3] *Ib.* ii. 4.
[4] Usually written in English Peshitta, Peshitto, or Peshito, but all these forms give the ordinary reader an erroneous idea of the pronunciation of the first syllable. Also the first *t* is pronounced quite differently from the second.
[5] *Tetraeuangelium Sanctum*, Oxford, 1901.
[6] Burkitt, *Evang.* ii. 5.
[7] *Studia Biblica et Ecclesiastica*, v. [Oxford, 1903] 189 ff.
[8] On this last point see Burkitt, *Evang.* ii. 162, and *Early Eastern Christianity*, p. 59 ff.

(*d*) Recensions of the Pshîṭṭā were made by **Philoxenus**, bishop of Mabug (Hierapolis, near the Euphrates), A.D. 508 (not now extant), and by **Thomas of Ḥarqel** ('Harklean' version), A.D. 616. Both of these writers were Monophysites, and it appears that the only dissatisfaction with the Pshîṭṭā that made itself felt was among the Jacobites, and not among the Nestorians. But even among the Jacobites that version remained supreme.

Some characteristics of the Pshîṭṭā may here be mentioned. Its MSS, unlike those of the Greek Bible in the 5th cent., all show practically the same text. Some of them are as old as the 5th cent., the oldest *c.* A.D. 450. One rather noticeable difference between the 'Old Syriac' and the Pshîṭṭā Gospels occurs in the Lord's Prayer, where the former has 'our continual bread,' the latter 'the bread of our need.' Another difference is in the gender of 'Holy Spirit.' The noun 'spirit' being feminine in Syriac, the older writers make 'Holy Spirit' feminine also, and Aphraates speaks of the Holy Ghost as 'our mother,' just as the *Gospel according to the Hebrews* speaks of Him as our Lord's mother. But from the time of the Pshîṭṭā onwards 'Holy Spirit' is made masculine by a grammatical revolution, though in Lk 4^1 and Jn 7^{39} Psh there is a survival of the older usage, the feminine being retained.

Hitherto we have considered only the Gospels. There is no extant text of Acts or the Epistles older than the Pshîṭṭā, but quotations in Aphraates and in Ephraim's *Commentary on the Pauline Epistles*, now extant only in an Armenian translation, are of some slight help.[1] In Aphraates and in the genuine works of Ephraim there is no clear reference to any of the Catholic Epistles. The *Doctrine of Addai* expressly confines the Scriptural canon to the Law and the Prophets, the Gospel, St. Paul's Epistles, and Acts. Thus the Pshîṭṭā, admitting as it does the principal Catholic Epistles, shows an advance on the way to a fuller canon.[2] The Pshîṭṭā OT was not revised by Rabbūlā, and is undoubtedly much older than his time, perhaps dating from the end of the 2nd century.[3] The translator had a good knowledge of Hebrew, though he was somewhat influenced by the Septuagint. Burkitt thinks that he must have been a Jew, and that he made his translation for the Jews, who had probably settled at Edessa before it became a Christian centre. The OT quotations of the *Acts of Judas Thomas*, the *Doctrine of Addai*, the *Edessene Canons*, Aphraates, Cyrillona, and the genuine works of Ephraim (for all these see below) agree largely with the Pshîṭṭā, but their Gospel quotations do not do so, rather resembling the 'Old Syriac' and the *Diatessaron*. After Rabbūlā all the quotations but two agree with the Pshîṭṭā, the 'Old Syriac' having thus almost entirely disappeared.[4] The 'Old Syriac' Gospels appear to be later than the Pshîṭṭā OT, as the translator of the former, translating direct from the Greek, uses Hebrew proper names correctly transliterated from the Hebrew, as does the Pshîṭṭā translator of the OT. The Old Syriac Gospel translator could hardly do this unless he had the correct forms of the proper names before him already in use.[5]

Of other early Syriac works, in addition to liturgies, some of which seem in their main features to have been written before the middle of the 5th cent., and in addition also to early Syriac translations of Greek books, the following may be mentioned. (1) *The Disputation with Manes*, by **Archelaus**, bishop of Kashkar in Mesopotamia (3rd cent.?), is now extant only in Greek fragments and in a Latin translation, but was originally written in Syriac. (2) The *Doctrine of Addai*,[6] already mentioned, is a work of the latter part, or, according to R. A. Lipsius,[7] of the beginning, of the 4th cent., giving the legend of Abgar (see above, § 3). (3) The voluminous works of **Ephraim** consist of commentaries, homilies, letters, and hymns.[8] At least one of his works, *On the Holy Spirit*, was translated into Greek before Jerome's time.[9] (4) **Aphraates**, the Persian martyr and sage, wrote his *Homilies* A.D. 337–345. Their theological attitude calls for some remark in view of their aloofness from Hellenistic influence. There is no special difference between him and 'Western' writers in the presentment of the doctrine of the Holy Trinity, and in Aphraates, as elsewhere, baptism is 'in the name of the Father and of the Son and of the Holy

Ghost.' Man is a temple for God to dwell in.[1] But the doctrine of the sacraments must be noticed. The teaching about the eucharist, indeed, is more or less that of the Greek-speaking Christians. The body and blood of our Lord are received by the faithful. Fasting communion is enjoined, but special stress is laid on fasting from sin. Yet this seems to be only the complement and groundwork of the literal fasting. One passage,[2] however, is thought by Burkitt[3] to show that Aphraates considered baptism, and the sacramental system generally, to be only for ascetics, and not for the married laity. This conclusion has been much disputed. At least it is certain that Aphraates favoured the postponing of baptism till after marriage, just as Constantine postponed it till the end of his life. The same tinge of ultra-asceticism is seen here that appears in the *Acts of Judas Thomas* (see below and § 9). But there is no evidence that this was more than the private opinion of individuals, or that the original East Syrian Church as a whole considered full membership to be incompatible with anything but the ascetic life. (5) The Syriac *Doctrina Apostolorum* (or *Edessene Canons*) was written *c.* A.D. 350 and is a kind of 'Church Order.' As is the case with many books of that class, it puts injunctions into the mouth of the apostles, and it is of great interest as telling us of the customs of the Edessene Church in the 4th century. It makes Addai the apostle of Edessa, and Aggai, 'a maker of silks,' the apostle of Persia, Assyria, Armenia, Media, the countries round Babylon, the 'Huzites and the Gelae, as far as the borders of the Indians and as far as the land of Gog and Magog.' This shows that the East Syrians at a very early date were a missionary body. (6) The *Syriac Martyrology* may be dated *c.* A.D. 350. It is found in the MS (dated 411) mentioned below. It mentions Ḥabbîb the deacon, as well as Shamuna and Guria (on whom a metrical homily is extant), but not Aggai, Sharbil, or Barsamya (see below). (7) **Abba** (Abha, pron. Awā), the disciple of Ephraim, wrote a commentary on the Gospels, of which only a few fragments remain. (8) **Cyrillona** wrote his poems *c.* A.D. 396.[4] (9) The *Martyrdoms of Barsamya and of Ḥabbîb*, and (10) the *Acts* or *Hypomnemata of Sharbil*, are accounts of the deaths of three Edessene heroes.[5] (11) The *de Fato* of Bardaiṣān (?) has already been mentioned (§ 3). (12) **Mārūthā** (§ 3) wrote his *Book of Martyrs* early in the 5th cent. to commemorate those who suffered in Persia in the great persecution of Sapor II. (13) The *Life of Rabbūlā* (see above) was written shortly after his death, A.D. 435. (14) The *Acts of Judas Thomas* (the apostle) is a highly interesting religious novel, written by one who was of doubtful orthodoxy, but was perhaps a pioneer missionary in E. Mesopotamia in the 3rd cent., or possibly Bardaiṣan himself, or at any rate one of his school. The Syriac origin of this work is maintained by T. Nöldeke and F. C. Burkitt[6] and others.[7] The *Acts* contain the well-known *Hymn of the Soul*, for an English translation of which see Burkitt's *Early Eastern Christianity*, p. 218 ff.; but the hymn is really an independent Syriac composition added to the *Acts*. These *Acts*, while unorthodox, are probably not Gnostic, being very different from the Greek *Acts of John*, which are thoroughly Gnostic. In the Syriac *Acts* there is no inner circle to whom alone the whole truth is taught.[1] (15) Syriac may be the original language of the Clementine story which has been reproduced in the *Clementine Homilies and Recognitions*. An earlier form of the story,[2] perhaps of the 3rd cent., has lately been discovered in Syriac.[3]

There are also several translations of Greek works into Syriac which were made before the great separation of Syrian Christians. Thus the works of Eusebius were so translated very shortly after his death; a MS of a Syriac version of the *Martyrs of Palestine* and the *Theophania* is extant, dated A.D. 411, and this is not the original autograph,[4] and another of the *Ecclesiastical History* is extant dated A.D. 462.[5] Pamphilus the martyr, Eusebius's teacher, had a society, *c.* A.D. 300, which translated Greek works into Syriac.[6] The Ignatian Epistles were translated into Syriac (the 'Curetonian Syriac Letters') at least in the 5th cent., and, if the six additional letters are not an integral part of this version, probably earlier.[7] It is noteworthy that Syrian Christians, by means of classical Syriac, made many Greek works, philosophical, scientific, and religious, known to the East. Some Greek works are known to us only in their Syriac dress; and even some works in Armenian come to us from the Greek through the Syriac. The principal era of Armenian translations from the Syriac was the 5th century.[8]

5. West Syrians or Jacobites.—We now proceed to consider the divisions of Syrian Christianity which resulted from the Christological controversies of the 5th century. It is not necessary here to repeat the accounts of those controversies which have already been given in this *Encyclopædia*; but we may discuss the general history and the customs of the different Syrian bodies which separated from one another and from the 'Western' Church of Constantinople and Rome.

The Syrian Monophysites may be considered first.[9] In Syria proper there was a constant contention between them and the Orthodox for more than a hundred years after the Council of Chalcedon (A.D. 451), and the patriarchs of Antioch were sometimes Orthodox and sometimes Monophysite. The most famous of the latter was **Severus**, who maintained possession of Antioch itself from A.D. 513 to 518; he was an author, and wrote in Greek. He was a great admirer and quoter of Ignatius's Epistles.[10] He was the leader of his party till his death *c.* A.D. 540, after which a double succession to the patriarchate was continuous; and it has been preserved to the present day. The final breach between Orthodox and Monophysites may be said to have occurred in the reign of Justin II., the successor of Justinian. He persecuted the Monophysites, and an account of these troubles may be read in the third book (the only part extant) of **John of Ephesus**, a contemporary. John was Monophysite bishop of Ephesus in the 6th cent., but he wrote in Syriac, and was the first Syriac historian. He was a native of Amida (Diarbekr). For **James of Sarug** († A.D. 521 or 522), who has been thought to have been a Monophysite (but this is very doubtful), and for other early Syrian poets, see art. HYMNS (Syriac Christian), § 1.

The Syrian Monophysites are called **Jacobites** from **Jacob Baradai** (Baradæus), or Zanzalus, a monk of a monastery near Edessa, who came to Constantinople *c.* A.D. 540 to plead the cause of Monophysitism. After remaining there fifteen

9 For the struggle between Monophysitism and orthodoxy after the Council of Chalcedon, and for the alternately favourable and unfavourable attitude of the Byzantine Court towards the latter, see art. MONOPHYSITISM. With the opponents of Chalcedon in Egypt and in Armenia we are not here concerned.
10 Lightfoot, i. 178.

years, he was consecrated bishop by the imprisoned Monophysite bishops in the capital, and sent to Syria to organize his sect. He consecrated Sergius to succeed Severus at Antioch, and appointed Paul the Black to succeed Sergius. He is said to have ordained two patriarchs, 89 bishops, and an enormous number of clergy. He is often called bishop of Edessa, but Bar Hebræus[1] says that he was a bishop with no fixed see. John of Ephesus was his panegyrist. He died in 578, and after his death the Monophysites were driven from Antioch. The term 'Jacobites' was a nickname, given by the Orthodox; but the Jacobites themselves readily accepted it, tracing it, however erroneously, to the apostle James, to whom also they ascribe their principal liturgy. Their controversy with the Greeks, like the controversy of the East Syrians with the Greeks, was not only theological; it was largely tinged with national differences. Indeed both were to a considerable extent contests between Syriac thought and Hellenistic culture.

In the 7th cent. the Muhammadans conquered Palestine, Syria, and the East; and at first the new rulers favoured the Jacobites as the rivals of the Greeks. The principal writer of this period was **James (Jacob) of Edessa** († 708), who was a poet, commentator, and letter-writer, and a voluminous translator of Greek works into Syriac. To him, *e.g.*, we owe the knowledge of the 'Church Order' called the *Testament of our Lord*, a Greek work of c. A.D. 350, now extant only in Syriac.

The Jacobite patriarchs have continued to this day (at any rate from the 13th cent., or, according to Neale,[2] from the end of the 16th cent.) to style themselves 'of Antioch,' though they transferred their residence to various places—to Malatia on the Euphrates, to Amida, and finally (in the 12th cent.) to the monastery of Deir-el-Za'afaran (the 'saffron monastery') near Mardin, where they have been ever since.

Perhaps the most eminent Jacobite of all history was **Gregory Bar Hebræus,** or Abulfaraj († 1286), a man of Jewish parentage, who became a convert to Christianity and afterwards *maphrian* or metropolitan of Moṣul, having formerly held other sees.[3] He wrote many works, and his *Chronicle* (which may be read in Assemani) is a valuable history. He seems to have been greatly esteemed even by his Nestorian opponents, who attended his funeral in large numbers; he died at Maragha (south of Tabriz), but was buried in the monastery of Mar Mattai on Jebel Maqlub (Syr. Elpeph), a day's ride north-east of Moṣul, and his grave is still shown there. His *Chronicle* is, for his age, fairly trustworthy, but when he deals with Nestorian matters it should be compared with the writings of that body.

A less known Jacobite writer was **Dionysius Bar-ṣalibi** (Syr. ṣlibhi, pron. ṣliwi), also called James, metropolitan of Amida, a theologian and commentator, probably of the 11th century.[4]

We know less of Jacobite organization and customs, ecclesiastical and liturgical, than we do of those of the Nestorians, of which we have been fully informed in the last quarter of a century. For the modern Jacobites the best short account is to be found in O. H. Parry's *Six Months in a Syrian Monastery*, which has been largely drawn upon in the description which follows. The ecclesiastical hierarchy consists of the patriarch; the maphrian, who since the 12th cent. has had his see at Mar Mattai (see above) or in Moṣul itself; and bishops of Jerusalem, Damascus or Homs (Emessa), Edessa, Amida, Mardin, Nisibis, Maipharqat (now Farqin; see above, § 3) and Ma'dan, Aleppo, Jezireh (on the Tigris), and Ṭur 'Abhdin (Jebel Ṭur). There are also some bishops without sees, as at Mar Mattai, where, when the present writer visited the monastery in 1887, the establishment consisted of one bishop and one monk. The patriarch is elected by the people, and the election is confirmed by the bishops resident near Mardin; it is common for the maphrian to be promoted to the chief position. The patriarch, or more rarely the maphrian, consecrates all the bishops, who must be either monks or widowed priests; those chosen from the monks are called *maṭrān*, or 'metropolitan,' while those chosen from the widowed priests are called *asqof* (ἐπίσκοπος), and are of slightly lower rank, not being eligible for the patriarchate or maphrianate. Each bishop has the prefix 'Mār' ('my lord') before his name.[1] The patriarch and the other bishops are recognized by the State as judges for their own people, especially in minor matters, and in questions of marriage and divorce. The canonical age for the ordination of bishops is 35, of deacons 20; but this has never been kept as a fixed rule. Bar Hebræus was ordained bishop at 20; deacons are often ordained as little boys, but they must be able to read the Psalms in classical Syriac. The parish priests, who are elected by the parish councils of deacons and laymen, must be married men; if their wives die, they enter a monastery or else become *asqofs*. A second marriage is not allowed to them. The priests must let their beards grow, but they shave their heads completely. The leading priest in a large town is often made a chorepiscopus, but he is not a bishop, and cannot ordain. There are many deacons in each village—they are engaged in secular work during the week—as they are indispensable for the celebration of the eucharist. Minor orders are practically obsolete.

Several ground-plans of churches may be seen in Parry.[2] The altar, at least in most cases, stands in an apse, not (as among the Nestorians) attached to the east wall, and there are seats for bishops and clergy behind. This is also the usual Greek custom. The whole sanctuary in Syrian churches, Eastern and Western, is called 'the altar' (Syr. *madhb'hā*), though this name is sometimes also given to the holy table itself. The latter is usually of stone, though in some of the Jacobite churches it is of wood.[3] There are side chapels with 'altars,' north and south of the sanctuary—the churches face east—and in some cases, as at Mar Mattai, there is another chapel at the north side for the burial of bishops, called *beith qaddîshé* ('house of the saints'). Between sanctuary and nave there is a stone wall or screen, sometimes with folding doors, and always with a veil. The nave has no furniture except one or two lecterns. The altar is usually placed under a baldacchino. The Jacobites, like the Nestorians, do not allow images in their churches, but have a great veneration for the cross.

Monasteries are common; the monks are often laymen, though they are sometimes in holy orders. The monasteries are under the rule of the diocesan bishop except where they contain the tomb of a patriarch or a maphrian; in that case they are directly under the patriarch. Nunneries seem to be obsolete. The technical Syriac term for the monastic life, among both the Jacobites and the Nestorians, is 'sadness,' 'mourning.'[4]

The eucharistic liturgy ordinarily used is that of 'St. James,' a translation of which, in the Jacobite form, is given in Brightman's *Liturgies Eastern and Western*, i. 69 ff. The Syrian Jacobites, Maronites, Uniat Syrians, and Malabar Jacobites all use the same liturgy with some variations.[5] Leavened bread is used, and must be baked for each occasion. The leaven is handed down from remote ages, as among the Nestorians. The eucharist is reserved for the sick, but only for communion on the same day. Little children (who are confirmed immediately after baptism) are communicated.

[5] For a list of other Jacobite liturgies see Brightman, i p. lviii ff.

The antidoron or eucharistic bread not consecrated (Syr. *būrktha* = εὐλογία) is distributed after the service. The celebrant wears albe, amice, undivided stole, yellow shoes, a maniple over each arm, and a chasuble split down the front and buckled with silver at the neck. The vesting takes place in the side chapel, where also the elements are prepared. There are in some churches daily eucharists. There are no special vestments (except girdles, and often, for the deacons, stoles) at the daily offices. These last have not been published, and exist in manuscript only. One of the great features of Jacobite worship is the peculiar addition of 'who wast crucified for us' to the Trisagion ('Holy God, Holy Mighty, Holy Immortal, have mercy upon us'), which is used at many of the services. The addition was first made by Peter the Fuller († A.D. 477), and was eagerly adopted and retained as a test of Monophysitism.[1] Baptism is not allowed to be administered in private houses. The child at baptism is signed with *moron*, or unguent (which is consecrated once a year by the patriarch), anointed all over the body with oil (which has been hallowed by the *moron*), immersed in water thrice up to the neck, clothed, and confirmed.[2] Confession before communion is recommended by the canons, but is now almost obsolete. Some of the canons[3] are more strict, and insist on confession before communion on Maundy Thursday, Christmas, and Pentecost.[4] The fasts are somewhat severe. Besides Lent and Advent, both of which are strict fasts, there are (*a*) the Fast of the Ninevites, three days in spring, said to have been instituted owing to a plague in the 6th cent.,[5] and strenuously maintained also by the East Syrians; (*b*) the Fast of the Apostles, after Pentecost; and (*c*) the Fast of Mary, August 1-15. Wednesday and Friday are fasts in each week, from sunset to sunset.

The Jacobites are to be found chiefly in Mesopotamia and northwards to Ḫarput and Diarbekr, but there are also a good many of them near Damascus and a certain number around Moṣul. The largest numbers are perhaps to be found in the hilly region of Jebel Ṭur (Arab. also Ṭūr 'Abdīn; Syr. Ṭūr 'Abhdīn), N. of the line Mardin—Nisibis —Jezireh. In this district Syriac is still spoken vernacularly. Here some of their oldest and most interesting churches are situated.[6] It is always difficult to reckon numbers in Turkey; but Gibbon's estimate[7] of from fifty to eighty thousand is certainly too low. We may perhaps put the total in Turkey at rather less than 200,000.[8]

Certain communities of Jacobites have become Uniat (see below, § 6). Jesuit missionaries first came to Mesopotamia in 1540. In 1646 the Uniat patriarchate was fixed at Aleppo, and the patriarch took his title from that place. The Syrian Christians in that neighbourhood mostly belong to that jurisdiction.

6. Melkites and Uniats.—The former name, which is derived from Syr. *malkā* ('king'), a word used also, like *βασιλεύς*, for an emperor, was invented in the 10th cent. by the Jacobites for those Christians who adhered to the Council of Chalcedon. It was a nickname, meaning 'royalists,' and implying that they could stand only by the support of the Roman emperor. It may be compared with the nickname 'Erastians' used in this country at the present day; both have a somewhat similar shade of meaning. But the name 'Melkites' was quite readily accepted by those to whom it had been given in derision,[1] and was applied to all those who were in communion with Constantinople, whether Syrian, Egyptian, or Greek. In comparatively recent times the name has been given, and given exclusively, to the Christians of Syria and Egypt who have been drawn from the Orthodox Eastern Church and have been united to Rome. Such, *e.g.*, are the 'Syrian Melkites,' whose liturgical language is, or was, Syriac.

The name 'Uniat' is applied to those Eastern Christians who have been united to Rome, but are allowed to keep their own liturgies, liturgical language, and ecclesiastical customs, especially as to the marriage of their clergy—though in all these respects modifications, sometimes very considerable, have been introduced. The earliest of these 'Uniats' are the Maronites (see below, § 7); but there are also four Uniat Churches of the Græco-Slavonic rite—the Bulgarian, Greek Melkite (formed of Arabic-speaking Orthodox after the Synod of Bethlehem, in 1672), Rumaic or Roumanian, and Ruthenian; there are also the Armenian Uniats; the Syrian Uniats, drawn from the Jacobites in 1646 (see above, § 5); the Chaldæan Uniats, drawn from the Nestorians (see below, § 8); and the Malabar Uniats (see below, § 9). The Uniats have nine Eastern patriarchs. Those of Constantinople, Alexandria, and Antioch live in Rome. In addition there are Uniat patriarchs of Jerusalem (Greek), Antioch (Maronite), Antioch (Greek), Antioch (Syrian), Cilicia (Armenian), Babylon (Chaldæan).[2] European readers are often confused by the fact that there are no fewer than six patriarchs who take their title from Antioch—one Greek Orthodox, four Uniats, and one Jacobite.

The Syrian Uniats use the liturgy of 'St. James'; the rubrics are often in Carshuni (Arabic in Syriac characters), the audible prayers both in Syriac and in Carshuni, the inaudible in Syriac only.[3] The Chaldæan Uniats use the liturgy of 'Addai and Mari' with some amendments; their daily services are considerably abbreviated compared with those of the Nestorians, and in the case of the long festal Night Service about six-sevenths are omitted.[4]

7. Maronites.—These Syrian Christians of the Lebanon derive their name from their teacher John Maro, or Maron, a learned monk, who was named patriarch of Antioch, perhaps early in the 8th century. He has often been confused with an earlier Maron, called by Gibbon[5] 'a saint or savage of the fifth century,' whose relics were greatly venerated. In the time of John Maron the Monothelete controversy was still going on, and these Lebanon Christians espoused that cause.[6] They were thus in opposition to their Christian neighbours, and later, as Christians, to the Muhammadan authorities; and they received the nickname 'Mardaites' or 'Rebels' (Syr. *marīdhē*).

In 1182 they renounced Monotheletism under the influence of their patriarch Aimeric, and were united with Rome, then numbering about 40,000 souls.[7] At that time the connexion with the West

[1] But the ancient and authoritative Jacobite statement of faith (the 'Creed of our Sainted Fathers'), published by the Syrian Patriarchate Education Committee in English (*The Ancient Syrian Church in Mesopotamia*, London, 1908), emphatically states that the Trisagion with this addition is addressed to 'the Only-begotten Son,' and not to 'the Three blessed Persons' (p. 10). This 'Statement of faith' is quite free from Monophysitism. It denies that the divine nature of our Lord was commingled with the human nature, or that the two natures became commixed and changed so as to give rise to a third nature, and asserts that the two natures became united in indissoluble union without confusion, mixture, or transmutation, and that they remained two natures in an unalterable unity.

was through the Latin kingdom of Jerusalem. After the destruction of that kingdom in the 14th cent. relations with Rome were at times broken off, but they were resumed, and still continue. In the year 1584 Pope Gregory XIII. founded a college in Rome for training their clergy, and this institution has the honour of having in the 18th cent. educated the learned brothers J. S. and J. A. Assemani, to whose literary labours scholars are so much indebted for their knowledge of Syriac Christianity. The Maronites subscribed the decrees of the Council of Trent in 1736.

They are allowed to retain their own liturgical customs, and use the Syriac 'St. James' and other anaphoras.[1] The rubrics in the printed books are in Carshuni; some of the formulæ are in Carshuni and Syriac.[2]

The Maronite clergy may marry. They also elect their own patriarch, who still takes his title from Antioch. He lives at the monastery of Qānōbīn (*κοινόβιον*), in the Lebanon, and has under his jurisdiction bishops at Aleppo, Tripoli (in Syria), Byblus and Botra, Baalbek or Heliopolis, Damascus, Berytus, Tyre and Sidon, and in Cyprus.[3] Their numbers are difficult to estimate. Gibbon[4] gives 150 priests and 100,000 souls, but they probably number about a quarter of a million.

They have suffered much from their feuds with their neighbours, the Druses, and in the year 1860, after great massacres of the Maronites, the British and French governments intervened for their protection.

8. East Syrians, or Nestorians.—We may now take up the history of the Church in the Persian empire from the middle of the 5th century.[5] The first great event for the East Syrians after the Council of Ephesus, A.D. 431, was their final expulsion by the emperor Zeno from the school of Edessa and the consequent founding of the school of Nisibis, A.D. 489. Ibas (Syr. Ihibha, pron. īhīwā, lit. 'given'), bishop of Edessa, who was strongly Dyophysite, had been condemned by the Latrocinium, or 'Robber Synod,' of Ephesus in 449, but was acquitted and restored to his see by the Council of Chalcedon two years later, after having anathematized both Nestorius and Eutyches. During his lifetime the Monophysites made no way at Edessa, but after his death in 457 they became predominant there, and after a long struggle expelled their opponents. This was a decisive event in the Persian Church. Although up to that time it had had no direct dealings with Nestorianism, its tendency was mainly Dyophysite, and the influx of Nestorians from the Roman empire greatly strengthened that tendency. Nevertheless it is a mistake to suppose that the Persian Church at some definite date in the 5th cent. espoused Nestorianism and was therefore cut off from the Catholic Church. The process was a gradual one. The principal influence in the latter half of the 5th cent. was that of Bar Ṣōmā (Barsumas, lit. 'son of the fast'), bishop of Nisibis, who had taught at Edessa, and now, in the vacancy of the catholicate, organized the East Syrian Church in a Nestorian sense; he must not be confused with his namesake of the Latrocinium, who was a Monophysite. There was some opposition to 'Nestorian' doctrine, especially from the monks of Mar Mattai (see above, § 5), who to this day are Jacobites. The catholicos Acacius (Syr. Aqaq), who was bishop of Seleucia-Ctesiphon from 485 to 496, went to Constantinople on a mission from the Persian king, and there declared that his Church knew nothing of Nestorius; he was admitted to communion by the Orthodox, having anathematized Bar Ṣōmā.[1] We may perhaps discount his statement as an Oriental exaggeration; but the incident shows that the separation was not yet complete. Still later, good relations with Constantinople took place in the time of Mar Abha (pron. Awā) the Great, a contemporary of Jacob Baradai (see above, § 5). This prelate, a convert from Magianism, was catholicos from 540 to 552, having been a teacher at Nisibis, and having visited Jerusalem, Egypt, Greece, and Constantinople in the time of Justinian. In his Catholicate, as it would seem, the Council of Chalcedon was accepted by the East Syrian Church.[2] The *Sūnhādhūs*[3] quotes with approval one of its canons, and dates the council as '25th October, 763 of Alexander,' *i.e.* A.D. 452 (*sic*); the session of that day was particularly solemn, and was attended by the emperor and empress: it ended the principal work of the council.[4]

One of the first matters discussed in this period was the marriage of bishops and clergy. A council was held in 484 at Beith Laphat (also called Gondisapor, perhaps the modern Shiraz); it allowed them to marry, and even permitted a second marriage to clerical widowers. This was confirmed in a council held by Acacius in the following year. Several patriarchs were married: Babhai (pron. Bā-wai), catholicos from 496 to 505, his successor Silas, Elisha, Paul, and Ezekiel, all of the 6th century.[5] But Mar Abha set his face against episcopal marriage, himself declining to marry; and after his time it became rare. The present rule is that a bishop must be a *rabban* ('monk,' but see below), and may not marry or have married, and must never have eaten flesh-meat; nor must his mother have eaten meat during her pregnancy.[6] There is evidence that the rule against eating meat did not hold in the 7th century.[7] It is noteworthy that Ebedjesus (see below) in his *Sūnhādhūs* passes over the question of episcopal marriage in silence, and does not refer to the decrees which permitted it.[8]

The definite official adoption of Nestorianism, or of what was taken for such, must be dated at the beginning of the 7th cent., when the East Syrians formally repudiated the term 'Theotokos' and adopted the phrase 'two *qnomé*, one *parṣopa* (*πρόσωπον*), two natures' with reference to our Lord.[9] The opposition to the 'Nestorians' of the Monophysite minority in Persia was greatly strengthened by the influx of a large number of captives of the latter persuasion from Syria, in 540 and 573, under Chosroes I.; the influence of Shīrīn, the Christian queen of Chosroes II. (590–628), was latterly in their favour.[10]

Monasticism was at one time a most flourishing institution among the East Syrians. Thomas of Marga (see below) gives us a graphic description of his own monastery, and we have other sources of information in Sozomen,[11] in P. Bedjan's *Acta Martyrum et Sanctorum*, and elsewhere.[12] It seems to have been introduced into the East from Egypt by Mar Awgin (pron. Ōgīn; = 'Eugenius,' † 363 ?), who founded the famous monasteries of Mount Izla (near Nisibis) and Deir-el-Za'afaran (near Mardin; see above, § 5). He is said to have been the teacher of James of Nisibis. His *Life* is included in

Bedjan's work, but it is remarkable that Thomas of Marga does not mention him. The great organizer of monasticism among the East Syrians was a later monk, Abraham of Kashkar, a town between the lower Euphrates and the Tigris. Abraham refounded Mount Izla in the 6th cent., and his canons, which are still extant,[1] are included in the Nestorian *Sūnhādhūs*.[2] His successor as abbot, Dadhishu, made canons accepting the doctrines of Diodorus, Theodore, and Nestorius.[3] The rules as to jurisdiction of monasteries were the same as among the Jacobites (see above, § 5); in the 'patriarchal' monasteries the diocesan bishop might not officiate nor be mentioned in the litany.[4] One of the most famous of the monasteries was that of Beith 'Abhé (pron. 'Awé), probably founded by **Jacob of Lāshūm**, a monk of Mount Izla, in the 6th cent.; its situation is uncertain, but probably it was near the Great Zab.[5] This monastery produced from the 7th to the 9th centuries many patriarchs, as well as its famous historian, Thomas of Marga. The monastery of Rabban Hormuzd, about 30 miles north of Moṣul, is close to the village of Alqosh (Elkosh), where the tomb of the prophet Nahum, in a Jewish synagogue, is still shown. The monastery was founded by **Hormuzd of Beith Laphaṭ**, *c.* 600. He spent the last 22 years of his life there and was buried within it, as were several patriarchs.[6] The number of monks had dwindled from fifty in 1820 to about ten in 1890,[7] a new monastery having been built at the foot of the hills, not far away. When the present writer visited the two monasteries in 1887, there was in the new one a large number of monks, busily engaged. Both the monasteries now belong to the Uniat Chaldæans (see above, § 6). There were also many other monasteries elsewhere.[8]

Monasteries are now quite obsolete among the Nestorians, though a few *rabbans* (monks) live in the world under a private rule, neither marrying nor eating meat, such as the late well-known Rabban Yonan (Jonah) of Qūchānīs.[9]

Among a large number of Nestorian writers the following may be mentioned. Narsai († *c.* 502), a poet and homilist, called 'the Harp of the Spirit,' went to Nisibis from Edessa on the expulsion of the Nestorians. Ebedjesus says that he wrote 360 homilies; of these 47 have been published in Syriac by A. Mingana, and those on the eucharist and baptism, translated into English by R. H. Connolly, are of the greatest importance for the history of the early East Syrian rite. Mshiha Zkha was the writer of a most valuable history in the 6th century (see above, § 3). Ishu'yahbh III. (pron. Ishūyāw), who was catholicos for ten years from 650, was the reputed author or reviser of the ordination and baptismal services, and also of the Ḥudhra (see below).[10] In the earlier Syrian rite of baptism, as evidenced by Narsai, the *Syriac Didascalia*, and some other Syriac descriptions, the anointing seems to have been only before baptism; the post-baptismal anointing was added among the Jacobites in the 5th cent., probably by Severus (see § 5), and among the Nestorians by Ishu'yahbh.[11] Thomas of Marga, bishop in the 9th cent. of that city (on the Zab) and metropolitan of Beith Garmai (east of the Tigris), was a monk of Beith 'Abhé (see above); his *Book of Governors*, a monastic history, is most valuable as filling a gap of 300 years in the history, otherwise hardly known. George of Arbela, metropolitan of Moṣul and Arbela (south-east of Moṣul) in the 10th cent., wrote a commentary on the services of the Church, which is valuable for the history of the Nestorian liturgies.[12] Mari Ibn Suleiman ('son of Solomon') was a chronicler of the 12th century. Ebedjesus (E. Syr. 'Abhdishu, pron. 'Ōdīshū, lit. 'servant of Jesus'), metropolitan of Ṣubha (pron. Ṣūwā), by some identified with Nisibis,[13] in the 13th cent. compiled the *Sūnhādhūs*, or 'Book of Canon Law,' now in constant use by the Nestorians, though many of its provisions have become obsolete.[1]

The missions of the East Syrians have been far extended. Their work in India is attested in the 6th cent. by Cosmas Indicopleustes (see below, § 9). Gibbon remarks[2] that 'the barbaric churches, from the Gulf of Persia to the Caspian Sea, were almost infinite.' The missionaries extended their labours to Socotra, Ceylon, Turkestan, and even to China, where the Nestorian monument of Si-ngan-fu, dated A.D. 781 ('1092 of the Greeks'), attests their activity, which also gave rise to the legend of Prester John (*q.v.*), a supposed priest-king in Tartary. Wherever they carried their teaching, they used Syriac as their liturgical language, even though it was not that of the people.[3] Thus the Malabarese have always used Syriac liturgies. This great activity swelled the numbers of Syrian Christians exceedingly, and the Nestorians and Jacobites together are said to have been more numerous than the Greeks and Latins together.[4]

Under Muhammadan rule East Syrian Christianity was alternately favoured and persecuted. Under Tamerlane ('Timur the Lame') in the 14th cent. it was almost annihilated. But a remnant survived and is still to be found in the mountains of Kurdistan in E. Turkey, in the upland plains of Azarbaijan in the north-west of the present Persian kingdom, especially in that of Urmi or Urumi (often called in Europe Urmia), and in the low-lying plain of Moṣul (Nineveh). The patriarch, who after the foundation of Baghdād (A.D. 762) had left Seleucia-Ctesiphon for that city, later removed to the north. But disputes as to the succession divided the patriarchate. The Nestorians themselves are now under the rule of Mār Shimūn (these two words are pronounced as one and are accented on the first and last syllables), who lives at Qūchānīs in the almost inaccessible mountains which surround the Great Zab, a beautiful retreat near the small town of Julamerk. Each successive catholicos takes the name 'Shimūn' (Simon), whatever his baptismal name. The East Syrians of the Moṣul plain, now called Chaldæans, have been united with Rome since 1680, when they were received by Pope Innocent XI. Their head ('patriarch of Babylon') bears the name Mār Eliyā (Elijah). He has several bishops, each styled metropolitan, under him. He retains the title ('of Babylon') which the Nestorian patriarchs often used when they lived at Seleucia-Ctesiphon; it is also found in the *Sūnhādhūs*.[5] There were at one time patriarchs at Amida (Diarbekr), who also were united with Rome; these bore the name Mar Joseph.

All the East Syrians speak Syriac vernacularly, though many of those in the Moṣul plain speak Arabic also. It is common to hear the sailors on the Tigris steamers talking vernacular Syriac, these being Chaldæan Uniats. The total number of Nestorians and Uniats combined is, or was till lately, perhaps about 300,000.

A detailed account of the ecclesiastical hierarchy of the Nestorians is given in Maclean-Browne, *The Catholicos of the East*, ch. ix. The patriarch, or catholicos, has under him a *maṭrān*, or metropolitan, who bears the dynastic name of Mār Ḥnān-īshū ('mercy of Jesus'), and several bishops, the number varying considerably from time to time. The present method of filling bishoprics (including the patriarchate) is for each bishop to bring up one or two boys or young men, his nephews or near relatives, as potential successors. Such a one is called in the vernacular *nāṭar kūrsī* ('keeper of the seat'), and is not allowed to eat meat or marry; the bishop ordinarily nominates the one

whom he wishes to succeed, but in theory the people elect from among the 'keepers of the seat.' In the 15th cent. the catholicos made a law restricting the catholicate to members of his own family. This was an innovation, though perhaps not a very recent one. The catholicos consecrates the bishops; but the metropolitan consecrates the catholicos.[1]

In most villages there is at least one priest, in some several; and deacons are very numerous, as the eucharist cannot be celebrated without the assistance of a deacon or of a priest acting as deacon. Occasionally a priest is made an archdeacon (*arkān*), but this is now only an honour, not involving special duties. Formerly there were chorepiscopi and periodeutæ ('visitors'); these were presbyters, not bishops. The office of periodeuta is at least as old in Syrian Christianity as Rabbūlā (6th cent.), as he mentions it in his canons.[2] The East Syrian *Book of Heavenly Intelligences*[3] enumerates nine orders in three divisions; (1) the episcopate: patriarch (or catholicos), metropolitan, bishop; (2) the presbyterate: chorepiscopus, periodeuta (or archdeacon), presbyter; (3) the diaconate: deacon, subdeacon, reader. These are said to correspond to the angelic hierarchy (as given by pseudo-Dionysius Areopagita and others) of (1) cherubim, seraphim, thrones; (2) dominions, virtues, powers; (3) principalities, archangels, angels. Minor orders are now obsolete. There are no longer any deaconesses.

Many of the ecclesiastical customs of the Nestorians are those also of the Jacobites (see above, § 5). But there are some differences. The Nestorian priests and deacons may marry, and if their wives die they may marry again; but the parish priests are not obliged to be married, though as a matter of fact they are hardly ever single men. The churches, which (especially in the mountains of Kurdistan) have exceedingly narrow and low doors, sometimes only accessible by a ladder, and which are often built for security in a cleft of a rock or in some almost inaccessible place, are nearly all of the same pattern. Outwardly they show no sign of Christianity save a small cross beside the church door. They have no towers or spires, such as the Armenian churches have. Internally they have a stone wall reaching to the roof and dividing the nave from the sanctuary; a doorway in this wall is covered with a veil which is drawn back at certain parts of the service. On the nave-side of this wall is a raised pace called *bema* (a name which in other Eastern communions means the sanctuary), and this again is bounded by a dwarf wall with apertures in the middle and at the side, where the clergy stand to communicate the people. This raised pace somewhat corresponds to the Greek *σωλέας*.[4] Against the dwarf wall, towards the nave, are projections (said to contain relics) for the cross and for books. The altar is attached to the east wall, and is usually built into a recess therein. It is oblong, not square as among the Greeks. The people stand in the nave to worship, the men in front, and the women behind; there are no seats, and if there is any occasion for sitting, such as a sermon, the people sit on the matted floor. Two other features of the churches may be noticed: a baptistery (also used as a vestry, and usually for baking the eucharistic bread), at the south-east corner of the church next the sanctuary; and a court (often open to the air) on the south side of the nave, where the daily prayers are said in summer. This is the usual arrangement, and is that of the church of Mart Mariam (St. Mary) at Urmi in Persia, which claims to be the oldest church in the world, and to contain the tomb of one of the Wise Men of Bethlehem, built (as the most ancient tombs are) into the wall of this church—in this case at the south-east corner of the nave.[5] The people are called to worship by a wooden board (Syr. *nāqūshā*) hit by a mallet; this is the Greek *σήμαντρον*.[6] Bells are seldom used to summon to prayer, though there are often strings of small bells hung inside the church.

The vestments worn at the eucharist differ somewhat from those of the Jacobites. For a chasuble the Nestorians wear a kind of cope (*ma'āprā*), which has no fastening at the neck, and is very difficult to keep in position. The priests' stoles, like those of the West, do not differ in shape from those of the deacons; maniples and amices are not worn. Private confession, though often referred to in the service-books, is now obsolete. The fasts are the same as those of the Jacobites, but the fasts of the Apostles and of Mary are almost if not quite obsolete, as are some others mentioned in the East Syrian books. The Wednesday and Friday fasts do not in practice begin on (what we call) the evening before, but they end at sunset; all Eastern Christians reckon the day as beginning and ending at sunset, and our 'Sunday evening' is their 'Monday evening.'

The chief liturgy used by the Nestorians is that of 'the apostles Addai and Mari.' This liturgy has many early features, especially a form of eucharistic invocation of the Holy Spirit which is not as fully developed as that in most of the Great Liturgies. It prays that the Holy Ghost may come and rest on the oblation, and bless and sanctify it, that it may become (or be) for us for the remission of sins, etc.; and it does not explicitly mention the change in the elements. But the most curious feature is the absence of the words of our Lord spoken at the Last Supper, when after 'blessing' or 'giving thanks' He gave the sacrament to the disciples ('This is my body,' etc.). Neale[1] argues on *a priori* grounds that 'Addai and Mari' must have originally had these words. But this is a precarious statement; there are other instances of at least the partial omission of the words.[2] This liturgy in no way refers to the Nestorian controversy. On certain days of the year the anaphora of 'Addai and Mari' is not used, but that of 'Theodore the Interpreter' (of Mopsuestia) or that of 'Nestorius' is substituted, the first part of the liturgy, and the ending, being common to all three. All these anaphoras date, in some form, from very early times; the first probably, in its earliest shape, was compiled before A.D. 431; the other two are certainly not the work of the bishops after whom they are named, but are the work of East Syrian authors. The author of 'Nestorius' must have had a Byzantine liturgy before him, as many traces of that rite are found in it. But all three anaphoras are quite distinctly of the East Syrian, not of the Byzantine, family of liturgies. All three seem to have been composed before Narsai (end of 5th cent.), though doubtless many more modern additions have been made to them.

Eucharists do not occur very often among the Nestorians—some five or six times a year as a rule, though in a few churches weekly eucharists are the custom. The people communicate, as they pray, standing, the mothers holding up the very little children in their arms to receive. All receive in both kinds separately (the species of bread in their hands), except the very little ones, for whom the celebrant dips a small portion of the consecrated bread in the chalice and then puts it in their mouth. Reservation for the sick is not allowed. The eucharistic bread is leavened.[3] All services, without exception, are sung; but no instrumental music is allowed.

The baptismal customs do not differ greatly from those of the Jacobites.[4] The service is closely modelled on the eucharistic liturgies, than which

[1] *Gen. Introd.* i. 486.

[3] For a curious tradition as to the handing down of the leaven see Maclean-Browne, p. 247.
[4] For a description see Maclean-Browne, p. 267 ff.

it is certainly later. There is, however, no kiss of peace. The triple immersion is absolutely total. As with all Easterns, the presbyter confirms, and lays his right hand on or over the neophytes; the use of the consecrated oil at this point is not explicitly mentioned in the service-book, but it is customary for the priest, when signing the neophytes with the sign of the cross, to do so with his thumb which he has dipped in the oil. There are now no interrogations or renunciations,[1] though they are alluded to in the 5th cent. by Narsai, where the renunciations have special reference to heresy.[2] Private baptism is not, in practice, allowed; if a village has no church, a child must be carried to another village which has one. Thus some children die unbaptized, though it is not likely that a person would grow up without baptism. Sponsors are considered as being akin to their godchildren, and the relationship is a bar to marriage.

The non-liturgical services are of great interest, and are extremely long, at least in theory. They consist mainly of hymns and anthems.[3] The great number of martyrs in the East Syrian Church is reflected in the frequent mention of them by name in these anthems. The calendar is remarkable, and in some respects unique. Most of the saints' days fall on a Friday, and suit very well with the arrangement of the ecclesiastical year, which is divided into periods of about seven weeks each, more or less—Advent, Epiphany, Lent, Easter, 'The Apostles' (after Pentecost), 'Summer,' 'Elijah,' 'Moses,' and the 'Hallowing of the Church.' A few of the holy days, however, fall on fixed days of the month, as Christmas (Dec. 25), Epiphany (Jan. 6), St. George (April 24, etc.), St. Cyriac and St. Julitta (July 15 and Dec. 22), St. Peter and St. Paul (July 29), St. Mary (Aug. 15), Holy Cross Day (Sept. 13, not 14 as elsewhere). The twelve apostles are commemorated together on a Friday before Lent, the four evangelists on another, the 'Greek doctors' (Diodorus, Theodore, Nestorius) on a third, the 'Syrian doctors' (especially Ephraim, Narsai, Abraham [of Kashkar?, see above]) on a fourth. On other Fridays are commemorated St. James the Lord's brother, St. Mary, St. John Baptist, St. Peter and St. Paul (a second commemoration), Mar Abha or else the patron saint of the church, St. Stephen, the forty martyrs of Sebaste, all the departed, the Seventy, and some others.

The choirs are divided into two parts, and according as the first or the second choir begins the anthems the week is called 'Before' or 'After,' 'Before and After' (Syr. *Qdhām ū-Wāthar*) being thus taken for the name of the ordinary book of daily services. The *propria* for Sundays, fasts, and festivals are of very great length, and are contained in the books called *Ḥūdhrā* ('cycle') and *Gazzā* ('treasure'), two enormous MS volumes, and some others. These two are not published; but the complete East Syrian service for the Epiphany is given in English in Conybeare-Maclean, *Rituale Armenorum*, p. 288 ff. (from a MS in the Library of the Propaganda Fide in Rome), with the cues all filled in, and a part of these two books is published in Syriac in the *Breviarium Chaldaicum*. The Psalms are said (at least in theory) all through twice a week, and the whole Psalter is recited on festivals of our Lord. In the litanies, which are numerous, and one at least of which is said at almost every service, the ruling patriarch, metropolitan, and bishop of the diocese are commemorated by name. The marriage-service and the burial-service for laymen (*'anīdhā*) have been published in Syriac.[1] The burial-service for the clergy (*kūrastā*) is much longer and more elaborate than that for laymen. These burial-services are most dramatic, and consist partly of dialogues between the departed and the mourners, or between the departed and those already in Sheol. After the funeral the kiss of peace is given, at least in the case of priests and bishops. All pass in line and kiss the hand of the departed, or a cross laid on his breast, and so take leave of him.[2] Badger gives an English translation of the baptismal-, marriage-, and ordination-services, and of the burial-service for priests.[3]

9. Christians of Malabar, or of St. Thomas.—Ancient tradition, in which, however, we can have little confidence, makes St. Thomas the apostle the first teacher of Christianity in India. The legend is told in the Syriac *Acts of Judas Thomas* (see above, § 4), which, curiously enough, makes Thomas (lit. 'twin') the twin-brother of our Lord. J. R. Harris sees here traces of the influence of the Heavenly Twins on Christian legend.[4] The Ethiopic legend of St. Thomas[5] is still fuller. Our Lord divides the world into twelve portions, and Thomas's lot is to go to India. Very unwillingly, but encouraged by our Lord, he goes, guided by Peter and accompanied by Matthias. Jesus appears in the form of a rich man, who sells Thomas as a slave, the price to be given to the poor and needy. Peter and Matthias return. Thomas is set to work as a stonemason, carpenter, and physician; but he afterwards explains that the buildings which he undertook to build were the souls which he won to Christ. He appoints a bishop, priests, and deacons, and departs in a cloud, having been miraculously clothed again in the skin which had been flayed off him. According to another account,[6] he was pierced by soldiers' spears and died. The opposition is said to have been largely due to his preaching encratism,[7] and persuading wives to forsake their husbands. The *Acts of Judas Thomas* says that the relics of the apostle were transferred to Edessa (A.D. 232?). It has been suggested by some that the name 'Christians of St. Thomas' comes from another Thomas than the apostle. This later namesake, **Thomas Cannaneo**, is variously assigned to the 4th or the 9th century.[8] Another legend connects Pantænus of Alexandria (*c.* A.D. 200) with India, where, it says, the apostle Bartholomew had already preached.[9] Pantænus is said by these writers to have found there a copy, in the Hebrew language, of St. Matthew's Gospel, and to have left it behind him.

The first certain historical testimony to the existence of Christians in India is that of the Alexandrian merchant who afterwards became a monk, and whom we know from his Indian travels as **Cosmas Indicopleustes**. He travelled far, and his *Christian Topography of the Whole World* in twelve books, still extant, is a valuable historical piece of evidence, though it is marred by the erroneous geographical conceptions of the day. The first six books may be dated *c.* A.D. 547, the rest *c.* 560. Cosmas's other works are not now extant. He travelled in India and Ceylon, and describes 'Mali' (identified with Malabar) on the Indian coast, the centre of the pepper trade. He

testifies to a large number of Christian churches on the coast of India and in Ceylon and Socotra, whose clergy, he says, were ordained by the Persian archbishop of Seleucia, and were subject to his jurisdiction; the Church there had had many martyrs and a large number of monks. Thus we may gather that the 'Christians of St. Thomas' are the fruits of the missionary activities of the Church of the Persian empire (see above, § 8), and that their Christianity had begun long before Cosmas's time, probably in the 4th century.

The subsequent history is somewhat obscure. Immigrations of Christians to Malabar from Baghdād and elsewhere occurred twice in the 8th and 9th centuries, and the immigrants intermarried with the native Christians. The later of these movements was under two Nestorian priests (bishops?), **Mar Sapor** and **Mar Peruz**. The fame of the Malabar Christianity spread to the West, and King Alfred of England sent ambassadors to that country.[1] The converts were protected by the king of Cochin. They had their bishop at Angamala, and he was styled 'Metropolitan of India,' having in his jurisdiction 1400 churches and 200,000 souls in the whole district.[2]

A theory has lately been put forward by P. T. Geevergese, a native Malabar Syrian, in a tract entitled *Were the Syrian Christians Nestorians?*, to the effect that the Malabarese were Jacobites till the 15th cent., when they became Nestorians for a hundred years. It is agreed that their Church was originally founded from Seleucia-Ctesiphon, and that they were under the Catholicos of the East in the pre-Nestorian period; but this writer maintains that thereafter they depended on the Jacobites, not on the Nestorians. The only argument of any importance adduced in favour of this theory is the existence of two inscriptions at Kottayam, a town of Travancore, in Pahlavi, the official language of the Persian empire during the Sasanian dynasty; they are said to be of the 7th or 8th century. One of the inscriptions has a line also in Syriac, in Estrangéla characters, perhaps of the 10th century. The two run thus: (*a*) 'In punishment by the cross (was) the suffering of this One, He who is the true Christ, and God above, and Guide ever pure'; (*b*) ['Let me not glory save in the cross of our Lord Jesus Christ] who is the true Messiah and God above and Holy Ghost.' The words in square brackets are in Syriac. Geevergese amends 'Holy Ghost' to 'Guide ever pure' as in the former inscription. These are said to be anti-Nestorian. But is this the case? The 'Nestorians' of the Persian empire never failed to assert that He who died upon the cross was God. The existence in Malabar of an old Jacobite Bible of the 12th cent. or earlier proves nothing in the absence of evidence as to when it was brought there. The suggestion that the Portuguese inquisitors found some liturgical practices existing which showed traces of Jacobite rather than Nestorian influence, though *ex hypothesi* the latter had been predominant for over a hundred years, will hardly bear examination. Thus the inquisitors mention a liturgy 'of Diodorus' as being in use. There is no such known Nestorian liturgy. Therefore, it is maintained, the liturgy in use was non-Nestorian, *i.e.* Jacobite. It would indeed have been remarkable if the Jacobites had named one of their liturgies after the real father of Nestorianism. Renaudot[3] supposes that 'Diodorus' is here a mistake for 'Theodorus,' but, as the Synod of Diamper mentions both Diodore and Theodore, this is very unlikely.[4] Geevergese agrees that the Nestorians of the Tigris valley at the end of the 15th cent. and the beginning of the 16th sent bishops to Malabar, on the request of deputies who had come thence, and he maintains that these converted Malabar from Jacobitism to Nestorianism. It does not appear to the present writer that Geevergese has proved his theory; but there is possibly this amount of truth in it, that certain of the Malabarese Christians, who have unfortunately always been conspicuous for quarrelsomeness (like their spiritual ancestors), may have had dealings with the dissentient Jacobites of the Tigris valley, or with the Western Jacobites, before the 15th century. Thus a deputation is said to have gone to the Monophysites of Alexandria to ask for a bishop for 'India' (Malabar?), A.D. 695.[5]

An ecclesiastical revolution was effected by the Portuguese in the 16th century. They established the Inquisition at Goa in 1560. The Synod of Diamper, in the south of Cochin, held in 1599 under **Alexius de Menezes**, archbishop of Goa, united the Malabarese, then estimated at about 200,000 souls,[6] to Rome, and rooted out all traces of Nestorianism. Celibacy of the clergy was enforced, and made retrospective. All old books and liturgies were destroyed, or radically altered, so that probably there does not now exist a single complete copy of the liturgies as used before the synod. Renaudot remarks[1] that the Portuguese censors incautiously condemned things which had nothing to do with Nestorianism. The liturgy which they found to be principally used was closely related to, or practically the same as, the Nestorian 'Addai and Mari' (see above, § 8). An English translation of this[2] is published by J. M. Neale,[3] who says[4] that it is given as revised by Menezes and the Synod of Diamper. Yet this cannot be altogether the case, as it contains the names of Nestorius, Diodore, and Theodore, as well as of Ephraim, Abraham, and Narsai (see above, § 8), and the phrase 'Mother of Christ' for 'Mother of God' (see below). Neale gives some of the prayers in what was probably the original order, but indicates by numbers the order in the form approved at Diamper.

The change from ancient customs was effected only after great opposition on the part of the Malabarese themselves, who rallied under their bishop, **Mar Abraham** († 1597). It was his death that made the Synod of Diamper and the real union with Rome possible.[5]

It is interesting to notice the changes of custom and of liturgy effected at Diamper. Up to this time the Malabar Christians had had but a single bishop at a time; hence, perhaps, arose the custom for the chrism at confirmation to be consecrated by a priest (*catanar*) rather than, as elsewhere in the East, by a bishop; indeed, the Malabarese were accused of not having had confirmation at all,[6] though this is clearly a mistake. The chief changes in the eucharistic liturgy made at Diamper were the following. The pope's name was substituted for that of the patriarch of Babylon. For the names of Nestorius, Diodore, Theodore, and other 'Nestorian' fathers, those of Cyril (of Alexandria) and others were substituted. The phrase 'Mother of God' replaced 'Mother of Christ.' Where, before the consecration, the words 'the body,' 'the blood,' occurred (as often in Eastern liturgies by anticipation), the words 'bread,' 'wine,' were substituted. In the 'Nicene' creed the phrases 'God of God, Light of light, very God of very God,' which were said to have been wanting in the Malabar form, were inserted; probably what is meant is that the first two of these phrases were wanting in Malabar, as they do not occur in the Nestorian creed (see above, § 3). The phrase 'consubstantial with the Father' was substituted for 'Son of the essence of the Father,' the usual equivalent in Syriac (Neale unfortunately does not give the text of the creed in his Malabar liturgy). The host was ordered to be elevated at the consecration. But the chief change was a reversal of prevalent Oriental conceptions of liturgy. The epiclesis, or invocation of the Holy Ghost, was moved from its place after the narrative of the Last Supper and placed before it,[7] the wording being altered so as to make the epiclesis refer only to a good reception of the sacrament. For these changes see Howard, p. 40; but two of his statements appear to be doubtful. The Portuguese censors probably found no narrative of our Lord's words at all, as they were working on 'Addai and Mari' (see above, § 8); they probably therefore inserted them from one of the other anaphoras, though not in the place where

[7] For a double invocation in the Egyptian rite, one before and one after the narrative of the Last Supper, see art. INVOCATION (Liturgical), § 6.

they are found in those anaphoras, but in the place which they thought most suitable. The other statement, that the Portuguese altered the wording of the epiclesis, is also doubtful, for, as Neale gives it,[1] it agrees exactly with the epiclesis of 'Addai and Mari,' which, as we have seen, is of a somewhat early type, throwing most of the emphasis on the effects and purpose of the consecration, for the benefit of the communicants, rather than on the change effected in the bread and wine. The history of the changes at Diamper fully justifies Renaudot's dictum quoted above, and shows that the Portuguese censors were quite ignorant of liturgical science.

The Portuguese changed the episcopal see from Angamala to Cranganor on the coast, so that it might be more accessible to them, and that they might have a greater hold on the native Church. But during the whole time of their rule in India they aroused constant opposition from the Malabarese, whom the terrors of the Inquisition were never able entirely to subdue.

In 1663, after more than 60 years of Portuguese rule, the Malabarese were enabled by the Dutch conquests in India once more to assert their independence, induced thereto by the murder of Theodore, a bishop sent from 'Babylon.' The Dutch expelled the Jesuits from Malabar soon after 1663. But the Malabarese were not united among themselves, and about half remained in obedience to the Roman see, while the rest became independent of it. These last gladly accepted Gregorius, Monophysite bishop of Jerusalem, who came from the Jacobite patriarch at Mardin in 1665. Gregorius consecrated Thomas as metropolitan, and since then the Malabarese have been in the main Jacobite. This change of front appears remarkable at first sight. Yet we must remember that in their origin neither the Malabar Church nor her mother, the East Syrian Church, was Nestorian, for they both existed before Nestorianism was propounded. And, though many East Syrians were genuinely Nestorian, it is very doubtful if their Church was consistently and officially so; still less certain is it that the Malabarese were strongly imbued with that doctrine. Hence we can understand why they grasped at the first hand that was stretched out to help them in getting rid of the Western authority which was imposed on them, but under which they had never rested content.

In the year 1700 and afterwards Nestorian bishops were sent, but they only secured the allegiance of a minority. In the 19th cent. the history is one of constant litigation between rival parties. The Nestorians of Malabar, after many lawsuits, won recognition in the courts and part of the endowments. In the year 1850 they obtained a bishop from Mar Shimun, the Nestorian catholicos (see above, § 8). Later, another was sent, but he was murdered by robbers on the journey. In 1907 Mar Shimun consecrated Mar Timotheus (Abimelech), who now holds office.[2]

There are now perhaps 300,000 Syrian Christians, all told, in India; the majority are Jacobites, and have since the 17th cent. adopted the Jacobite liturgies and customs.[3] The metropolitan usually consecrates his own successor, from the family in which the archidiaconate has been hereditary. The archdeacon is called *ramban*. The eucharist is only rarely celebrated; the laity must communicate at least three times in the year,[4] but there are often eucharists without lay communicants. The churches are plain, consisting of nave and chancel without transepts.[1] There is one altar, the so-called 'side altars' being used only, as in the Nestorian churches, for holding a cross, or books, or the like. The altar itself is 4 ft. high by 6 ft. long and 3½ (or 4) ft. wide, sometimes of stone and sometimes of wood. It stands out from the east wall, as in the Jacobite churches of Mesopotamia, in contrast to the Nestorian altars. At the eucharist the altar is covered with a white cloth, and has a frontal. On it are placed a wooden cross (often with the figure of our Lord painted on the wood), two candlesticks, a book-stand, a slab of wood or marble for the chalice and paten to rest upon, a 'sponge' of silk for wiping the priest's fingers and for cleansing the chalice after the service, and three veils for the chalice and paten. The bread is leavened, and must be prepared on the day when it is used; each bread is round, and stamped with a cross. It is called variously *Qōrbānā* ('Oblation'), 'first-begotten,' 'the Seal,' 'the Body,' 'the Coal' (Is 6[6]). These are common Syriac names elsewhere for the eucharistic bread. The naves of the churches have earthen floors; they have no furniture except two bells inside the church; a gallery is often placed at the west side of the nave. On the nave-side of the chancel arch there is a space railed off, not unlike the Nestorian *bema* (see above, § 8), but some 12 ft. wide as compared with a 3 ft. width of the *bema*. The churches sometimes have pictures;[2] this is probably a relic of Portuguese influence. There is always a veil at the chancel arch, which is drawn back at certain parts of the service. Externally the churches have little adornment; the west front has three storeys, and is whitewashed. The roof is high-pitched, that of the chancel being always higher than that of the nave. The vestments worn seem to be much the same as those of the Jacobites of Mesopotamia (see § 5), and are more elaborate than those of the Nestorians. At the eucharist the celebrant wears special shoes, whereas the Nestorians take their shoes off; also a black serge or coarse cotton robe (perhaps a sort of cassock), a white linen albe, a stole in one piece with an opening for the head, girdle, maniples, chasuble (or cope) of silk damask, and cap.[3] At ordination the clergy receive the tonsure,[4] as do the Nestorians, the latter, however, only cutting off some of the ordinand's hair in the form of a cross. As in the worship of all Syrian Christians, much incense is used at the eucharist and other services.

In some externals, especially in the matter of vestments, the Nestorian Malabarese seem to have assimilated their customs to those of their Jacobite neighbours.

10. Modern missions. — Besides the Jesuit, Dominican, and Lazarist missions to the Uniat bodies mentioned in § 6, there have been during the last 80 years various missions to the Jacobites and Nestorians. The American Presbyterian and Congregational Boards of Missions have long had missionaries among them; the Archbishop of Canterbury's educational 'Assyrian Mission' has worked among the East Syrians since 1886; and later the Russian Church sent a mission to them. Similarly missionaries from the West have laboured among the Malabarese in India. To all these missions we are largely indebted for a knowledge of the people, and for the publication of the Bible in classical and vernacular Syriac, of patristic texts, and of other liturgical and educational works.

Lidzbarski, *Die neu-aramäischen Handschriften*, Weimar, 1896; D. J. Stoddard, *Modern Syriac Grammar* (American Oriental Society, vol. v., 1856), published separately, London, 1855; R. Payne Smith, *Thesaurus Syriacus*, 2 vols., Oxford, 1870–1901. The Bible in the Urmi dialect has been published by the American Bible Society, New York, 1893 (earlier edd. at Urmi), and many books in the same dialect have been published at Urmi by the various Mission presses there.

vii. *LITURGICAL BOOKS USED BY SYRIAN CHRISTIANS*.—(*a*) *Translations*.—F. E. Brightman, *Liturgies Eastern and Western*, i., Oxford, 1896 (has Eng. trr. of 'Syriac St. James' [West Syrian] and 'Addai and Mari' [East Syrian], and a Latin translation of an East Syrian liturgy in fragments first published by G. Bickell); J. P. Margoliouth, *Liturgy of . . . Addai and Mari* (with two other East Syrian liturgies and the baptismal service), London, 1893; E. Renaudot, *Liturgiarum Orientalium Collectio*[2], 2 vols., Frankfort-on-Main and London, 1847, vol. ii. (Latin tr. of several Syriac liturgies, Eastern and Western); A. J. Maclean, *East Syrian Daily Offices*, London, 1894 (Eng. tr.) and *East Syrian Epiphany Rites* (Eng. tr. in one volume, with F. C. Conybeare's *Rituale Armenorum*), Oxford, 1905; G. P. Badger, as above (iv.) (Eng. tr. of East Syrian liturgies, etc.); G. B. Howard, as above (v.) (Jacobite Malabar liturgies); H. Denzinger, *Ritus Orientalium*, 2 vols., Wurzburg, 1863–64 (baptismal-, marriage-, and ordination-services of the minor Eastern Churches, etc.; Lat. tr.); J. M. Neale, *The Liturgies of St. Mark . . . and the Church of Malabar*, London, 1859 (Eng. tr. of the Malabar Nestorian liturgy). (*b*) *Syriac texts*.—For the Nestorians the Archbishop of Canterbury's Assyrian Mission has published from the old MSS: *Ṭākhsā* (the three anaphoras, baptismal-service, etc.), London, 1890; *Qdhām ū-Wāthar* (Daily Offices), do. 1892; *Liturgical Psalter*, do. 1891; *Lectionary Tables*, do. 1889; *Sūrgādhā* (calendar tables), do. 1894; *Būrākhā* (marriage-service), do. 1892; *'Anidhā* (burial-service for laymen), do. 1900; *Bā'uthā* (service for the Rogation of the Ninevites), do. pt. i., 1894, pt. ii., 1902. For the Uniat Chaldæans the Lazarists have published similar works adapted to that community, especially *Liber psalmorum, Horarum Diurnarum, Ordinis Officii Divini et Homiliarum Rogationum*, Paris, 1886; *Breviarium Chaldaicum*, do. 1886; older is the *Missale Chaldaicum*, Rome, 1767 ('Addai and Mari' only). For the Uniat Malabarese see *Ordo Chaldaicus . . . juxta ritum ecclesiæ Malabaricæ*, Rome, 1775 and 1844. For the Jacobites no Syriac text of St. James appears to have been published (Brightman, i. p. lvi), but for the Syrian Uniats see *Missale Syriacum*, Rome, 1843, and *The Book of the Clerks* (in Syriac), Beirut, 1888. For the Maronites see *Missale Chaldaicum juxta ritum . . . Maronitarum*, Rome, 1592 and 1716, Qozhayya, 1816, 1838, and 1855, Beirut, 1888; *Liber ministri missæ*, Rome, 1596 and 1715; *Diaconale Syriacum*, do. 1736. An old but general collection of texts and Latin translations is J. A. Assemani's *Codex Liturgicus Ecclesiæ Universæ*, Rome, 13 vols., 1749–66 (eucharistic liturgies, baptismal offices, ordination-services, etc.). For a fuller bibliography of Syriac liturgies see Brightman, as above (Introduction).

viii. For *SYRIAC TEXTS* of early works by Syrian Christians see W. Wright, *Short Hist. of Syriac Literature*, London, 1894.

A. J. MACLEAN.

T

TABERNACLES.—See FESTIVALS AND FASTS (Hebrew).

TABU.—The word 'tabu' is properly an adjective and appears to mean literally 'marked off' (perhaps from Polynesian *ta*, 'mark,' *pu*, 'exceedingly'). Applying equally to persons and things, it signifies that casual contact with them is forbidden as being fraught with mystic danger. Custom enjoins a negative or precautionary attitude towards them because of the supernatural influence with which they are temporarily or permanently charged. In short, they are 'not to be lightly approached,' and that always for some magico-religious reason. The term is native to the Pacific region, but has been adopted, with some modification of meaning, to designate a fundamental category of comparative religion. Thus, as in regard to the cognate term *mana* (*q.v.*), it is advisable to distinguish the local from the generalized sense.

1. Local meaning of tabu.—(*a*) *Cook's discovery of tabu.*—'Taboo,' used indifferently as adjective, noun, or verb, was introduced into English by Captain Cook. He first met with the word, in 1777, at Tonga.[1] Hence, by the way, the popularization of the Tongan form *tabu*, *tapu* being usual elsewhere in Polynesia, with *kapu* in the Hawaiian group; though in Melanesia *tabu* again occurs, as also *tambu*. When Cook later on discovered the Sandwich Islands, he found the institution of tabu prevailing there with even more rigour than at Tonga, whereas it seemed to him to have been less strictly observed in the Society Islands, except as regards the tabu resulting from contact with the dead.[1] He gives a clear and consistent account of the notion involved, stating that tabu 'has a very comprehensive meaning, but in general signifies that a thing is forbidden,' being 'applied to all cases where things are not to be touched.' He also emphasizes its 'mysterious significance' and duly notes the 'mixture of religion' in a certain ceremony concerning which 'we seldom got any other answer to our inquiries but *taboo*.'[2] Moreover, he makes it clear that religion herein made common cause with law and government. In reference to the same ceremony, he says: 'When we returned to the king, he desired me to order the boat's crew not to stir from the boat; for, as every thing would, very soon, be *taboo*, if any of our people, or if their own, should be

[1] See J. Cook and J. King, *A Voyage to the Pacific Ocean, 1776–80*, London, 1784, i. 286, and *passim*.

[1] *A Voyage to the Pacific Ocean, 1776–80*, ii. 249.

[2] *Ib.* i. 286, 350, ii. 40.

found walking about, they would be knocked down with clubs, nay, *mateed*, that is, killed.'[1]

Indeed, Captain King (who carries on the story after Cook's death) is perplexed to decide how far the 'implicit and scrupulous obedience' of the natives in regard to the prohibitions laid upon them—as when Karakakooa Bay was tabued, at the request of the navigators, while the remains of Captain Cook were being committed to the deep—was due to some 'religious principle' and how far to 'the civil authority of their chiefs.'[2] The whole account, however, makes it clear that king, chiefs, priests, and the gods themselves, formed one undivided theocracy, whereof tabu constituted the chief instrument, at once spiritual and temporal in its nature and effects. More especially, it ensured a complete control of the economic situation. Thus at Tonga the special officer who 'presided over the *taboo*' was a veritable food-controller:

'He and his deputies inspected all the produce of the island; taking care that every man should cultivate and plant his quota; and ordering what should be eat, and what not. By this wise regulation, they effectually guard against a famine; a sufficient quantity of ground is employed in raising provisions; and every article, thus raised, is secured from unnecessary waste.'[3]

For the rest, tabu was the corner-stone of the class-system, ensuring the subjection of women to men, of the lower orders to the chiefs, and of all to the king, whose very name was tabu on penalty of death.[4]

(*b*) *Primary connexion of Oceanic tabu with a theocratic system.*—Here, then, in this alliance of the religious with the civil forms of authority, we have the distinctive mark of tabu as understood in its local sense. R. Taylor's definition of it, as 'a religious observance established for political purposes,'[5] hits off what is at any rate its leading aspect in Oceania. In the Polynesian islands a class of chiefs with a social influence proportionate to their *mana*, or supernatural power, was everywhere recognized; and in the Eastern groups at any rate there were supreme potentates who might fairly be termed kings, though sometimes, as at Tonga in Mariner's day, the religious head of the community might be said to reign while the war-chief, his inferior in the hierarchy, actually governed.[6] On the other hand, no chieftainship proper is to be found in Melanesia. Here, however, the secret societies exercise a tumultuous, but none the less forcible, control over affairs by means of tabu; while, conversely, 'in cases where the English word taboo can be employed there is always in Melanesia human sanction and prohibition.'[7] Thus there is every reason to suppose that throughout the Pacific we have to do with customs belonging to a single type. This view is supported by the remarkable fact that, despite the diversity of tongues obtaining in this wide area, the word tabu in one of its dialectical forms, as well as the complementary term *mana*, is in general use. But, if the nature and name of the institution are uniform, so presumably will be its origin. On the strength of this argument, W. H. R. Rivers has recently tried to show that tabu in its Oceanic distribution stands everywhere alike for the prestige acquired and the authority exercised by an immigrant folk—his so-called '*kava* people'—in its dealings with an indigenous population of markedly inferior culture.[8] It is interesting to speculate how a system of tabus may have developed on the spot under stress of such culture-contact—how, for instance, barbarians, already worshipping gods and respecting private property, might come to impose their will on magic-haunted communistic savages, for whom threats rather than reasons must be provided as the grounds of obedience. On the other hand, if the immigrants came from Indonesia, as the theory assumes, it is also possible that they brought some form of the custom with them ready-made, since the Indonesian *pomali* is 'exactly equivalent to the "taboo" of the Pacific islanders.'

Thus in Timor 'the custom of "tabu" called here "pomáli," is very general, fruit trees, houses, crops, and property of all kinds being protected from depredation by this ceremony, the reverence for which is very great. A palm branch stuck across an open door, showing that the house is tabooed, is a more effectual guard against robbery than any amount of locks and bars.'[1]

This mode of indicating a tabu is similar to the Oceanic. Thus, when Cook wished to set up his observatory in the Sandwich Islands, the priests tabued the place for him by setting up wands;[2] and the *soloi*, or tabu-marks, of the Banks group in Melanesia usually consist of the leaves of some plant.[3] It may well be, then, that the property-mark, with its implication of a transferable curse, came into Oceania along with the notion of private ownership. It certainly was most effective in protecting property—far more so than the guns which the early mariners discharged at the thievish islanders with a like object in view.

(*c*) *Secondary developments of tabu in Oceania.*—It remains to note that, whereas the essence of tabu in its local signification consists, as has been shown, in a theocratic form of government, which in its turn may have developed by way of an apotheosis of landlordism, the ramifications of the notion are endless and cover the whole religion of Oceania, at any rate so far as it is taken in its negative aspect, namely as a system of scruples. The theocracy could consecrate a site, or devote a victim, or appropriate a house or canoe, or betroth a woman, or proclaim a rest-day for men or a close-time for game, all these being cases of the communication of tabu by a ritual act of imposition, such as could at will be neutralized by a ceremonial removal.[4] On the other hand, many tabus were inherent rather than acquired, such as those associated permanently with women, strangers, the sick, and the dead, or for the time being with the woman in child-birth or the warrior on a campaign. The world-wide distribution of similar beliefs concerning an infectious impurity makes it extremely improbable that they can be referred in the mass to an immigrant culture or treated as mere reasons of state, the by-products of the administrative scheme. At most we may say that, in so far as the direction of affairs was centralized and deliberate, they were incorporated in the political machine and to a like extent became subject to manipulation. Thus, at Hawaii in 1819, King Rihoriho at one stroke abrogated the laws of the tabu; though only, let us note, to make way for *la tabu*, the British Sunday.[5] So much, then, for the local or Oceanic sense of tabu with its special connotation of a theocratic system of controls, a more or less consciously organized body of sanctions backed by the joint authority of Church and State.

2. Scientific meaning of tabu.—(*a*) *Tabu as an aspect of rudimentary religion.*—For the purposes of the science of comparative religion it is convenient to drop the implication of a human sanction and to insist solely on the supernatural

or mystic aspect of the penalties in store for the tabu-breaker. In this way it is possible to bring together under one head a large variety of avoidances characteristic of the less advanced peoples, of whom it may broadly be said that they have no king but custom. Just as their response to traditional rules is largely automatic, so, correspondingly, the rule itself has imputed to it a no less automatic power of self-maintenance and self-vindication. Indeed, so necessary is it for general purposes to lay stress on the immanence of the sanction normally attributed to a tabu that it is safer to deny the name altogether to prohibitions deriving their force mediately from a god or his earthly representative and to distinguish these as religious interdicts or bans. Tabu, in short, is to be understood as meaning 'unlucky to meddle with' rather than forbidden by edict human or divine. It belongs to what may be termed the perceptual (Lévy-Bruhl would say 'prelogical') stage of religion, when values are massively apprehended without analysis of their grounds. At this stage emotion of the collective or mobbish order is paramount as regards both the excitatory and the inhibitive processes that govern the social life. Now of all the emotions fear is inhibitor-in-chief, having in virtue of its haunting quality a special power of sustained control. A primary source of fear is the unfamiliar or strange as such; and this kind of fear in varying degree is always present as an element in that complex emotion of awe or reverence which is the root of religion. Tabu, then, stands for the whole mass of such fear-inspired inhibitions in so far as they proceed directly from the religious emotion, as it regulates the social tradition in the relative abeyance of reasoned direction. Here we have at any rate the psychological clue to a vast variety of customary abstinences—'negative rites,' as they may be called—of which the particular conditions are a matter for historical treatment in detail.

(*b*) *Tabu and the notion of contagion.*—It may next be noted that emotions are infectious. It is, indeed, the leading principle of mob-psychology that emotions are propagated more readily than ideas, their external manifestations lending themselves to unintelligent imitation. Moreover, fear is, perhaps, the most infectious of all. Hence the fear-inhibition embodied in tabu always implies an infectious unluckiness—a transferable curse on meddlers. As A. van Gennep in his analysis of the *fady* (=*tabu*) of Madagascar shows, the institution rests on two notions, one being that of *tohina*, 'contagion.'[1] 'Everything,' says Jevons, 'which comes in contact with a tabooed person or thing becomes itself as dangerous as the original object, becomes a fresh centre of infection, a fresh source of danger to the community.'[2]

Jevons goes on to discriminate between 'things taboo,' the primary sources of such contagion, and 'things tabooed,' in which the tabu-infection is not inherent but derivative.[3] 'A single thing taboo might infect the whole universe,' as he says with pardonable exaggeration;[4] but in practice the transmissible fear is strictly limited in its possible effects, being confined to certain channels prescribed by convention. Meanwhile it is not always easy to draw the line between the two classes. The clearest cases of 'things tabooed' are those in which, as in Oceania, a divine chief tabus something hitherto common, or *noa*—say, a hunting-ground—and then after a time restores it to ordinary use. But, when Jevons accepts at its face-value the Polynesian explanation that the tabu on the sick is due to the fact that they are possessed by an *atua*, or spirit, and therefore pronounces them 'tabooed but . . . not taboo,'[1] it is at least arguable that a 'pre-animistic' basis must be sought for the belief; for what more perceptibly contagious than certain (and those precisely the stranger and more alarming) forms of disease? It is surely no mere superstition to suppose that sickness—nay, as it were, death itself—is 'catching.' On the other hand, it is hardly profitable, in deference to the theory that the emotions of man afford the best criterion of his instincts, to regard 'things taboo' as so many danger-signals to which mankind has an innate predisposition to attend. Tabus need rather to be studied in relation to their proximate conditions, which are not biological but historical. In other words, tabus are primarily matters of custom, forming part of the social inheritance, not of the individual heredity.

(*c*) *Tabu and the notion of supernatural power.*—The other notion on which the tabu of Madagascar rests, according to van Gennep,[2] is that of *hasina* =*mana*, or supernatural power. The person or thing is not to be trifled with, because liable to react with a force of unknown range and degree. There is a spiritual electricity that must be insulated lest it blast the unwary. Now, if religion were all fear, such *mana* would rank as wholly bad, since fear is a shrinking from evil. But other primary constituents of the religious mood make rather for interest, receptivity, approach, communion. For reckless self-assurance, indeed—for what the Greeks knew as ὕβρις—there is always 'the devil to pay.' But fear tempered with wonder and submissiveness, and thus transmuted into reverence, is the forerunner of love. So *mana* has its good side as well, though from the standpoint of tabu this helpfulness remains, so to say, in reserve, being a consummation that lies beyond the purview of the fear-inhibition as such. Meanwhile to an advanced theology that has clarified its concepts by the method of antithesis the savage apprehension of *mana* by way of tabu seems blurred and equivocal, an experience of something monstrous, half-devil and half-god. And that there is some such ambiguity in the value perceived cannot be denied. The sacred and the abominable, the pure and the obscene, the hallowed and the accursed pivot within the same perturbed awareness of the object. Nevertheless, rudimentary religion has gone a long way towards defining in practice, if not in theory, the good and the bad manifestations of the hidden power. Thus the novice at initiation or the warrior on a campaign is tabu that he may seek and find grace in the self-concentration that ensues after spiritual crisis overcome. On the other hand, the criminal is tabu because his very soul is attainted; wherefore, as the words of his doom, 'Sacer esto,' imply, he cannot touch water and fire lest he sully their purity with his foulness.

(*d*) *Tabu as a source of personal religion.*—At this point it may be observed that the institution of tabu is not only the main organ of social discipline at the lower levels of culture, but likewise the seed-bed of personal religion. The latter function hinges on the fact that to be tabu with respect to society is at the same time to be tabu in relation to oneself. The external signs of this self-regarding attitude of precaution are often ludicrous enough, as when a man cannot feed himself, or must scratch his head with a stick, or needs to snuff up the holiness that exudes from his fingers. But an inward-seeking view reveals a profit even in such practices. The *mana* to be conserved is just that part of a man that he feels to be most

[2] *Loc. cit.*

worth the saving—the will for power. Such power may be coveted for temporal ends. Savage shepherds of the people are not more disinterested than the rest of their kind. But at least it is proximately envisaged as a spiritual power. At least it is the sort of power that comes with and after self-abnegation and the exercise of humility. There is good evidence, too, that a sense of unworthiness consequent on the violation of his self-regarding tabus—as one might say, his 'vows'—is enough to cause voluntary resignation of office on the part of the primitive wonder-worker. There can be no doubt, then, that the experience both of the access of inspiration and of its withdrawal is often perfectly genuine; and, again, that the due safeguarding of such a gift is a lesson first acquired in the school of tabu. Further, not to lay exclusive stress on the ecstatic experience peculiar to the religious genius, the whole development of personality, so far as this comes about by way of reverie and reflexion, arises largely out of the tabu condition. No other such opportunity is afforded in the gregarious life of the savage tribesman for that self-communing whereby man eventually becomes master instead of slave of the sense-world. Self-respect, again, is nourished on privacy; the king or priest must keep his distance from the *profanum vulgus*, lest he make himself cheap not only in their eyes but also in his own.[1] For the rest, tabu stands for the etiquette of savage life, and by encouraging mutual consideration enables manners to ripen into morals, the end of which is freedom.

(*e*) *Danger of the over-development of tabu.*—Hitherto the fruitfulness, the educative value, of tabu as a factor in religion of the perceptual or rudimentary type has been chiefly signalized. After all, the inhibition of impulse affords the measure of human advance. But such inhibition may be overdone, with paralysis of the will to live as a consequence. Tabu as such represents negation, and a religion made up mostly of negations is necessarily sterile. Denial, even self-denial, cannot but be soul-destroying, if taken as an end in itself. Hence a meticulous scrupulosity is a mark of degraded religion. Nothing, *e.g.*, is so characteristic of the dairy-cult of the Todas as the web of tabus in which every action of the priest-dairyman is emmeshed, and Rivers not without good reason comments: 'The Todas seem to show us how the over-development of the ritual aspect of religion may lead to atrophy of the ideas and beliefs through which the religion has been built up.'[2]

Even a positive rite such as prayer may degenerate into formalism. Much more is this likely to happen with the negative rite or tabu, wherein the nature of the spiritual activity subserved is less immediately manifest. In the last stage of such decay—and in this also the case of the Todas is instructive[3]—the scrupulosity itself tends to become a sham, an organized hypocrisy of evasions. The function of ritual in religion is to relieve attention in regard to things indifferent, and of negative ritual to do so in regard to things actually disturbing—all this in order to set attention free for active converse with the divine. It is true that there is in many forms of religious experience—and they are perhaps especially to the fore in rudimentary religion—a characteristic prelude of apparent inaction, a spell of listening, as it were; and, so far as the tabu condition corresponds to this halt on the threshold, it is apt to seem barren of results when it is not. To judge fairly in each case, we must watch the ritual drama as a whole to see whether the passivity induced is of the pregnant order. As an incident in a 'rite of passage' to a higher plane of experience, the chrysalis stage of the soul is symptomatic of development. If, on the other hand, the will to win through be somehow asphyxiated on the way, negation has triumphed; too much safeguarding has destroyed; the husk has stifled the germinal process.

(*f*) *Methods of studying tabus in detail.*—This cursory sketch of tabu aims at no more than a generalized version of the institution as it bears on the earlier growth of the spirit of religion. A fuller treatment might be based on the study of the particular systems of tabu native to the various ethnic areas—as has here been attempted only in regard to the Pacific region—when many differences of detail and shades of local colour would doubtless come to light. In defence of the present method, however, it can be urged that to deal with tabus on the ethnological principle would well-nigh involve a survey of religions on the same distributive plan, since every savage people has a religion and every savage religion has its tabus. Nay more, savage religion tends to be co-extensive with the social life itself; so that a regular panorama of cultures may seem to be the logical outcome of such a method. Another way of dividing up the subject (but one again that must inevitably lead too far afield) would be that of distinguishing certain main departments of activity typical of primitive society as a whole and showing how each is conditioned by its own set of special tabus. The food-interest, *e.g.*, is engirdled by one vast network of ritual controls, the sex-interest by another. Indeed, the critical stages of every vital process are hung about with such customary danger-signals. Sometimes these traditional fears can be shown to correspond to facts; more often they appear arbitrary, sheer aberrations of fancy, due to false analogy or what not, that have been incorporated in the tribal lore by a historical chance. Thus, however detailed our study of tabus, we are not likely to arrive at the explanation of minor features. For these reasons it has seemed preferable here simply to enlarge on the general principle that, at the primitive level, the object of religious belief or worship is always tabu, just as it is always *mana* as well; and that, moreover, tabu forms the hither aspect of the religious experience, inasmuch as fruition is reached through fear.

(*g*) *Tabu from the standpoint of civilization.*—Tabu being properly an institution of savagery, it would hardly be in point to consider at length its ulterior consequences for civilization—as apart from its survivals in folk-lore, which indeed are numerous. But a word about such after-effects may be added by way of conclusion. We must not look for them solely within the sphere of religion as it is now. With the gradual substitution of a rational for an emotional system of controls, there has come about a decentralization of authority whereby disciplines once merged in an all-pervasive religious sanction have been invested with quasi-independent functions. Politics to-day deals with the divine right of kings, law with the sacredness of property, morals with the virtues of temperance and chastity, and so forth. In all such cases the tendency is to refuse any validity to the old-world sentiment of tabu. Reason prefers to rest its case on grounds of so-called common sense. At most the immediacy and seeming unconditionality of the tabu-feeling might enlist the sympathies of certain schools of ethical thought. As for modern religion, while it hesitates to adopt a rationalist outlook, it is naturally anxious to purge its traditional rites of the mildew of ancient superstition. On all sides, however, so far as the influence of a philosophy of man makes

[1] Cf. *kapukapu*, 'to put on airs of distance or separation from others,' with *mamana*, 'to respect oneself,' in E. Tregear, *The Maori-Polynesian Comparative Dictionary*, Wellington, N.Z., 1891, pp. 203, 473.

[2] *The Todas*, London, 1906, p. 455. [3] *Ib.*

itself felt, there is of late manifested a deeper interest in the emotional life, more especially as it relates to conduct. Alike in social psychology with its study of the crowd and in individual psychology with its doctrine of the subconscious the conviction is growing that society and mind alike are controlled from below, as it were, as well as from above—that reason is at best a constitutional ruler whose authority rests not on force but on consent. It may be, then, that, examined from this point of view, the primitive institution of tabu will be found to embody elemental principles of order that to-day are as active as ever beneath the surface of a changed custom. Experience, which is experiment, has doubtless taught us to reject many a freakish usage dear to the old order; but this experience, which in its most critical form is science, bids us seek beneath the accidents of history for those essential laws whereby our racial sense of direction is continuously maintained.

LITERATURE.—(i.) For tabu in Oceania see the works cited above, early authorities such as Cook and Mariner being especially enlightening, since the original social system has long been gone, at any rate in Polynesia; compare also Th. Waitz and G. Gerland, *Anthropologie der Naturvölker*, Leipzig, 1859–72, vi.; W. Ellis, *Polynesian Researches*, London, 1831, iv.; G. Turner, *Samoa a Hundred Years Ago and Long Before*, do. 1884; *Old New Zealand*, by a Pakeha Maori, do. 1884; since the same cultural influences presumably extend to Indonesia and the Malay region (including Madagascar), see also W. W. Skeat, *Malay Magic*, do. 1900. A. van Gennep, *Tabou et totémisme à Madagascar*, Paris, 1904, brings the local into relation with a general interpretation.

(ii.) For a world-wide review of the facts about tabu see J. G. Frazer, *The Golden Bough*[3], 12 vols., London, 1911–15, esp. vol. iii., *Taboo and the Perils of the Soul*, and for his general theory vol. i., *The Magic Art*, i. 111 ff., also *Psyche's Task*[2], do. 1913. The subject being germane to any systematic account of primitive religion, it is hard to draw up a short list of authorities, but the following, in addition to those already quoted in the text, will be found useful: W. Robertson Smith, *Lectures on the Religion of the Semites*[2], London, 1894; E. Crawley, *The Mystic Rose*, do. 1902; E. Durkheim, *Les Formes élémentaires de la vie religieuse*, Paris, 1912, esp. p. 427 f.; and, on special aspects of tabu, Crawley, *FL* vi. [1895] 130 ff.; E. Westermarck, *Marriage Ceremonies in Morocco*, London, 1914; H. Webster, *Rest Days: a Study in Early Law and Morality*, New York, 1916. For a psychological study of tabu see R. R. Marett, *The Threshold of Religion*[2], London, 1914; E. S. Ames, *The Psychology of Religious Experience*, do. 1910.

TAHITIANS.—See POLYNESIA.

TALISMAN.—See CHARMS AND AMULETS.

TALMUD.—Two great works are known under the title 'Talmud'—a word (תַּלְמוּד) which denotes primarily 'teaching' and secondarily 'learning.' The two works are the Palestinian and Babylonian recensions, both of which are, in form, commentaries on the text of the Mishnāh (מִשְׁנָה). The Mishnāh ('repetition,' hence oral teaching by repeated recitation) was completed about A.D. 200. The Talmud consists of the Mishnāh with the Gemara (גְּמָרָא). It represents the scholastic activities of the Jewish Rabbis from the beginning of the 3rd to the close of the 5th century A.D.

The history of the compilation of the Talmud has been dealt with in many treatises and essays.[1] It is not the design of the present article to add to these or to reconsider the critical literary problems involved. Two practical questions will occupy us: (1) the attitude of the outside world to the Talmud,[2] and (2) the causes and nature of the permanent value of the Talmud within Judaism.

1. The Talmud in history.—The century which saw the completion of the Talmud also witnessed the beginning of interference with the normal circulation of the Rabbinical literature. In the year 553 the Emperor Justinian was called upon to arbitrate on a difference which arose between two sections of Jewry in the Byzantine realm. Whereas some were desirous of publicly reading the Scriptures both in Greek and in Hebrew, others wished to use the Hebrew only. Justinian[1] ordered the præfect Areobindus to promulgate the imperial decision in favour of the use of Greek (the Synagogue might use Aquila if it preferred it to the Septuagint), or of other vernacular tongues such as Latin in the Italian provinces. The emperor, moreover, forbade any attempt on the part of the heads of the schools or elders to prevent the use of the vernacular by devices or excommunication. Most significant of all was Justinian's interdiction of the practice of giving the Haggādic exposition (δευτέρωσις) after the reading of the Scripture. The opening words of the rescript explain Justinian's intention. The Jews, he suggested, should read their Scriptures with an eye to the hidden meaning and see in them a prophetic announcement of Christianity. Hence the emperor would naturally desire to curb the popularity of the Rabbinic exegesis, which of course would confirm the Jews in their refusal to admit Christological interpretations. Thus Justinian, who introduced drastic legislative enactments against the Jews, was also among the first to attempt interference with the free use and spread of their literature.[2]

We must here confine our attention to that phase of interference which concerns the Talmud. It was not till the 13th cent. that the attack assumed practical shape. Paris, in the year 1244, was the scene of the first public burning of copies of the Talmud. Before that date the Rabbinic doctrines had been assailed in the *de Insolentia Judæorum* of Agobard; but from the Paris incident onwards these assaults became far more frequent and dangerous. Nicholas Donin of La Rochelle had, while a Jew, been excommunicated by the Rabbi Yeḥiel of Paris because of his denial of the validity of the Rabbinic tradition. This occurred in 1225; he subsequently joined the Franciscans, and in 1239 he formally laid an accusation against the Talmud before Pope Gregory IX., who addressed bulls to many lands (including England) ordering the seizure of copies of the Talmud pending a public inquiry. In France the matter was seriously taken up. Charges of blasphemy, immorality, particularism, and absurdity were formulated; a public dispute between Donin and four Rabbis was ordered. The humours and futilities of such debates have been satirized in Heine's poem 'Disputation.' But the consequences were deplorable. The Talmud was condemned; many copies of it were burnt; and popular outbreaks against the Jews resulted.

Within a few years similar scenes were enacted in Barcelona. Here again the attack originated with a Jewish convert to Christianity, Pablo Christiani. He instigated a public debate between himself and Naḥmanides in 1263, as to the attributes and coming of the Messiah, and the Rabbi was sentenced to exile because his defence of Judaism was pronounced blasphemous. In 1264 Christiani induced Pope Clement IV. to appoint a Commission of censors, who expunged all those passages which appeared derogatory to Christianity. In particular, as time went on, Talmudic references to ancient paganism were misinterpreted as being attacks on the Church. This charge was brought forward by yet another erstwhile Jew, Geronimo de Sante Fé, who engineered a public dispute in Tortosa in 1410, and, like Christiani, submitted to the verdict of the crowd the most intricate problems of Biblical exegesis in relation to Messianic belief. The practical outcome again

[1] *Novellæ Constitutiones*, 146.
[2] The view of Justinian's rescript given in the text is the one usually adopted. It is by no means the only possible explanation, for it is possible that what Justinian prohibited was the use of the traditional Aramaic translation (see art. TARGUMS).

was not a settlement as to the significance of Is 53, but the confiscation of copies of the Talmud.

Of much greater interest was the controversy which waged round the Talmud at the beginning of the 16th century. Owing to the part taken by Reuchlin (*q.v.*) in this incident, the Talmud became the battle-ground between the old and the new, between the obscurantists and the humanists. Again the protagonist in the attack on the Talmud was one who had left the Synagogue for the Church. It must not, however, be thought that the proverbial zeal of converts has invariably assumed this guise. In the recent assaults made on the Talmud by representatives of modern anti-Semitism (*q.v.*), powerful among the defenders of the fair fame of the Rabbinic system were such famous Judæo-Christian scholars as Daniel Chwolsohn and Paulus Cassel. The opponent of Reuchlin was of a different type. We know very little as to the antecedents of Johann Pfefferkorn, of whom Erasmus said that from a bad Jew he became an execrable Christian ('ex scelerato Judæo sceleratissimus Christianus'), for no reliance can be placed on the insinuations made by satirists that in his earlier days Pfefferkorn had added to the respectable calling of a butcher the disreputable career of a burglar. All that we know is that Pfefferkorn was animated by a strong animosity towards his former co-religionists, that his fanaticism far exceeded his learning, and that he found support for his campaign among the Dominicans of Cologne. Though the Jews had been excluded from that city in 1426 and only regained rights of free domicile there with the coming of the French in 1798, Cologne remained during the 15th and 16th centuries the headquarters of the campaign against Jewish books.

It would be unprofitable to repeat the details of the oft-told tale of Pfefferkorn's pamphlets and Reuchlin's rejoinders; of the seizure of Hebrew books in Frankfort-on-the-Main in 1509, their restoration, and the long-drawn-out struggle that ensued in Rome. Nor is it of any importance to us now whether or not Pfefferkorn wrote the works that bear his name. The whole incident would have been forgotten but for certain facts. In the first place, this battle of the books gave rise to a famous satire, the *Epistolæ Obscurorum Virorum*, the first part of which appeared at Tübingen towards the end of 1514. The effect of this rather savage satire was instantaneous and permanent. As an exposure of obscurantism it remains one of the most masterly efforts ever put forward on behalf of humanism. The struggle between Reuchlin and Pfefferkorn became, in short, elevated to a higher plane. Reuchlin, once for all, struck the true note when he protested against the destruction of a literature because elements of it were distasteful to certain of its critics. 'If the Talmud contains errors,' he said, 'let us render them innocuous by studying to sift the chaff from the grain. Do not burn the Talmud, but read it.' It is to Reuchlin that we owe the foundation of Hebrew chairs in the universities; the first Hebrew text printed in Germany was the edition of seven Psalms used by Reuchlin in 1512. The study of Hebrew in Christian Europe commenced with him, was taken up by his immediate successors, and has never since been relinquished.[1] Reuchlin's devotion to Rabbinism began with his interest in the Ḳabbālā. But Hebrew was the passion of his life. And there is no doubt that to him we owe that interest in the Talmud which soon led to the publication of a complete printed edition of all its tomes. There were, as we shall see, printed editions of parts of the Talmud available in 1510, when he wrote that 'he would like to pay the price for a copy of the Talmud twice over but he had not yet been able to obtain one.'[1] He was referring to MS copies. Within about a decade of the year in which Reuchlin wrote this lament it was easy to procure the Bomberg edition printed in Venice. It was fortunate for scholarship that Daniel Bomberg began to print the Talmud in 1520, before the censorship intruded its hand. Yet the censorship has this value. In 1550 the Talmud was placed on the Index. But the Tridentine Synod in 1564 provided that the Talmud might be circulated, if the passages obnoxious to Christianity were deleted. This was done, and between 1579 and 1581 there was completed the censored Basel edition which formed the model for many subsequent editions. In this form, claims the Basel editor, the Talmud may be read by Christians not only without reproach but even with profit ('etiam cum fructu a nostris legi potest'). The Inquisitor Marco Marino went through the Venice edition of 1546–50, censored it, and affixed his name to the expurgated version page by page. The expurgated passages have often been edited and commented on separately. Attacks on the Talmud, nevertheless, continued. As late as 1757 copies of the Talmud were publicly burned in Poland as a result of the Kamenetz-Podolsk disputation. Literary onslaughts have naturally continued, and modern anti-Semitism has displayed much energy in seeking in the pages of the Talmud grounds for attacks on the Jews. Those pages contain enough and to spare of superstition, narrowness, folly, and intolerance. But the faults are superficial, the merits fundamental; and it is because of the latter that the Talmud retains its permanent worth.

2. **Permanent value.**—In the first instance the Talmud represents more fully than any other Jewish work the lineal development of the religion of the OT. In several important particulars, the Talmud, indeed, represents an advance on the OT. The view (adopted by the school of R. H. Charles) is untenable that Rabbinism was a degeneration, while Apocalypse was an advance. On the contrary, all the nobler elements of the OT teaching were absorbed into and developed by Rabbinism, which was essentially a prophetic system. The moral life was at once the basis of religion and its ultimate outcome. The Talmud concerned itself with life. It therefore drew little or no distinction between the secular and the religious. This is not the place to discuss the Pharisaism which is assailed in the Gospels. For, however we explain the discrepancy, the Pharisaism of the Gospels is not identical with the Pharisaism of the Talmud.

Hence, though the Talmud, because it combines secular and religious into one whole, is often inclined to attach undue importance to ritual or customary trivialities, it cannot be said that it does so at the expense of the great principles. And, when all has been said, the fact remains that, difficult though it be to harmonize the daily round with the higher calls of spiritual moments, the Talmud did effect this harmonization with a considerable measure of success. The Talmud is interpenetrated with the presence of God in human life, and worship was not merely confined to the hours spent in congregational prayers. The home was sanctified as well as the synagogue. This fact constituted and constitutes the worth of the Talmud to the Judaism of all ages. The liberals who have rejected the authority of the Talmud have not rejected its spirit and its outlook.[2] They, like the conservatives, feel that the hallowing of life is the purpose of life. And, among the many attempts to effect this hallowing of life — in relation primarily to God, but also in intercourse

[1] S. R. Hirsch, *A Book of Essays*, London, 1905, p. 14.

[1] *A Book of Essays*, p. 141.

[2] Cf. art. Liberal Judaism.

with man—the Talmud must be conceded a high place.

In the main, then, the Talmud retains its worth because it has so thoroughly absorbed the prophetic conception of the close interconnexion of religion and life. But life is not altogether expressible in terms of conduct. There is the intellectual side. Now, for long intervals, the Talmud was the main means by which the Jew cultivated his mind. Some of the greatest Talmudists of the Middle Ages were indeed also devoted to science and philosophy, in the technical sense of those terms. But there were masses of Jews who knew no other intellectual interest than the Talmud and the allied literature. The nature of the Talmud saved them from stagnation. For the Talmud is a work of most manifold interest. It concerns itself with every phase of human activity. To read it intelligently—and it was assuredly so read—was a liberal education in the arts and sciences and philosophies. So wide is its range that a student of the Talmud is perforce acquainted with very many subjects which nowadays are regarded as distinct disciplines. The mind of the student was kept alert; his attitude never became scholastic; at every point he was in contact with actualities. It was an essential function of the Talmud to maintain this alertness, so that to con over its pages was not identical with losing oneself in an obsolete past. The Talmud breathes with vital freshness.

This enables us to understand why the Talmud has never been superseded by the codes founded upon it even by authorities so competent and able as Moses Maimonides and Joseph Qaro. The codes omit the very element which makes the Talmud so important, so unique. The codes reduce ritual and religious conduct to rule; the decisions are stated in precise paragraphs; they are anonymous. But the Talmud presents processes as well as results; there is little of rule in it, less of precision; and the dicta are largely associated with the names of their authors. We see the religious evolution in action. And, just as it is in action in the older book, it remained in action in the modern life. The claim often put forward by recent Talmudists that their beloved tomes represent a progressive Judaism is well founded. Codes have an air of finality, while the key-note of the Talmud is continuity.

For the Talmud, after all, comes into line with the newer theory of the evolution of religion. The effect of the Talmud, it has been said, was to obscure the difference between Scripture and Tradition. This may be true, but modern criticism tends (on quite other grounds) to obliterate the distinction. The Scripture is itself a traditional evolution—so the newer theories hold. The Talmud in essence anticipated this theory, not in the direction of belittling the divine character of the written text, but in the direction of magnifying the human part in the authorization of the message. Man has his part to play in bringing the Law into operation—in interpreting it, which is often another term for expanding it.

We can here merely mention the beauties of the Talmud, its felicities of thought, its flights of fancy, its parables, its poetry. The Jew did not merely feed his mind on the wit of the Talmud or his spirit on its idealism. His heart and imagination found their nourishment there also. From its pages the liturgy derived some of its choicest prayers. In germ, the Talmud already contains the mysticism which in later ages grew up so luxuriantly in Judaism. That this mysticism rarely became antinomian was due almost entirely to the Talmud, which more than permitted—for it encouraged—individualism as well as communism in the religious life. Our present point, however, is that volumes could be compiled (volumes have been compiled) out of the fine gems presented in a literary form which is unlike that of any other work—unlike in grotesqueness as well as in efficiency.

In the presence of these merits the attacks on the Talmud failed. Partly they were theological, partly moral, partly social. Ridicule was cast on its trivialities; fault was found with its religious conceptions; objection was taken to its attitude to Gentiles. These unfavourable criticisms were not all unfounded, for the Talmud contains much of inferior value, and bears the marks of the different ages and strata of thought in which it grew up. Nevertheless, some of the attacks on the Talmud were absolutely false; in others the assailants confused the attitude towards the Rome which destroyed the Temple with the attitude to the Rome which became the seat of the papacy. Often, too, overmuch importance was attached to the *obiter dicta* of isolated Rabbis. When, however, it was protested by Donin in 1239, and by Romano in 1553, that it was the Talmud that confirmed the Jews in their obstinate fidelity to the Synagogue, the charge was largely just. But that must be assigned to the Talmud as a merit, not as a fault. At all events it explains, perhaps in the most effective manner, how it came about that a work, so curiously alien from the modern canons of excellence in literature, has maintained its position not only with those Jews who more or less order their lives in accordance with it, but also with those who, rebels against its authority, retain an affectionate regard for its spirit. Written in style far removed from modernity, the Talmud is one of the most modern of books.

LITERATURE.—S. Schechter, in *HDB* v. 57–66, with full bibliography; W. Bacher, in *JE* xii. 1–27 (also with bibliography); H. Graetz, *History of the Jews*, Eng. tr., London, 1891–92, ii. chs. xiii.–end, and elsewhere in passages indicated in detail in the Index volume (1898) to the American ed. of the translation, p. 589 ff. The well-known unfavourable view of Schürer is contained in his section on 'Life under the Law,' in his *History*, Eng. tr., II. ii. § 28. An account of the Talmud is given in I. Abrahams, *Short History of Jewish Literature*, London, 1906, ch. iii. Special attention may be drawn to the brilliant essays of E. Deutsch (*Literary Remains*, London, 1874) and J. Darmesteter (*Reliques scientifiques*, Paris, 1890).

I. ABRAHAMS.

TAMIL-SPEAKING PEOPLES.—See DRAVIDIANS.

TAMMUZ.—Tammuz was the West Semitic form of the name of the great Asiatic nature-god, typifying the changing seasons in their relation to man's needs, desires, and passions, though the last-named were far from being so pronounced in connexion therewith as the other two aspects. For its meaning, and also other names of Tammuz, see §§ 7, 10, below.

1. **The old view of the legend of Tammuz.**—Prior to the successful reading of the Assyro-Babylonian inscriptions the legend of Tammuz was regarded as being exclusively West Semitic, owing, apparently, to the scene of the god's activities being located, in the then extant records, in Syria. There was considerable difficulty, however, in finding an acceptable root by which the name of the god might be explained.

2. **Its most familiar versions.**—According to the classic legend of Tammuz, his mother had unnatural intercourse with her own father, urged thereto by Aphrodite, whom she had offended. Pursued by her father, who sought to kill her for this crime, she prayed to the gods, who changed her into a tree, from whose trunk Adonis (the Græco-Syriac name of Tammuz) was in due time born. So charmed was Aphrodite with the beauty of the infant that, placing him in a chest, she

handed him to Persephone to take care of. The goddess of the under world, however, when she found what a treasure she had in her keeping, refused to part with him again. Zeus was therefore appealed to, and he decided that for four months in the year Adonis should be left to himself, four should be spent with Aphrodite, and the remaining four with Persephone. A variant account, however, agrees with the Babylonian legend in making him pass six months with Êreš-ki-gal (Persephone) and six with Ištar, or Aphrodite. The classic versions represent Adonis, or Tammuz, as being passionately fond of hunting, and undeterred therefrom by the fiercest quarry. His end was tragic, as he was slain through the tusk of a wild boar piercing his groin (see § 14).

3. The Syrian versions.—The centre of the Syrian worship of Tammuz was probably Gebal; in any case, Balthi ('the [divine] Lady,' as Aphrodite seems to have been called in the extreme west of Asia) was believed to have migrated thither from her realm of Cyprus for love of Tammuzo (Tammuz). But before Tammuzo she had loved Ares (Mars)[1] and thereby aroused the jealousy of her husband Hephæstus. In this version Tammuz is described as the son of Cuthar, king of the Phœnicians, to whom, when she fled from Cyprus, Balthi made all the villages around subject. It was not the irresponsible act of a wild boar, however, that caused the death of Tammuz, but the jealousy of either Aphrodite's husband Hephæstus or her lover Ares, who came and slew Tammuz on Lebanon whilst he was hunting wild boars.

The Syrian lexicographer Bar Bahlul also gives the legend as he had heard it: 'Tomuzo was, as they say, a hunter shepherd and chaser of wild beasts; who when Balathi loved him took her away from her husband. And when her husband went forth to seek her Tomuzo slew him,' but was himself slain later on by a wild boar which he encountered in the wilderness, and his father made a great weeping for him in the month named after him.

The Rabbinical references to Tammuz are more curious than instructive with regard to the history and development of the myths concerning him.

One (that of Rabbi Solomon Isaaki, or Rashi), commenting on Ezk 8^{14}, in order to connect the root of the name Tammuz with the Chaldæan *azα*, 'to make hot,' describes it as 'an image which the women made hot in the inside, and its eyes were of lead, and they melted by reason of the heat of the burning, and it seemed as if it wept; and they (the women) said, "He asketh for offerings."'

This and other varying traditions concerning Tammuz, however, seem to belong to the Christian era.

4. The worship of Tammuz in Syria.—In all probability the mourning for Hadadrimmon mentioned by Zechariah (12^{11}) is a reflexion of the lamentations for Tammuz, with whom this deity is said to have become identified; and in a passage in Amos (8^{10}) the Israelites lament as for 'an only son.' The most noteworthy Biblical passage, however, is seemingly that in Jeremiah (22^{18}), where it is said that they shall not lament for Jehoiakim, saying, 'Ah my brother! or, Ah sister! Ah lord! or, Ah his glory!' and where the word 'sister' suggests the sympathy of the mourners for his bereaved spouse or lover. When Belili, his sister, in the Babylonian legend, says, 'My brother, only (one), do not cause me pain'[2] (by leaving the world again to go to the regions below), we have perhaps a better parallel. Byblos, the Biblical Gebal, was the centre of the worship of Tammuz in Syria, where, in the month of June, the funeral-festival of the smitten sun-god was held, and lasted for seven days. 'Gardens of Adonis'—flower-vases planted with seeds which sprang up quickly, and as quickly, owing to lack of moisture, faded away—were prepared by the mourning women as emblems of the early death of the youthful Adonis. Throngs of wailing women filled the streets and the gates of the temple, tearing their hair, disfiguring their faces, and gashing their breasts. The Galli—emasculated priests of Ashtoreth, the spouse of Tammuz—took part in the mourning for 'the bridegroom of her youth.' These days of mourning were followed by days of rejoicing for his resurrection, during which a papyrus-head came over the waters of the Mediterranean from Alexandria—an emblem of the severed limbs of Osiris, which, gathered up by Isis, his inconsolable spouse, after he had been dismembered by Typhon, had of old arrived at Gebal. Thus did the legend of Tammuz assimilate itself with the Egyptian myth of the sun-god Osiris.

5. Tammuz in Babylonia, his birth-place.—So far Babylonian sources have furnished but few of the details of the Syrian and the Greek versions of the myth of Tammuz. To all appearance the legend had not been carried from Syria to Babylonia, as might be expected, but the reverse. In its original form it must have been of considerable antiquity. According to the archaic list of royal names[1] discovered at Nippur (*Niffer*), and now preserved in the museum of the University of Pennsylvania, Dumu-zi, as the Babylonians called Tammuz, was a king of Erech and ruled for 100 years. His predecessor was the god Lugal-banda, who reigned for no less than 1200 years, whilst his successor was the half-divine and only half-historical king of Erech Supuri, Gilgameš, who ruled for 160 or possibly 180 years. According to this record, Tammuz was a fisherman (Sumerian *šu-ḫa*) of the city Ḫa-a, a site as yet unidentified, but which one would expect to find somewhere in the neighbourhood of the Persian Gulf. Though king of Erech, Tammuz was more especially associated with Êri-du, the divine city of Êa, the god of the waters, at the head of the same waterway, and it was only natural that a maritime people, such as the southern Babylonians were, should make Tammuz a fisherman. In that part of the land he was evidently the god of the fruitfulness of the teeming waters, just as, inland, he was god of the fruitfulness of the fertile Babylonian plain.

6. Ištar's search for Tammuz in Hades.—Outlines of this legend are given in the articles BABYLONIANS AND ASSYRIANS[2] and HEROES AND HERO-GODS (Babylonian).[3] From this text we see that Tammuz was, at the time of Ištar's descent, in the under world with Êreš-ki-gal (Persephone), whither he had descended in accordance with the decision of the king of the gods (Bel-Merodach = Zeus). This legend likewise shows that Tammuz had become the lover of Ištar, or, as the record puts it, 'the husband of her youth.' The sacrifices which she was willing to make on his account are noteworthy, for at each of the seven gateways of 'the land of No-Return' she parted—under protest—with an article of apparel or adornment, until she appeared in the presence of the queen of the region perfectly naked. As things went wrong on earth owing to the absence of the goddess of love, Šamaš, Sin, and Êa bestirred themselves and secured her release. Here the subject suddenly changes, and the name of Tammuz appears in the text for the first time:

'If she [Êreš-ki-gal] hath not given thee her dismissal, return to her.
Upon Tammuz, the husband of [her] you[th],
Pour out pure water, [sprinkle] sweet oil.

[1] Mars is probably to be identified with the Bab.-Nergal rather than with Ên-urta (Ninip). The former was the spouse of Êreš-ki-gal (Persephone). (See § 10 below.)
[2] See § 6 below.

[1] See *ExpT* xxvii. [1915–16] 519ᵃ.
[2] *ERE* ii. 315ᵇ. [3] *Ib.* vi. 645ᵃ.

Clothe him with a festive garment, let him strike up with the flute of lapis-stone—
Let the joy-maidens dance, [let] the honoured one . . .
[Then] Belili set [down] her instrument,
[And] "eye-stones" filled [her] la[p?]—[1]
[When] she heard her brother's voice, Belili smote her instrument . . .
Her "eye-stones"[2] filled [her] thoughts (?).
"My brother, only (one), do not cause [me] pain (?)."
On the day Tammuz plays on the lapis-flute, they will play along with him the tambour of chalcedony (?).
The men-mourners and the women-mourners will play along with him.
May the dead (?) arise and smell the incense.'

Belili, mentioned here as the sister of Tammuz, appears also in the great list of gods[3] in connexion with Alala, as forms of the deities of the heavens, Anu^{m} and Anatu^{m}. The flute of Tammuz, like the divine vine at Êridu, was of lapis-stone, emblematic of the blue sky, and it is not unlikely that the other objects mentioned—Belili's 'eye-stones' and the 'tambour'—were of precious and similarly symbolical materials.

7. Other Babylonian references to Tammuz.—The first place ought probably to be assigned to the lists of gods, which furnish us with some of his names, and the deities with whom he was identified. The transcription of the group standing, in Sumerian, for Tammuz is 'Dumu-zi,' though a longer form, 'Dumu-zida,' is often found. The commonly accepted rendering of this group into Semitic Babylonian is *mâru kênu*, 'the true (or faithful) son.' Of the lists in which the name is found the most important is probably the trilingual text (two dialects of Sumerian and Semitic Babylonian equivalents) published in *WAI* ii. pl. 59. In that inscription his character as a sun-god is indicated by the fact that his name comes towards the end of the section referring to the sun-god Šamaš, after Kêttu and Mêšaru, that deity's two attendants.[4] After this comes Ṭu-zi-zi (? from Ṭumu-zi), in standard Sumerian [Dumu]-zi, rendered by *šu-ma—i.e.* transferring Dumu-zi into the Semitic Babylonian column—and from the next line we see that he bore in Sumerian also the name of U-libir-si (dialectic) or Enligir-si, probably meaning 'the lord of the righteous covenant,' or the like. The next line, which begins a new section, has the name of Sir-du, dialectic Ṣir-ṭumu, the mother of Tammuz. Other deities in this section are 'the lady of the plain,' Ištar, and 'the lady of the gods.' A section giving further names of these goddesses follows, and then comes the final section of the tablet, beginning with Ereš-kigal and explaining her as Allatu^{m}, the Babylonian Persephone. Important as showing the feminine aspect of Tammuz, which is also visible in the Syro-Greek view of the deity, is the list[5] in which he is called Ama-ušumgal-ana, 'the peerless mother of heaven,' which may be one of the aspects of the planet Venus, described[6] as 'male at sunrise.' Another name, En-mersi, dialectic for Nin-Girsu, the god of Lagaš, identifies Tammuz with that deity and stamps him specifically as the great god of agriculture.[7]

8. The abodes of Tammuz in Babylonia.—The chronological list preserved at Philadelphia, U.S.A.,[8] makes Tammuz a king of Erech and seems to indicate that his native place was a city expressed by the characters Ḫa-a. In the incantation published in *WAI* iv. pl. 15, however, Êridu seems to have been his chief city, of which, therefore, Ḫa-a may have been a suburb or even another name:

'In Êridu a black vine grew—in a sacred spot it was made.
Its substance was white-flaked lapis-stone, planted in the Deep.
Êa's path in Êridu is filled with fruitfulness—
His seat is the [central] place of the earth.
His abode is the bed of Engur [the Abyss].
In his holy house, which is like a forest, [his] shelter is set—no man can enter therein.
In the midst of it is Šamaš [and] Tammuz [Dumu-zi],
Between the mouths of the rivers [or canals] on both sides.'

Here follow the names of the waterways in question: Ka-ḫengala, Igi-ḫengala, and Ka-na-ab-ul, though the true total seems to have been four.[1]

Instead of 'the god Šamaš (and) Tammuz' we might read 'the sun-god Tammuz,' which would correctly describe his position in the Babylonian pantheon. The Sumerian original has expressed the name of Tammuz by the feminine Ama-ušumgal-ana.[2] The connexion of Tammuz with the vine of Êridu, the Paradise-city, stamps him here likewise as one of the gods of fertility, and it is owing to this that he is so closely connected with the god Êa, to whose nourishing streams the great fruitfulness of the land was due. It is noteworthy that Nin-Girsu, the god of Lagaš, who was identified with him, bore also the name of Uru, 'the husbandman.'[3]

9. Tammuz as the herdsman.—It has already been noted that Dumu-zi, or Tammuz, was called the fisherman (*šu-ḫa = bayaru*), but later he appeared as 'the herdsman.' This view of the deity is referred to in another incantation:

'The milk of a yellow goat which has been brought forth in the holy fold of Tammuz [Dumu-zida]—
The milk of a goat of the flock—may he give thee with his holy hand.
Pour it then into the skin of an undefiled she-goat.
Azag-suga, the uz-maḫ-Enlila ['glorious goat of the god Enlila'], has caused [it] to be eaten with his sacred hand.
Merodach, son of Êridu, has given the incantation—
May Nin-aḫa-kuddu, the lady of the limpid fountain, make him [the sick man] holy, make him pure.'[4]

'The incantation of the milk of the yellow goat, and the flour of the undefiled she-goat's skin.'

The antiquity of the association of Tammuz with the flocks in Babylonia is shown by the noteworthy text in *The Amherst Tablets*, i. (London, 1908) no. 119, where 'fleece' is expressed by the phrase 'sheep of the sky.' This indicates that the flocks of Tammuz, the sun-god of spring, were the clouds illuminated by the setting sun, and comparable with the flocks of Helios in Greek mythology. In the same publication, nos. 110, 112, and 114 refer to the 'grain of the priest of Tammuz,' and no. 118 mentions his temple at Lagaš. The date of these inscriptions is about 2300 B.C.

10. The Babylonian hymns to Tammuz.—At least two series of these existed, and they may have formed the originals of some of those chanted by the Hebrew women[4] as well as by the Phœnicians and the other nationalities who accepted or adopted the cult. The following will show their nature:

'The ewe and her lamb he taketh;
The goat and her kid he taketh.
The ewe and her lamb he smiteth down;
The goat and her kid he smiteth down.

Arise then, go, hero, the road of "No-return."
Alas, hero! warrior, Un-azu;
Alas, hero! hero, my god Damu;
Alas, hero! son—my faithful lord;
Alas, hero! Gu-silim the bright-eyed;
Alas, hero! god Nagara, lord of the net;
Alas, hero! overseer, lord of prayer;
Alas, hero! thou who [art] my heavenly light;

[1] Probably poetically put for some such idea as 'Crystal tears filled her body'; see below.
[2] Probably 'crystal tears'—evidences of the grief she had felt when Tammuz descended into the under world.
[3] *Cuneiform Texts from Babylonian Tablets, etc., in the British Museum*, London, 1908, pt. xxiv. pl. 1.

[8] See § 5 above.

[1] See *ExpT* xxix. [1917–18] 182 f., 288.
[2] See § 7 above.
[3] Tammuz visited not only the under world, but also 'the heaven of Anu'; see *ERE* vi. 644^{a}.
[4] Cf. Ezk 8^{14}.

Alas, hero! Ama-ušumgal-ana;
Alas, hero! brother, mother, heavenly vine.
He goeth, he goeth, to the bosom of the earth—
He will cause abundance for the land of the dead.[1]
For his lamentation, for the day of his fall,[2]
In an unpropitious month of his year.[3]
To the road of man's last end,
At the call of the lord,
[Go], hero, to the distant land which is not seen.'

Or, according to the Sumerian original of the last four lines:

'In an unpropitious month of thy year,
To the road of the people's end [or rest],
At the call of the lord,
The worthy one, in his distant land, is not seen.'

'The unpropitious month' is probably Du'uzu, or Tammuz; 'the road of man's last end' is that leading to the under world; 'the lord,' who calls him, is possibly Merodach, but may be Nergal, king of that region, the Babylonian Mars.[4]

After a division-line the text continues:

'Alas, my abundance which has been withheld! Alas, my produce which has been detained!
My heart is oppressed, shepherd, dwelling in exile—
Where is his city? My heart is oppressed!
From the house of gloom he shall be brought forth—
Thou who art worthy, from the house of gloom thou shalt be brought forth!
Alas, hero! warrior, Un-azu,' etc., etc., as above.

Though these lamentations may have been recited by the women and others who joined in the ceremonies, it is probable that they were originally placed in the mouth of Ištar. The abundance and plenty referred to is probably the fruit of the earth; the oppression of heart was due to the lack of these things, and also to the god's exile in the regions below.

The bearing of these hymns upon the legend is clear. We learn that (1) some accident had happened to Tammuz, by which his sojourn in the under world was brought about; (2) this accident was that in some way he 'fell'—either through an attack by a wild animal (boar) or, like Eshmun, the Phœnician deity, by his own hand; (3) the result was that he passed part of his life in the under world, whereby the earth suffered and the under world profited; (4) the under world, to which Tammuz went, was man's last abode and the place of the people's rest. Notwithstanding that he was fulfilling his mission, the exile of Tammuz was still an unpropitious event for him, the realm of Éreš-ki-gal not being, even for the earth-dweller, that place of delight which the man looking forward to life with his god in the realms of bliss would like it to be. It may be supposed, however, that the worshipper of Tammuz, when he departed this life to dwell with his god, hoped to enjoy companionship with him not only in Hades, but also on earth when his time came to return thither.

11. The transfer of the legend to Syria.—As has already been stated,[5] the legend of Tammuz in Babylonia was of considerable antiquity—as early, in fact, as 4000 B.C. or even earlier, and it had had, therefore, ample time not only in which to spread abroad, but also to assume new forms and receive additions. Besides Byblos, the Babylonian Gublu (Gebal), Tammuz was also venerated in many intermediate states and cities — Cilicia, Cappadocia, Lycia, Lydia, Ephesus, and Pterium. Everywhere the cult was most enthusiastically adopted, falling in, as it did, so exactly with the Semitic view of the nature of things. Apart from the theories which were held as to the creation of the universe, the legendary teaching connected with Tammuz dealt only with the continuance of what had been brought into existence by the Creator. Regarded as a sun-legend, it was recognized that 'the kindly fruits of the earth' were due to his rays, and to the fact that, when these and their accompanying warmth were withdrawn or reduced, the growth of vegetation ceased.

12. The reflex-influence of the legend of Tammuz in Babylonia and Assyria.—That this enthusiastic worship of the Babylonian Dumuzida, under the name of Tammuz, had influence in Babylonia and Assyria, sympathetically related as they were with the Western Semites, is but natural; and its greater importance in the countries of its adoption than in the land of its origin is also easily comprehensible. This was due to the fact that the Babylonians had, from the date of the rise of Babylon, accepted Merodach, who was also a sun-god, as their supreme deity. Tammuz therefore continued to represent simply one of his forms, and thus remained ineligible as chief of their pantheon, whose construction, as a philosophical system, his position of supremacy would have destroyed.

13. The development of the legend farther west.—In all probability more than one version of the legend anciently existed in Babylonia and migrated, with the worship, westwards. Representing the summer sun, with all its warmth and its vivifying and productive power, Tammuz was regarded as the god who passed the six months between the beginning of autumn and the end of winter in the under world. As the planet Venus seems to follow the course of the sun, her disappearance with him was interpreted as due to her desire to rescue him from that prison-house, but, as her movements do not coincide with the seasons, she generally had to come forth without him. When the time for his release came, therefore, he had to return to earth unaccompanied by his spouse.

In the West the legend was modified, and Tammuz-Adonis there appears as the son of the Cypriote king Kinyras and as beloved of the goddess Aphrodite. He died, it was said, in the forest of Lebanon, killed by the wild boar typifying winter; and since the time of that catastrophe the river Adonis, now the Nahr Ibrahim, 'Abraham's stream,' flows yearly, when in flood, reddened by his blood. The name Adonis is the Greek form of the Phœnician Adōn, 'lord,' which this deity, in common with many others, bore. In the Sumerian hymns (mostly in the dialect) he is constantly called the 'lord,' *un* or *uwun*, and it is probably owing to this, at least in part, that Adōn (Adonis) became one of his names.

14. Tammuz in Cyprus.—According to Ovid,[1] the scene passes, in part, from Assyria (Syria) to Cyprus. Kinyras, king of that island, had, by an incestuous relation with his daughter[2] Myrrha, a beautiful son named Adonis. The child was brought up by the nymphs and had hardly reached manhood when he became the lover of Aphrodite. One day, notwithstanding the goddess's supplications, he went hunting in the forest of Lebanon and was wounded by a boar sent by Ares (Mars), who was jealous of the divine youth. Aphrodite, hearing of this tragedy, filled the forest with her lamentations and tried to revive him, but without success. From the blood of the dying Adonis the anemone had its birth, and the river Adonis was thenceforth reddened yearly by his blood.

15. The legend of Tammuz in Greece.—According to Panyasis (5th cent.), Adonis was the son of a princess of Assyria (Syria), Myrrha or Smyrna,

[1] Variant rendering: 'Šamaš will make him great in the land of the dead,' but that given above seems preferable.

[2] The full rendering in Semitic is 'Filled with lamentation on the day that he fell and (was) in distress,' but the Sumerian is insufficient for all this.

[3] In the calendar of lucky and unlucky days (*WAI* v. 48) the entries for the month Tammuz (col. iv.) include 'weeping' on the 2nd day, and 'lamentation' on the 10th, but it is doubtful whether these really refer to the legend.

[4] See § 3 above, and § 14 below.

[5] § 6 above.

[1] *Metam.* x. [2] See §§ 2, 15.

whom Aphrodite had inflamed with a violent love for her father Theias. Myrrha profited by her father's drunkenness and the darkness, but, when afterwards Theias found out what had taken place, so violent was his anger that he attacked his daughter, sword in hand. Myrrha fled, praying the gods for protection, and the divinities who had been the cause of her ruin, recognizing that she was not really to blame, changed her into the tree which, since that time, has borne her name. Nine months later the tree opened and gave birth to the beautiful Adonis. Aphrodite took charge of him and, placing him in a casket, handed him to Persephone to take care of.

Other variants of the legend of Tammuz are recorded, but, as they are apparently later developments and seem not to bear upon the origin of the myth, it is needless to speak of them here. How far the above or any other variants may be founded upon further details from Babylonia is uncertain and will not be known until the Babylonian legend of Dumu-zida comes to light.

16. Why did the legend vary?—Not only was Tammuz faithful in fulfilling his fate and passing a part of his existence in the under world, but he was also faithful in bringing, as the god of agriculture, the fruits of the earth to perfection in their season. The climates of Babylonia and of Syria are so different that any legend common to both was bound, in its province, to differ; hence the variations in that of Tammuz noted here. According to G. Rawlinson,[1] increasingly heavy showers fall in Babylonia, in November and December, raising the river-levels. As spring advances, the showers become lighter and fewer until about May, when summer-weather arrives. From May to November rain is very rare indeed, and the sun's rays are only tempered at morning and evening by the grey mist. For five months, therefore, Babylonia is a land of drought. With this description the month-list of Lagaš, whose principal deity was Nin-Girsu — identified with Tammuz—seems to agree,[2] but it is the common calendar of later days[3] that is the most instructive. In this it would seem that it was the fourth month, Šu-(n)umuna, 'perfection of seed,' or the like (June–July), that ended the time of productiveness, and that this month was called Du'uzu, the West Semitic Tammuz, as the month of the god's greatest fruitfulness. The month next following, Bibi-gar, apparently means 'making heat' (=Heb. Ab), whilst the 6th month, August–September, is Kin-Innanna, 'the errand of Ištar,' generally regarded as that in which Ištar descended to Hades in search of her lover. Its Heb. name Elul (in Babylonian, Ululu) probably means 'grief' and seems to express the common Semitic sound of mourning and distress. In Marcheswan, the 8th month, the opening of the water-channels took place and was succeeded by the rain-clouds of November–December (the Heb. Chislev). The 11th month, January–February, was 'the month of seed' and probably marks the time when sowing became general. Finally came the 1st and 2nd Adars (Feb.–March), in Sumerian Še-gur-kud and Dir še-gur-kud, the two grain-plant cutting months, when the seedlings were cropped to encourage the increase of sprouts.

Roughly, the 12 months of the year fall into three groups of four each, Nisan to Tammuz marking the growth and perfection of the grain, Ab to Marcheswan practically barren owing to the great heat, and Chislev to Adar the season of irrigation by the rivers and the sprouting of the crops. It is probably to this that the three periods of the year of Tammuz—with Ištar, with Ereš-ki-gal or Persephone, and at his own disposal—are due, the division of his year into two periods of six months each being apparently Western.

17. Tammuz in the late Assyrian inscriptions.—In these documents there are certain names which testify to the popularity of the god—not, however, under the name of Dumu-zi or Tammuz, but under that of Adōn. The Assyrian form appears as Adunu, and the names containing it may be divided into the specifically Syrian and the Assyrian—the latter apparently imitations, or translations from Syrian into Assyrian. Among these are Adunu-apla-iddina, 'Adōn has given a son'; Adunu-nadin-apli, 'Adōn, giver of a son'; and Adunu-mâta-uṣur, 'Adōn, protect the land.' The purely Syrian names seem to be Adunaiz(i) or Aduna-iz(i), perhaps 'my lord hath sprinkled'; Aduni-ṭu and Aduni-ṭuri, 'my lord is my rock' (Heb. *ṣûr*); Aduni-iḫa, 'my lord liveth (?).' Aduni-ba'ali, 'Adōn is my lord,' is West Semitic and belongs to about 850 B.C. (he was king of Sianu), but all the rest fall between 680 and 660 B.C.

Whether, with Vellay, the gods of the countries into which the worship penetrated may be regarded as having become identified with Tammuz or not is doubtful. If correct, it was due to the fact that Tammuz, under the name of Adōn, 'lord,' was designated by a word which could be applied as a title to any god, whether the Merodach of the Babylonians, the Moloch of the Syrians, or the Hadad of the Amorites. It is this, in all probability, that caused Tammuz to become, in a measure, identified with the Adonai of the Hebrews—that more general divine name which, with them, replaced the all too sacred Jahweh (Jehovah) of their own monotheistic creed.

18. The Tammuz-cult and its contemporary creeds.—Naturally, the idea of a kind of martyr-god, dying, it may be, for the good of mankind, notwithstanding the difficulty of bringing Tammuz into this category, has to be taken into consideration. The most striking parallel, perhaps, is the Osiris of the Egyptians; and the Babylonian Merodach, who died in order that mankind might be produced from his divine blood, is equally noteworthy. As Merodach, the 'steer of day,' was a sun-god, it is not unlikely that he was regarded as dying daily and as being reborn that men might live. The sun as Tammuz, however, died yearly, not so much that men might live, but because he fell under the evil influences of the spouse of Nergal, the god of battle, disease, and untimely death. Vellay contends also that Jesus Christ, like Tammuz, was a sun-god and, also like him, descended into Hades; but there are so many fundamental differences in the career of the mythical sun-god of 4000 or 5000 years B.C. and the Christ of history that comparisons may well be set aside. The half-mythical Babylonian ruler, with his 100-year reign, comparing so unfavourably with his predecessor's 1200, may easily have had a misadventure in the hunting-field which gave birth to the nature-myth which the Babylonians, Syrians, and Greeks have handed down to us.

TANJORE.—1. History.—Tanjore (Tamil Tanjāvūr, 'city of refuge') is the capital of the District of the same name in the eastern portion of the Madras Presidency; it is situated in 10° 47′ N. lat., 79° 8′ E. long.; in 1911 the population was 60,341. The District formed part of the ancient Chola country, and the kingdom reached the zenith of its power under Rājarājā I. (A.D. 985–1011). During the 13th cent. it passed under the rule of the Hoysala Ballālas of Dorasamudra and the Pāṇḍyas of Madura. An independent Nāyak dynasty was established in the 16th cent., which was displaced by a Marāṭhā kingdom about 1674. It was occupied by the British in 1773 and finally ceded to them in 1799; the royal family, who were pensioned, became extinct in 1885.

2. The temple.—Tanjore owes much of its importance to the great temple built by King Rājarājā I., who was a devoted Śaiva, but tolerant of other religions. It is known as Brihadīśwara, Brihatīśwara, said to mean 'temple of the great god,' or Rājarājīśwara, after its founder. Fergusson writes:

'In nine cases out of ten, Dravidian temples are a fortuitous aggregation of parts, arranged without plan, as accident dictated at the time of their erection. . . . The one great exception to this rule is to be found at Tanjore. The Great Pagoda there was commenced on a well-defined and stately plan, which was persevered in till its completion.'[1]

Entered by a fine gateway (*gopuram*), which is supposed to cast no shadow on the ground, the outer court, used as an arsenal by the French in 1772, is 500 ft. long and 250 broad, and is surrounded on all sides by a cloister. The main shrine stands to the west, and above it rises to a height of about 200 ft. a magnificent tower, decorated with pillars and statues. The summit is crowned by a single block of granite, weighing 80 tons, said to have been raised to its present position up an inclined plane commencing at a village four miles distant. An interesting feature of the tower is that the carvings are generally of a Vaiṣnava type, while the ornamentation of other parts is Śaiva. Another curious fact is that one of the figures on the north side of the tower represents a European; the popular belief is that it is the figure of a Dane who assisted in the building or that it was erected to foretell the British occupation. It is probable that both the European figure and the Vaiṣnava ornamentation were erected by one of the Nāyak princes, and that he was helped by some Danes who acquired Tranquebar in 1620. The base of the great temple and many of the other buildings are covered with inscriptions which have been translated;[2] nearly all of them belong to Rājarājā and his successors.

Another noteworthy building is the temple of Subrahmanya, god of war, younger son of Śiva,[3] with a colossal figure of Nandi, the bull of Śiva, 'a perfect gem of carved stone-work, the tooling of the stone in the most exquisitely delicate and elaborate patterns is as clear and sharp as the day it left the sculptor's hands.'[4]

'The temple, though beautiful, is not considered particularly sacred. The legendary cause of this is that the Śaivite saint Appar was refused admission to it, and that therefore it was not celebrated in his hymns or those of the other three Śaivite poet-saints. A peculiarity about it is that Śūdras are admitted to the apartment next the shrine, from which in most temples in this District they are excluded, and that Valaiyans [a hunting, fishing, iron-making, and cultivating caste],[5] who are usually not admitted at all, here come as far as the great bull.'[1]

3. Tiruvādi.—Tiruvādi (Tiruvaiyāru, 'the five holy rivers'), six miles N.W. of Tanjore, is a place of great sanctity, said to be holier than Benares by one-sixteenth, where pious Hindus desire to die and where their bones are cast into the river. It has a fine temple, called Pañchanadīśwara, 'Lord of the five rivers,' which contains inscriptions of Rājarājā and his successors.[2]

LITERATURE.—The authorities have been quoted in the article. For the early Tamil history see V. Kanakasabhai, *The Tamils Eighteen Hundred Years Ago*, Madras, 1904; G. Oppert, *The Original Inhabitants of Bhāratavarṣa or India*, London, 1893.

TANNAIM.—See JUDAISM.

TANTRAS.—In the series of sacred books of the Hindus the *Tantras* occupy the fifth or sixth place. According to their character and contents they are fourth in the order of inspiration and authority, the degrees being *śruti*, *smṛti*, *Purānik*, and *Tāntrik*. They are also known as a fifth or the fifth Veda by those who regard them as authoritative and observe the ritual which they enjoin. In neither case is the series entirely chronological or consecutive. The *Tantras*, which succeed and are in part dependent on the *Purāṇas*, are also in parts unrelated to the latter and of greater antiquity. Their date, however, it is impossible to determine with any precision. The existing treatises are probably for the most part at least reproductions with additions and variations of older works which are no longer extant. In their present form they are usually ascribed to the 6th or 7th cent. of our era, but they may be considerably later. Tāntrik usages and popular formulas were current and practised in a much earlier age; they belong to a type of thought that is primitive and among primitive peoples varies little in the course of the centuries. Until recent years little was known of these works outside of India. A few have now been made accessible in translations, but the greater number are as yet unexplored.

The name *tantra* signifies a 'web' or 'warp,' then a continuous or uninterrupted series, and in religious usage an orderly rule or ritual. The word was then further applied to the doctrinal theory or system itself, and finally to the literary work or treatise in which it was set forth. In the last sense the word is not found in the *Amarakośa*, the great Sanskrit dictionary,[3] nor is it used by the Chinese pilgrims. The *Mahābhārata* also contains no reference to the *Tantras* or to any religious system founded upon them. All these facts are confirmatory of the comparatively late origin of the existing books. Śaṅkara enumerates the titles of 64 *Tantras*, comparatively few of which can be identified at the present day. The best-known of these treatises and the most worthy of study are perhaps the *Tantrakaumudī*, *Śaktisaṅgama*, *Rudrayāmala*, *Kālikā*, *Kulārṇava*, *Tantratattva*, and *Mahānirvāṇa*. Translations of the two last have been published by Arthur Avalon. Parts of the *Hitopadeśa* also are known as '*tantras*.'[4]

Traditionally the authorship of these works is attributed to Dattātreya, who was an incarnation of the Hindu trinity, Brahmā, Viṣṇu, and Śiva.

[4] For further titles see Monier-Williams, *Sanskrit Dict.*, *s.v.*, and *Brāhmanism and Hindūism*[4], p. 207.

They are therefore to be regarded as equally the revelation of the three supreme divinities. In form, however, they are dependent on Śiva alone, who in dialogue with his wife Durgā, or Kālī, reveals the mystical doctrines and observances which are to be received and practised by his worshippers. This authoritative or 'higher tradition' is further said to have been delivered from his central or fifth mouth. As such it is pre-eminently sacred and secret and may not be revealed to the uninitiated. 'The Vedas, the Śāstras, and the Purāṇas are like a common woman, but this mystical Śaiva science is like a high-born woman,'[1] and its communication is forbidden. The real authors of the several treatises are unknown. They bear the name also of *Āgamas*, and as such are sometimes distinguished from *Nigama*, the text of the *Vedas*, *Dharmaśāstras*, and other sacred books. The Indian commentator, Kullūka Bhaṭṭa, asserts that revelation (*śruti*) is two-fold, Vaidik and Tāntrik.[2] In the popular knowledge and belief they have practically superseded the *Vedas* over a large part of India, where religious practice and ritual are guided by the teaching of the *Dharmaśāstras*, *Purāṇas*, and *Tantras*. A native writer and exponent of these works in Bengal asserts that 'two-thirds of our religious rites are Tāntrik, and almost half our medicine.' They are the *Śāstras*, the scriptural authority and rule for the present age, the *kaliyuga*, and it is therefore incumbent on all orthodox Hindus to follow their directions.

In particular, the *Tantras* are the religious textbooks of the Śāktas and of their various sects. There are different Tāntrik schools, with variant traditions, the distinctions between which are little understood outside of their immediate circle of adherents. The ritual of the *Tantras* of the Dakṣināchārins, however, is said to be pure and in harmony with the *Vedas*, while that of the Vāmachārins is intended only for Śūdras. Their influence unquestionably extends far beyond those who profess to accept their authority. Wilson quotes a passage from one of these treatises which claims that 'many a man who calls himself a Śaiva or a Vaishnava is secretly a Śākta, and a brother of the left-hand.'[3] Even the Jains of N. India are said to have adopted formulæ and ritual from the *Tantras*, and the Lāmaism or corrupt Buddhism of Nepāl and Tibet owes much to the same source.

The teaching of the *Tantras*, as of the *Purāṇas*, is essentially based on the *bhakti-mārga* (*q.v.*), which is regarded as superior to the *karma-mārga* and *jñāna-mārga* of the *Brāhmaṇas* and *Upaniṣads*. Adoration of a personal deity is inculcated, especially of the wife of Śiva, who is worshipped as the source of all regenerative power. In all these writings the female principle is personified and made prominent, to the almost total exclusion of the male. Ultimately their doctrine is derived from the philosophy of the Sāṅkhya-Yoga, with its theory of *puruṣa* and *prakṛti*, with especial emphasis on the mystical side of Yoga teaching and practice. Like the *Purāṇas* also every *Tantra* should theoretically discuss in order five subjects—the creation and destruction of the universe, the worship of the gods, the attainment of supernatural power, and union with the Supreme Being. In reality their contents are almost entirely magical and mystical, but they range over a wide variety of subjects, scientific, religious, medical, speculative, etc., and are interested in all that concerns human need and destiny. One at least of the more important *Tantras* expounds in metaphysical terms the nature of the Supreme Brahman, who is *nishkala* and *sakala*, *i.e.* with or without *prakṛti*, *nirguna*, and *saguna*; in the beginning only the *nishkala* Brahman existed, etc. Great use is made of mystical syllables, *om*, *ām*, *um*, *ūm*, etc., with which sometimes whole pages of writing are filled. By the repetition of these, magical and supernatural abilities may be gained. The use of *mantras* also is enjoined, and numerous examples are given; their essence consists in certain mystical and secret letters or syllables which they contain (*bīja*). The significance of the letters of the alphabet is taught, the employment of mystic diagrams (*yantra*), sacred circles (*śrīchakra*), spells, charms, and amulets (*kavacha*), symbolical movements and crossing of the fingers (*mudrā*), etc.

Together with all this, which appears to us so meaningless and puerile, there is undoubtedly much that is of historical interest in the *Tantras*, and that is of value for the interpretation and interrelation of Hindu doctrine. They are generous and broad in their sympathies, recognize no distinction of caste or sex, 'for men and women equally compose humankind,' and they forbid the practice of *satī*. According to the orthodox view, the rites and doctrine which they inculcate are to prevail until the close of the *kaliyuga*.

A. S. GEDEN.

TĀNTRISM (Buddhist). — A complete study of Buddhist Tāntrism would include the description and the history of its rites, its deities, and its doctrines, practically the *exposé* of the many problems which confront the historian of mediæval India. Buddhist tāntrism is practically Buddhist Hinduism, Hinduism or Śaivism in Buddhist garb. The present writer intends only to provide the reader with a definition of the chief topics.

Buddhists were not quite clear as to the specific meaning of the word *tantra*, 'book.' The Tibetan canon distinguishes the *Sūtra* (*Mdo*) and the *Tantra* (*Rgyud*), but a number of texts are classified in both sections: the limits between *Sūtra* (i.e. *Mahāyānasūtra*) and *Tantra* are not fixed. On the one hand, topics which are essentially Mahāyānist—*e.g.*, hymns to *bodhisāttvas* (*stotra*), resolutions to become Buddha (*praṇidhāna*)—are met with in *Tantra*; on the other hand, *Mahāyanasūtras* include a number of fragments and often whole chapters which would constitute by themselves so many Tāntrik texts.

A good example is found in the *Saddharmapuṇḍarika*, 'Lotus of the true Law,' which contains a whole chapter[1] of *dhāraṇīs*, on talismanic words, invocations in litany form to a female deity or to a female power; 'giantesses' are mentioned as protectors of the *Sūtra* and of its readers. There are good reasons for believing that this chapter is a late addition: such an addition testifies that the spirit of Mahāyāna had become largely tinted with the spirit of Tantrism, or rather that the Tāntrik syncretism made little distinction between Mahāyānism and Tantrism properly so called.

Tāntrik books, by assuming the title of *Sūtra*, secured authority. The *Kāraṇḍavyūha* is styled *Mahāyānasūtraratnarāja*, 'the very best of the Sūtras.' As a matter of fact, the introductory section is written according to the pattern of a *Mahāyānasūtra*; it does not pretend to relate, as

[1] Quoted from Monier-Williams, *Brāhmanism and Hindūism*[4], p. 191.

[1] Ch. xxi.

Tantras do, the dialogue of a god with a goddess; it preserves the old phrase, 'Thus have I heard,' followed by the mention of the place, Śrāvasti, Jetavana, and the description of an audience of *bodhisattvas*. But, when we consider the chief topic of the book, viz. the glorification of Avalokiteśvara as the owner of the 'science in six syllables,' we cannot say that the author has written what we should like to style a *Sūtra*. In many cases the Tibetan scholars were not deceived by mere titles; *e.g.*, although the *Suvarṇaprabhāsa*[1] is styled *Sūtra*, it is not in the *Mdo*, but in the *Rgyud*, that the Sanskrit and the Chinese recensions of this celebrated book are to be found. But the fact remains that *Mdo* and *Rgyud* overlap in a great number of cases.[2]

These confusions or 'overlappings' are accounted for by the fact that a number of speculations, beliefs, and practices which reach their full development in the Tāntrik or last period of Buddhism were not unknown during the former period —*e.g.*, the use of talismanic spells. Again, the Westerns establish a close connexion between the word 'Tantrism' and the worse forms of Hindu (or Buddhist) paganism—magic, theurgy, left-hand worship—and so far they are right, for the magical or left-hand practices are properly Tāntrik, and not to be found in Buddhism outside *Rgyud*; but these practices are not the whole of Tantrism. *Tantra*, with the Hindus as with the Buddhists, covers a large field. We find in the *Rgyud* the texts which are concerned with worship, whether it is 'Tāntrik' worship or Mahāyānist worship, including the building of domestic *stūpas*, the erection and the consecration of idols, the *stotras* or hymns, the daily offering. Worship, with the whole of the religious practices, is a Tāntrik topic. The *Bhadracharīpraṇidhāna*, 'Resolution of Pious Conduct,' is reckoned a *Tantra*, because the recitation of this *praṇidhāna* is one of the daily duties of a Buddhist devotee of the Great Vehicle: from the point of view of the Western definition of 'Tantra,' this text is absolutely non-Tāntrik: it is free from any tinge of idolatry, it breathes the most lofty spirit of the Great Vehicle.[3] Litanies, lists of 100 names, whether of Prajñāpāramitā, Avalokiteśvara, or Mañjuśrī, are also *Tantras*. Litanies may be used for Tāntrik or non-Tāntrik worship. We know that the *Mañjuśrīnāmasaṃgīti*, 'Collection of the Names of Mañjuśrī,' is susceptible of a twofold interpretation: the first is a gnostic or purely philosophical one, the second sees its way to give to the most decent phrases the worst Tāntrik meaning.[4]

Therefore, in order to draw a general outline of the history of Tāntrik ideas in Buddhist literature and life, we must disregard the traditional divisions as embodied in the Tibetan catalogues or the Western theories on the subject, and build a classification of our own.

I. *EARLY BUDDHISM.*—The Old Buddhism, as preserved in the Pāli canon and in the Sanskrit Hīnayāna literature, has a number of features which are not specifically Buddhist, which are alien to the noble eightfold path, which, to put it otherwise, are more or less Tāntrik or open the way to Tantrism properly so called. Let us mention a few topics. (1) There is a general belief in the mystic power of the 'statements of truth';[1] Śākyamuni praises the use of half-magical 'formulas of protection' which have a large place in the more recent Sinhalese Buddhism (*paritrā, paritta, pirit*).[2] (2) In the earliest documents respect is paid to a number of deities or non-human beings who are both powerful and unfriendly; there is an 'orthodox' way of dealing with them, but 'unorthodox' worship is the natural result of fear. Vajrapāṇi is regarded as the 'guardian angel' of Śākyamuni, as the protector of the *avoué* of the Church. He is the pattern of the 'Dharmapālas' of a later age. (3) The worship of relics, the building of *stūpas*, pilgrimages, and idolatry are old features of Buddhism. (4) Last, not least, the earliest machinery of meditation or trance is akin to the more intricate machinery which constitutes the basis of the *Yogatantras*. Buddhist 'meditation' is simply Hindu *yoga* more or less transformed. The 'insight into the truth' (*satyadarśana*), which is the only and the sufficient means to *nirvāṇa*, practically implies (*a*) the meditation on loathsomeness (*aśubhabhāvanā*), when the ascetic, often 'a dweller in the cemeteries,' 'purifies his bones' —*i.e.* fancies that his flesh is rotten and falls, and sees only the bones behind, until the whole world appears to him as full of skeletons—and thus succeeds in crushing desire; (*b*) the restraint of breath (*prāṇāyāma*), counting the expirations and inspirations, in order to render thought more tractable and to direct it towards the Buddhist truths; (*c*) the *vimokṣas*, *abhibhvāyatanas*, and *kasinas*, prolonged contemplation of disks of earth, etc., by which (*d*) a number of supernormal states are induced, the so-called *dhyānas* (*jhāna*), or 'trances' and *samāpattis*, or 'ecstasies.' According to the Pāli and Sanskrit theologians it is only when absorbed in those supernormal states that a man is susceptible of rightly understanding the four Buddhist Truths (*satyābhisamaya*) and thus progressing towards *nirvāṇa*. Now it is quite safe to state that meditations on corpses, restraint of breath, the diverse methods of inducing trance, and the trances themselves have been borrowed by Buddhism from Hindu *yoga*. Buddhism established, more or less artificially, a strong connexion between those archaic devices of *yoga* and its own spiritual aim, *nirvāṇa*. But Buddhists did not ignore, and their books do not conceal, the fact that the discipline of *yoya*, while it may be made 'supramundane' (*lokottara*), *i.e.* utilized for the conquest of *nirvāṇa*, also provides a man with many 'mundane' (*laukika*) advantages: he who lives in cemeteries acquires power over the *bhūtas* and the manifold spirits who haunt these places; he who 'restrains the breath' masters thought and the body; he who practises trance becomes the possessor of magical powers and secures rebirth amongst gods. In short, a man who practises *yoga* becomes a *yogin*, or a *siddha*, an owner of 'perfections' or 'powers' (*siddhi*). It is clear that the position of Buddhism is not a safe one. Let us state it in plain words. A monk must perform in a Buddhist spirit, *i.e.* for the sake of *nirvāṇa*, a number of rites and meditations which confer the most precious 'mundane' advantages; he must disregard these advantages—which, in India, are the surest mark of holiness—while he perfectly knows that he can enjoy them when he likes. We may be sure—even if there were no documents to this effect—that many of the monks of early

[1] Fully analyzed by E. Burnouf, *Introd. à l'hist. du bouddhisme indien*, p. 528.

[4] *The [Mañjuśrī]nāmasaṃgīti* has been published by I. P. Minayeff together with the *Mahāvyutpatti* in *Buddhism, Researches and Materials*, Petrograd, 1887, i. sect. 2 (in Russian); we refer to the commentary called *Amṛtakaṇikā*.

[1] *Satyavachana*; see E. W. Burlingame, in *JRAS*, 1917, p. 429.

[2] See, *e.g.*, R. Spence Hardy, *Eastern Monachism*, London, 1860, pp. 26, 30, 240; H. C. Warren, *Buddhism in Translations*, Cambridge, Mass., 1896, pp. 302, 321. A large portion of the *Rgyud* is *paritrā*.

Christianity were not strong enough to resist so powerful a temptation; *e.g.*, they performed miracles for 'vain glory.' In such cases they acted as 'mundane' *yogis*; technically they followed the rules that later constitute the *Yoga-tantra*.

II. *MAHĀYĀNA.* — In Mahāyāna *bhakti*, or devotion, and *pūjā*, or worship in the Hindu guise, increase.

Mahāyāna is, like Hīnayāna, a thoroughly Buddhist discipline, viz. a way to *nirvāṇa*; the disciple of Mahāyāna is a candidate for Buddhahood (*bodhisattva*, future Buddha), because Buddhas alone reach *nirvāṇa*; he will become a Buddha by acquiring the wisdom and accumulating the merit of a Buddha. But an essential feature of the doctrine is that the candidate for Buddhahood cannot succeed without the help of the Buddhas and of the future Buddhas nearing Buddhahood; this help is secured through *bhakti*. The early Buddhist paid worship to Śākyamuni, to the relics, to the holy places, but there was little or no *bhakti* in his respectful behaviour. Now the objects of worship are so many living gods, so many *bhagavats*, quite different from Śākyamuni, very much like the Hindu *bhagavat*, and they are entitled to the *bhakti* of the faithful. As has been pointed out several times,[1] *bhakti* is seldom free from elements which easily take a Tāntrik shade. To mention only one point: a man will be saved by remembering at death the name of Avalokita or of Kṛṣṇa. The names of the Buddhas or the *bodhisattvas*, the mystic formulas in which they have themselves placed a wonderful force, acquire a rôle in the sanctification of the devotee. *Bhakti* has exalted the god to such a degree that *bhakti* is no longer necessary. Śāntideva, an orthodox divine of the Mahāyānist school, praises without reservation the use of *dharaṇīs* for the pardon of sins.[2] The schools of the Mahāyāna known as the Sukhāvatī sects place the highest spiritual advantages at the command of the man who knows how to worship Amitābha.[3]

Every form of *pūjā*, including the circumambulation of a *stūpa*,[4] offering flowers to a *stūpa*, giving food to the monks, etc., was considered very useful from the beginning. A treatise like the *Ādikarma-pradīpa*[5] shows us that Mahāyāna has added much to the primitive liturgy; it gives a description of the many acts of worship which a Mahāyānist devotee, a 'beginner' (*ādikārmika*), was expected to perform — recitations of formulas, symbolic offerings, wonderful advantages to be obtained by acts which easily assume a mechanical character, so many features which give to Tantrism its specific aspects. A daily observance was the eightfold high *pūjā* (*aṣṭavidhā anuttarā pūjā*), a sort of worship 'in spirit and truth': confession of sins to the Buddhas and *bodhisattvas*—to the Buddhas who have a special claim to the title of 'Buddha of confession'[6]—resolve to become a Buddha, 'application of merit' (*pariṇāmanā*), etc. That this eightfold *pūjā* often becomes a mere ritualistic performance—a special kind of *dhāraṇī* —is proved by the fact that it is a part of the *śādhanas* (see below). It is well known that Mahāyāna is prompt to admit any sort of spells that provide 'mundane' advantages[1] —of course it objects to 'black magic.' From our point of view, it is more important to observe that Mahāyāna worships a number of beings which are no longer Buddhist in character.[2] The demoniac origins of Vajrapāṇi are not forgotten; he nevertheless obtains a high rank in the pantheon; as he is the 'destroyer of the enemies of the Law,' he is probably one of the first gods who have been worshipped under a 'choleric' aspect.[3] Female figures —*e.g.*, the Tārās—are associated with the Buddhas, but there is not in this association any tinge of 'properly so called Tantrism.' The same can be said of Hārītī, the former goddess of smallpox, the account of whose avatars is one of the most curious and the best known pages in the religious and iconographic history of Buddhism. Her worship, both in the monastic and in the popular *milieux*, gives a correct idea of the Mahāyānist and of the half-Tāntrik methods of worship.[4]

III. *TANTRISM PROPER.*—Tantrism, properly so called, bears a twofold character; on the one hand, it is a systematization of the vulgar magical rites and it has existed under this form for many centuries in India and in Buddhism itself, together with its formulas and its pantheon; on the other hand, it is a 'theurgy,' a highly developed mysticism styled Vajrayāna; under this form Tantrism is an innovation in Buddhism.

Tantrism has its professionals, the sorcerers (*yogin*, *siddha*), and its laymen, the *clientèle* of the sorcerers, also all the Hindus who worship deities or idols of the Tāntrik type. The sorcerers, who are at the same time 'mystics' or adepts of the Vajrayāna, constitute a number of schools; there are many rival secret traditions characterized by different sets of formulas, of deities, and of theories.

We shall deal with only two points which deserve special notice: (1) the methods of *sādhana*, (2) the *vajrayoga*. To be complete, it would be necessary to study a number of *vidhis*, or rites, many of which are part of the Tāntrik daily cult and have been adopted by Mahāyānist Buddhism.[5]

1. **Sādhana.**—In order to perform a *sādhana*, *i.e.* the evocation of a god, the ascetic must be duly instructed by a *guru* and duly consecrated. The ascetics who have established the manifold secret sects of Tantrism had to propitiate the gods by long austerities and meditations before being favoured with the manifestation of the god; they at last received from him the secrets they are now able to teach to their pupils. The *guru* therefore assumes great importance: he is the paramount god of his pupil and the incarnation of the Buddha himself. When he has been taught all the details of the rites, the Tāntrika must undertake the *sādhana*, by which he renders visible any god he wishes and obtains control over him. The most important items in these magical performances are the knowledge of the *bīja*, the mystic syllable which is the 'germ' or the 'seed' of the god, and the knowledge of the *vidyā* or *mantra*, which gives to its owner control over him.

On a chosen day the ascetic, after performing the regular ablutions, wearing a neat dress or a new dress, goes to a solitary place, either auspicious—a wood or the bank of a river

[5] A glance at the catalogue of the *Rgyud* will show the variety of the *vidhis*.

—or loathsome—a cemetery—according to the purpose. He sits there at ease in a purified spot and fulfils in order the different acts of a Mahāyānist *pūjā*, offering of flowers and perfumes, either mental or real, to the host of Buddhas and *bodhisattvas*, confession of sins, etc.[1] He continues in the same style by practising the virtues of friendship, pity, joy, indifference, by dwelling on the essential voidness of all things. Thus he is supposed to have acquired both merit (*puṇya*) and wisdom (*jñāna*): all this is only a preparation to the rite itself. The rite begins with the meditation on the *bīja* of the god who has been chosen for some technical reason (every god has his own department in mundane and supramundane affairs). If the god is Yamāntaka or Yamāri (the enemy or the destroyer of Yama, god of death), the syllable is *hūm*; it is to be written on the disk which in the magic circle (*maṇḍala*) is the symbol of the sun. The ascetic causes to arise from *hūm* the wrathful Yamāntaka, hair bristling, blue, with six faces, with six arms, with six feet, riding a bull, standing in the *ālīdha* pose, adorned with a garland of skulls, exceedingly frightful. When the god has been summoned in that way, the ascetic undertakes the second part of the rite: he fancies that he is the god; the identity of the ascetic and the god is a metaphysical truism; the ascetic does not identify himself with the god, he only realizes the identity. As soon as the ascetic knows that he is the god, he possesses all the powers that belong to the god: any wish he utters in the proper form—for his voice must be the voice of the god—will surely be accomplished.[2]

As A. Foucher, from whom this definition of *sādhana* is borrowed, rightly observes, the description of the gods as given in Tāntrik treatises must be accurate: any mistake in the mental representation of those frightful persons would be fateful. The *Sādhana* treatises have been the pattern according to which Hindu and Tibetan artists worked, and they furnish the best means to the identification of the icons or idols.

Sādhanas serve all sorts of purposes—worship, white and black magic. In many cases they are complete with their first part, the summoning of the deity, to whom worship and prayers are respectfully offered. More often, when the deities are the 'girls' or 'princesses' (*kumārī*, which is not 'virgin'), or the 'ascetic goddesses' (*yoginī*), we have to deal with the worst features of paganism.[3]

2. Vajrayāna.—But Tantrism is much more than a pagan system of rites of worship and sorcery. It is a vehicle (*yāna*, *naya*), a way to final liberation or to the *summum bonum*. Tantrism is the Tantrayāna, or the Mantrayāna (=*naya*), 'Vehicle of the Magic Formulas,' more often and more technically, the Vajrayāna. *Vajra*, 'lightning,' is originally and remains the weapon of Indra, of Vajrapāṇi, of the ascetics or *yogins*, against human or demoniac enemies. But *vajra* has assumed new meanings: (1) it designates the mystic or divine energy which is identified with 'intelligence' (*vijñāna*): there are *vajrabodhisattvas*, '*bodhisattvas* of *vajra*,' *vajrayoginīs*, 'divine female sorcerers,' *vajravarāhī*, 'the divine sow'; all divine beings are so many *vajrasattvas*, 'beings of *vajra*'; the supreme being, the Ādibuddha,[4] is the *vajrasattva par excellence*. (2) On the other hand, *vajra* (with the variant *maṇi*) is a decent or mystic phrase for *liṅga*, the male organ, just as *padma*, lotus, is the literary rendering of *bhaga* or *yoni*.[5]

To this twofold meaning of *vajra* correspond two Tāntrik schools, right-hand and left-hand. Both owe much to the Mahāyānist doctrines, to Madhyamaka, and to Vijñānavāda;[6] they cling to the theory of universal voidness (*śūnyatā*), but they develop the concepts of *tathatā*, *tathāgatagarbha*, etc., and result in an undisguised monism. While Mahāyāna states that all beings are 'future Buddhas,' that all beings are 'embryos of *tathāgatas*,' the two Tāntrik schools maintain that all beings are *vajrasattvas*, are the unique Vajrasattva; they also maintain that the nature of *vajra* is immanent in all beings and can be actualized by appropriate meditations and rites.

Now the left-hand school conceives the nature of *vajra* according to the Śaivite pattern; the right-hand school is nearer the Vedāntist or Yoga tradition: on the one hand the traditions of the *Mahākālatantra*, etc., on the other hand the Church of the *Mahāvairochanābhisambodhi*, the Vajraśekhara, etc.—the modern Japanese sect of Shin-gon-shū.

In the Tantras of the Śaivite type we have to deal with a Buddhist adaptation of Śaivism and Śāktism. The three traditional bodies of a Buddha are preserved, but the true nature of *vajrasattva* is his fourth body, 'the body of bliss' (*ānanda*, *sukhamaya*, *mahāsukhakāya*), the body of *vajra*; it is with that body that the eternal *tathāgata* or *bhagavat* eternally embraces his *śakti*, Tārā or Bhagavatī. From this erotic conception of the nature of being or the divine being it follows that, in order to actualize his real divine nature, the ascetic must perform the rites of union with a woman (*yoginī*, *mudrā*) who is the personification of the *bhagavatī*,[1] who is Bhagavatī herself; as it is said, *buddhatvam yoṣidyonisamāśritam*, 'Buddhahood abides in the female organ.'[2] This truth was discovered by Śākyamuni, who, according to the *Chaṇḍamahāroṣaṇa*, conquered Buddhahood by practising the Tāntrik rites in the *harīm*. The most conspicuous topic of this literature is what is called the *strīpūjā*, worship of women:[3] disgusting practices, both obscene and criminal, including incest, are a part of this *pūjā*, which is looked upon as the true 'heroic behaviour' (*duḥkaracharyā*) of a *bodhisattva*, as the fulfilment of the perfect virtues. Buddhist mythology and mysticism are freely mixed with *śāktas*: the semen is the five Buddhas, etc. The leading idea that 'everything is pure to a pure man,' *omnia sancta sanctis*, is often expressed. 'Lust is to be crushed by lust. . . . Do strenuously that which is condemned by fools, united with your chosen deity, intent upon the purification of thought. Women stirred with the poisonous fire of love provide their lovers, ascetics of pure mind, with all the fruit of love. . . . Enjoy all the pleasures of love without fear. Do not fear; you do not sin.'[4]

We may add two remarks. (1) Some 'moral' rules are to be observed even in the ceremonies (*chakra*) which are provided for the thorough enjoyment of the *ma* (*māṃsa*, 'meat,' *madya*, 'alcohol,' *maithuna*, 'sexual union'). A modern Śaivite work, the *Mahānirvāṇatantra*,[5] explains that 'the ascetics should drink so long as their eyes do not roll and mind is not agitated. Beyond it, drinking is like that of a beast.' The rite of *pūrṇābhiṣeka* or *tattvachakra* must not be practised with any woman, but with one's own wife; so far, good, but there are two sorts of marriages, one for life, the other contracted for the purpose of the rite and lasting only till the completion of the rite. (2) Secret rites are the business of a few 'devotees.'

[5] Tr. Manmatha Nath Dutt, *Wealth of India*, Calcutta, 1899–1900, vii.–viii.

On the whole and for the largest number of its adherents, Tantrism is simply paganism.

According to the left-hand Tantrism which we have described, the rites of union (*maithuna*) are not efficacious by themselves: before practising them the candidate for *vajrasattva*-hood must be 'purified' in a threefold respect; he must possess the body, the voice, and the thought of a *tathāgata*. This threefold purification constitutes the Tantrism of the right hand.

These are 'aspersions' or 'consecrations' (*abhiṣeka*),[1] 'marking' (*nyāsa*) which consecrates the different limbs of the body, 'prayers' (*japa*) which purify the voice. The most intricate part of this discipline concerns thought. No Western scholar has yet endeavoured to understand the three mysteries of the body, the voice, and thought, the *vajradhātu* and the *garbhadhātu*, the five *tathāgatas* (the so-called *dhyānibuddhas*[2]) who are associated with five wisdoms, with the five *dhātus* (earth, etc.), etc.; the Buddha, Vajra, and Padma class of formulas, etc. We depend on the descriptions of the Shin-gon-shū sect, which are too meagre and obscure to be thoroughly intelligible.[3] The opinion of the present writer is that a number of schools are to be distinguished: there are branches which are connected with *rājayoga* (meditation and knowledge are the only means to the actualization of the nature of a *tathāgata*); some other branches praise ritualistic performances, especially 'intertwinings of the fingers' (*mudrā*);[4] some will admit the rite of union, but with a female described as a *jñāna-mudrā*, a mental female.[5]

TAOISM.—Taoism is one of the three 'Teachings' (*Sam Chiao*) of China, the others being Confucianism and Buddhism. Like Confucianism, and unlike Buddhism, it claims to be a native growth.

1. Lao-tse.—The primary source for our knowledge of Taoism is the *Tao-Teh King*. This small book of about 5000 characters, usually divided into two parts, 'Concerning Tao' and 'Concerning Teh,' comprising 81 chapters, is traditionally ascribed to Lao-tse (born 604 B.C.), an older contemporary of Confucius. Lao-tse, surname Li, name Erh (= 'ear'), also known as Tan, a character which implies some aural peculiarity, is said to have been an official at the court of Chow and to have been visited on one occasion by Confucius, who after the interview compared him in his lofty incomprehensibility to a soaring dragon. Despairing of the world, Lao-tse retired from office and disappeared through the Western passes, the guardian of which induced him before leaving to compose the *Tao-Teh King* as a record of his teaching. This account of him was in later times supplemented by many marvels—*e.g.*, his prolonged gestation, which entitled him to be called 'old boy,' as his name Lao-tse might also be translated. Si-ma Ch'ien († 85 B.C.), who gives the more sober account of Lao-tse, gives also the names of his son and grandson and of the great-great-grandson of this grandson. He tells us further that about the middle of the 2nd cent. B.C. a book of Lao's was a favourite with the widowed empress of the second Han emperor. The emperor King (156–143 B.C.) is said to have made it a 'classic.' Still further back than Si-ma Ch'ien we have in Hwainan († 122 B.C.), Han Fei († 230 B.C.), and Chwang-tse (4th cent. B.C.) many quotations from Lao-tse (or Lao Tan) which are to be found in the *Tao-Teh King*. According to Legge, the first two of these authors quote the whole or parts of 71 out of the 81 chapters of that book. On a review of the evidence thus summarized, Legge concludes that he does not know of any other book of so ancient a date of which the authenticity of the origin and genuineness of the text are so well substantiated.

Criticism, however, has been busy both with Lao-tse and with his book. Founding upon the name Lao-tse, which may mean equally well 'old philosopher' or 'old philosophers,' an extreme criticism has resolved him into a number of ancient thinkers, some of whose sayings are preserved for us in the *Tao-Teh King*. For this view there is no ground except the ambiguity of the name. A less drastic criticism, of which H. A. Giles is representative, allows that at a remote period Lao-tse lived and thought and taught, and that some fragments of his teaching are preserved in the *Tao-Teh King*, in which we have those fragments pieced together by a not too skilful forger of the 2nd cent. B.C. with padding of his own. This conclusion is said to be practically certain. The criticism, however, by which it is attempted to establish this conclusion is somewhat crude. The external evidence summarized above at least does not support it; nor is it warranted by the occurrence in early Taoist writers of sayings ascribed to Lao-tse which do not appear in the *Tao-Teh King* and of sayings ascribed to Hwang-ti which do appear there, or by the evidence adduced from the *Tao-Teh King* itself (repetitions, quotations, late characters, rhyme), while the discrimination of what is admitted as genuinely from Lao-tse from what is rejected as compiler's padding is too subjective to be convincing. In favour of the earlier date of the *Tao-Teh King* it may be noted that, in its general type of teaching and in the avoidance of technical terms current in later Taoist authors it leaves on the reader the impression that it belongs to a less developed stage of Taoist thought than is found in them. The *Tao-Teh King*, however, still awaits a thorough application of sound critical principles. Indian influence on both the matter and the form of the *Tao-Teh King* has been asserted by some. The truth of this assertion cannot be considered apart from the general archæological question of the intercourse between India and China. There is a certain congruence between the mood of the *Tao-Teh King* and Buddhism, but not such as requires the dependence of one on the other as its explanation, and the present state of our knowledge hardly warrants the assumption of contact with Indian thought early enough to influence the *Tao-Teh King*, unless that book is dated later than all the other evidence seems to demand. According to D. T. Suzuki, the so-called Indian influence on the early Taoists is not probable. It is curious that in *Tao-Teh King*, ch. 39, § 3, there is an illustration taken from a chariot and its parts to which T. W. Rhys Davids[1] quotes a close parallel as having been used by Nāgasena, the founder of the Madhyamika school of Northern Buddhism, who taught about the beginning of our era. It is to be noted, however, that the same argument, only with a horse instead of a chariot as illustration, is found in Chwang-tse, bk. 25, p. 126.

It is not difficult to cull from the *Tao-Teh King* admirable ethical maxims.

[1] See INITIATION (Buddhist), vol. vii. p. 321, under 4 and 5.

[2] This phrase has never been met in any Sanskrit book.

[3] R. Fujishima, *Le Bouddhisme japonais*, Paris, 1889, pp. 81–99.

[4] See Si-do-in-dzou, 'Gestes de l'Officiant,' *AMG*, *Bibl. d'Études*, t. viii., Paris, 1899.

[5] *Mudrā* has a twofold meaning.

[1] *Buddhism*, London, 1878, p. 97.

'The highest goodness is like water. Water is good for advantaging all things and does not strive. It takes the place that all men hate' (ch. 8). 'He who raises himself on tip-toe cannot stand: he who straddles cannot walk' (14). 'He who overcomes men has force; he who overcomes himself is strong. He who knows he has enough is rich' (33). 'I have three precious things which I count and hold precious. The first is gentleness. The second is moderation. The third is not daring to take the first place under heaven' (67). To these might be added, but for the considerations mentioned below, the famous 'Recompense injury with kindness' (63).

The virtues commended lie in the line of self-suppression. For the inward state of which they are modifications the characteristic word is *hsü*, 'emptiness,' *i.e.* freedom from desires. Corresponding to this inner freedom from desires is the outward life of non-action (*wei wu wei*), *i.e.* absence of self-determined action for particular ends. Hence the world is an ethical danger (12), for it is by the world that we are drawn out into desire and action away from the stillness of our inner being, which it should be our object to keep (5), though this true type of life is unattractive except to the sage (35). He attains this life by a process of abscission of motives, by which he arrives at a childlike state of spontaneity and tenderness, in which there is also exemplified the paradoxical possession of security and strength (10, 20, 28, 55). This ethical ideal is supported by various arguments. Thus in ch. 13 the argument seems to be that to be in a position to enjoy what the world regards as honour is to be exposed to what the world regards as calamity. That which makes me a possible subject of either is just that I am an object to myself. The sage therefore treats his person as if it were alien from him. He never identifies his happiness with this or that, so never loses his happiness. Having no private ends, his private ends are realized (7). Again, it seems to be argued that as ideas suggest their contraries—*e.g.*, to know beauty is also to know ugliness—so the sage, seeing that everything is dogged by its opposite as by its shadow, refrains from all positive action (2). From the external world Lao-tse gathers illustrations, both negative and positive, of his teaching. The short-lived storm of wind and rain suggests the futility of violent action. Water in its fluidity and taking the lowest place exemplifies absence of self-determination and humility, while, as it also benefits all things and wears away that which is hard, it illustrates the paradoxical issue of *wu wei* ('Do nothing') in *wu pu wei* ('There is nothing that is not accomplished'). Specially is illustration to be found in vegetable life, which in obedience to an inner impulse or appointment passes through its cycle of growth, culminating and again subsiding (16). The Taoistic life is therefore a life of equable indifference, outwardly of non-action, devoid, *i.e.*, of action for chosen ends; moved in obedience to an inward spontaneity rather than motived by outward inducement; a life conscious, rather than self-conscious, spontaneous rather than self-determined. Hence the sage is 'simple' (19) with the simplicity of unwrought wood as contrasted with the definiteness of a carved beam; *i.e.*, he is free from self-determinateness. Again, he grasps 'the one' (22), withdrawing himself from the manifoldness of self-determination along particular lines and holding to 'the one,' *i.e.* the principle which Lao-tse knows as *Tao*.

The metaphysics of the *Tao-Teh King* centre in this conception of *Tao*. In many passages *Tao* has its common meaning of 'a way,' either the ethical way that men should follow or the method of action followed by Heaven (cf. 'course of Providence') or prescribed by Heaven for man's following. But elsewhere it is a metaphysical principle (chs. 1, 4, 14, 21, 25, 34, 37, 40, 42, 51, 62). The gist of what is stated in these chapters is as follows: The origin of heaven and earth is nameless (1), is indeed non-existence (40), something quite indefinite, which, when we attempt to define it, becomes nothing (14, 25); if we must make a name for it, we may call it *Tao*: it may seem to be prior to God (4); it becomes nameable in relation to the universe that springs from it (1), in an order which may be partly known (42); not only is it the origin of the universe as a whole, but it presides over all beginnings (21), reaching everywhere (25, § 3) and doing everything, while it seems to do nothing (37).

Summing up what we have here, we may say: (1) as transcendent existence *Tao* is something quite indefinite, which Lao-tse struggles to express by negatives; (2) from this indefinite ground the universe of things issues by a process which is emanation from *Tao* as mother and not creation by *Tao* as agent; (3) *Tao* is immanent in the world, working in an unobtrusive way, producing and bringing to perfection individual existences. On the whole, we perhaps come nearest to the meaning of *Tao* when we say that it is pure being (most abstract of categories) endowed with spontaneity, the ultimate essence and impulse of all definite things. Obviously this conception of *Tao* excludes all idea of its equation with God. In ch. 4 Lao-tse says of *Tao*, 'I do not know whose son it is: it appears to be before God (*Ti*).' There can be no doubt that with Lao-tse *Tao* is the ultimate ground of all definite existences, *Ti* among them, while, by saying that he did not know whose son *Tao* was, he lets us see that, having arrived at his conception of *Tao*, beyond which he could not go, for in the line of logical abstraction there is no going further than 'being' which is nothing, he yet dimly felt that it did not explain itself.

The only other term in the *Tao-Teh King* capable of a theistic interpretation is *T'ien*, Heaven. In some instances of its use a near approach is made to what we mean by Heaven when we use it as equivalent to Providence. In this, its highest, use it is not merely the physical sky, but a power supreme in the world of visible things obscurely connected with the sky, which is the supreme exemplar of *Tao*, but, even so, posterior and subordinate to it. *Tao* is to Lao-tse the ultimate and determining fact.

His metaphysic, as thus explained, explains his ethic. The ground of existence being a perfectly indefinite spontaneity, a dark abysmal one from which, for no reason assigned, the multiplicity of the world emanates, by the immanence of which the world is and is moved—all this agrees with the ethical doctrine of abstention from self-determination and of sinking back on the inner ground of our being that we may be as this spontaneity in us causes us to become. Here is the justification for regarding Lao-tse's doctrine as simply a variant of 'Follow nature'; only we must remember that *Tao* is both the substantial essence and the dynamic spontaneity of all things. This, of course, brings up the difficulty of accounting for the existence in *natura naturata*, the world of concrete things, of any contrariety to *natura naturans*, *Tao*, and raises the question, neither asked nor answered by Lao-tse, why a short-lived storm is not as much an expression of *Tao* as the enduring stillness of Heaven.

Before turning again to the practical side of Lao-tse's teaching, we may refer to what may, by courtesy, be called his theory of knowledge. It is by freedom from desire that we can attain to a knowledge of the mysteries of *Tao* (1). Inasmuch as *Tao* is the principle of all existence, knowing it, we are at the heart of all knowledge. There is no need for the sage to expatiate over the world. Without moving out of doors he already knows (47). Knowing one case, he knows all, for *Tao* is the one universal principle (44).

We can best return to Lao-tse's practical teaching by the word *Teh*, which next to *Tao* is his key-word. Like *Tao*, it received from Lao-tse a

new meaning, since it is the outcome of *Tao* (51). There is indeed a *Teh* which begins where *Tao* ends (38). This is the *Teh* which is the result of effort, self-conscious *teh*. *Teh* in the Taoist sense is usually distinguished by some epithet—'mysterious,' 'large,' 'lasting,' etc. As the outcome of *Tao*, it is activity devoid of self-determination, the expression of the spontaneity of the immanent *Tao*. The various virtues commended by Lao-tse are aspects of, or approximations to, this *teh*. It is in this Taoistic sense that we must take the famous maxim 'Recompense injury with *teh*,' where it is a mistake to translate *teh* by 'kindness.' The maxim is no more than a precept of indifferent self-possession: 'Be a Taoist, even though provoked' (cf. 5).

Lao-tse's practical teaching is completed by his speculations on physiology and politics. As to the former, it is asserted that the Taoist adept attains to 'lastingness' (7, 16, 44, 59). There is no place of death in him, and so he passes through dangers unscathed (50). Hints are also given of a death which is not destruction, implying a persistence in spite of death which is true long life (33). This thought, however, is not developed. With the other form of longevity appears to be associated a certain management of the breath (10, 52), and through this vein of thought there is a connexion with later Taoist developments.

In Lao-tse's politics, as in his ethics, there are attractive thoughts—*e.g.*, the protest against luxury in the court alongside misery among the people (53) and the detestation of war (31). The Taoist method of government is *laissez-faire*. The sagely king does nothing, and everything comes right of itself (32, 37, 57). Logically Lao-tse's thought implies that any sage would be the centre of a universal sway (49, 57, 77), but it is hinted that the influence of a sage becomes effective only when he has the advantage of high place (56). Here Lao-tse is in line with Confucius, who asserted that his principles would transform the world if only he could find a ruler wise enough to give him office. In describing the society which would come to being under Taoist influence, Lao-tse pictures small stay-at-home communities devoid of letters and of luxury, content with what is theirs and utterly incurious of what is not. As men within a Taoist society so societies in their relation to one another are to act Taoistically. The right way is one for men and for States (61).

There are unexplained remainders in the *Tao-Teh King*, but Lao-tse does give us a reasoned view of things. As we think back and back, we come to something which we cannot see or hear or touch, an obscure something from which all things come. It is in all things, which could not be apart from it. Yet it never parades itself. It simply is, a mysterious, ever-during, all-working existence. Let us conform ourselves to this: let us become one with it. For it is in us as in all else—our essence which would realize itself if it were not hindered by our self-will and self-seeking. If we put away these, then we know it and are and become what it tends to be. It is *Tao*, unqualified being, origin of things, and in them as essence and spontaneity.

2. Taoism before Lao-tse.—The question has been raised whether Taoism existed prior to Lao-tse. That there was such an early Taoism is argued on the grounds of quotations in the *Tao-Teh King* from earlier Taoists, the persistent reference of Taoism not only to Lao-tse but also to the at least semi-mythical Yellow Emperor (Hwang-ti, 2697 B.C.), so that 'the words of Hwang and Lao' came to be a term for Taoist teaching, and the allusions in the *Tao-Teh King* and other Taoist writings to an age when the world moved on Taoist principles. It has also been argued that, while the *I-King* is dualistic, it also contains allusions to a monistic and idealistic strain in pre-Confucian speculation, and that a doctrine of that from which the dual principles derived (*Tao*) was in various forms well known. Hence, it is claimed, the *I-King*, the doctrine of *Tao*, and some strongly held ethical principles intuitively known were the materials on which Confucius and Lao worked, Lao appropriating the monistic sayings of the *I-King* but placing his chief reliance on the doctrine of *Tao* as handed down from the Yellow Emperor.[1] In the same line E. H. Parker[2] says that there is little doubt that Lao-tse simply gave a name (*Tao*) to a floating group of ethical principles already for many centuries spread far and wide over China and already well known as the maxims of Hwang-ti, and that every single thought in the *Tao-Teh King* had been foreshadowed, usually word for word, in the *Book of History*, *Book of Rites*, *Record of Rites*, *Book of Changes*, *Book of Odes*, or other very ancient work. Among these other ancient works Parker puts the volume attributed to Kwan-tse, which he dates from the 7th cent. B.C. In spite of all that is here said, it may still be reasonably maintained that there is no conclusive evidence of an explicit Taoism previous to Lao-tse. Even Parker does not deny a certain originality to Lao-tse in developing a new quietistic conception of how human affairs once presumably were, and ideally should be, regulated. There may have been a floating group of ethical principles which Lao-tse took over, but it is the reasoned quietism of the *Tao-Teh King* based on *Tao* as metaphysical principle that alone has the right to be called Taoism, and of the earlier existence of this proof is yet lacking. In the *Tao-Teh King* itself there is no mention of Hwang-ti, and the allusions to the simpler social conditions of earlier times do not prove the existence then of a reasoned Taoism. Certainly this would be proved if we found Lao quoting 'from some sage anterior to himself who had already formulated the doctrine of inaction in the very terms we are accustomed to associate with the name and fame of Lao-tse himself.'[3] The reference is to *Tao-Teh*, ch. 57. But the introductory phrase may be translated 'Therefore the sage says,' meaning that such language is characteristic of the sage, whether actually or hypothetically existing, just as the next chapter contains a similar gnomic reference to the sage's action. Five other quotations (22, 41, 50, 69, 78) may be admitted, but they are not of a kind to prove the existence of Taoism anterior to Lao. Only if numerous other phrases introduced by the formula '*ku yüeh*' are treated as quotations, can justification be found for speaking as Legge does of 'the sentence-makers often drawn on by Lao-tsze'[4] or for saying that Lao-tse 'abounds in sentences out of some ancient lore of which we have no knowledge but for him.'[5] But these phrases may not be quotations so much as aphoristic expressions of Taoistic teaching, perhaps already current with Lao and his school. Parker's wide reference to ancient literature must be heavily discounted. It is difficult to justify his appeal to books so innocent of Taoism as the *Book of History* and *Book of Odes*. Moreover, it is one thing to find in ancient literature expressions congruent with Taoism and quite another thing to find expressions essentially Taoistic. It is true that *Tao-Teh* is a conjunction of characters

long consecrated by use in the *Book of Changes* and the *Book of Rites*.[1] In the *Book of History* or elsewhere we may meet with phrases such as 'The Son of Heaven acts as the people's Father and Mother, and as such is the King of the world,' or 'That the Prince of a State should hold dirt in his mouth is the Providence (*Tao*) of Heaven.' But such things do not prove the existence of Taoism as a scheme of thought prior to Lao-tse. Nor, when we read in the *Tao-Teh King*, 'Thus we cannot say that the ancients meant nothing by the expression "Bend and survive,"' is it quite legitimate to annotate, 'Note Lao's allusion to more ancient philosophy.' There is no evidence that the ancients grounded this maxim on a metaphysical *Tao*. The *I-King* does in parts[2] contain indications of what may be called Taoist philosophy; but this very fact leads Legge to put the origin of these parts posterior to Lao-tse in the 5th or 4th cent. B.C. Kwan-tse may be dated in the 7th cent. B.C., but the work ascribed to him is suspected of being a forgery of a later date. In the present state of our knowledge it is probably right to say that the existence of a Taoist philosophy prior to Lao-tse is not proven. The *Tao-Teh King* may still be taken as the earliest example of Taoist thought.

3. Taoism after Lao-tse.—The history of Taoism immediately subsequent to Lao-tse is obscure. Somewhat later its development can be traced in a succession of authors.

(*a*) *Lieh-tse.*—The earliest of these may be Lieh-tse (=Licius, 5th cent. B.C.), but the authenticity of the work ascribed to him is doubtful. According to him, the whole of things is in perpetual transformation. The ultimate basis of all is a vague something which differentiates itself into *ch'i*, *hsing*, and *chih*. The second and third terms may be translated 'form' and 'matter' respectively, though we must beware of assuming an exact equivalence to these terms as used elsewhere (*e.g.*, in Greek philosophy). *Ch'i* is more difficult to translate. Giles[3] gives as its meanings 'the vivifying principle or aura of Chinese cosmogony: breath, vital fluid: force: influence.' The state of things when these three were in an undifferentiated and therefore imperceptible condition is called 'chaos,' whether this is or is not to be identified with the ultimate origin and basis of things. Progress is made from chaos by an evolution vaguely indicated, in the final stages of which the pure and light portions form 'heaven,' the heavy and gross form 'earth,' and 'man' appears as the vehicle of their harmonious *ch'i*. The general ethical temper is quietist, based now on ignorance, now on fatalism. Another root for it is found in the subjectivity of knowledge, and the absence of any criterion of truth and falsehood, right and wrong, though this is hinted at rather than developed. Along with this may be noted a disclaiming of any discrimination in worth between waking and dreaming experiences. Views of death are given which are perhaps not quite consistent. On the one hand is put the question, which might suggest Buddhist influence, 'When the spiritual enters its gate and the material returns to its root, where do "I" survive?' On the other hand, it is asked whether death may not be another birth. Lieh-tse makes much use of anecdotes, a good many of which seem to have been treated by Taoist writers as the stock property of their school. The magical side of Taoism shows in Lieh-tse considerable development as compared with the *Tao-Teh King*. The secret of it is such a selfless identification with the life of nature as brings the Taoist into harmony with all its forces, animate and inanimate. The alleged immunity of a drunken man from injury by accident is used to illustrate the still higher immunity which one would enjoy who was entirely under the influence of the 'heavenly' (*i.e.* 'natural' as opposed to 'self-determined') element of his constitution.

(*b*) *Chwang-tse.*—The most brilliant of the Taoist writers is Chwang-tse (*c.* 330 B.C.). In him as little as in the *Tao-Teh King* is there any systematic exposition of Taoism. In the development of his views he uses various literary devices—anecdote, allegory, and imaginary conversation. In some places he handles somewhat freely not only Confucius, but even more ancient worthies, such as Yao and Shun. How little historical accuracy or consistency is regarded is shown by the fact that Confucius is also introduced speaking in quite a Taoist vein. It is not easy to see the drift and relevance of all Chwang-tse's chapters, but the reader cannot fail to find a characteristic attitude towards reality. As in the *Tao-Teh King*, the metaphysical basis of everything is *Tao*, which as the explanation of all things is not itself a thing. It is more abstract even than non-existence, which is made definite by its opposition to existence, and so it may be called non-existing non-existence. To call it *Tao* is only a metaphor. From this absolute indifference all existences, including spirits and God, have come. No explanation is given of this coming into existence of definite things, though, to be consistent with the general scheme, the evolution must be unmotived and spontaneous. The process from unconscious indifference to the world of consciousness and of differentiated things is described in the allegory of 'Heedless' and 'Hasty' pitying insensible Chaos, and digging in him orifices of perception with the result that he died (bk. 7). *Tao* is in things, their reality and the regulator of their processes. In accordance with this view *Tao* and things are the hints of the illusory nature of all knowledge coming through the senses. The truth of things is perceived by the spirit, and Taoist adepts, when most in touch with reality, are in a trance, their bodies like rotten tree-stumps and their minds like slaked lime. One may notice also the incipient scepticism based on the relativity of knowledge and the phenomenon of dreaming. A paragraph more quoted perhaps than any other from Chwang-tse, though by no means the most central to his position, is that in which he hesitates to decide whether he is Chwang-tse dreaming that he is a butterfly or a butterfly dreaming that he is Chwang-tse. Since *Tao* alone really is, the truth of life is to be found in the above-mentioned trance when self-consciousness and self-determination are completely lost. But, as in the *Tao-Teh King*, so here, things are taken for granted, with *Tao* as their spontaneously operating essence; and in accordance with this assumption the ethical ideal is with Chwang as with Lao a life of spontaneity. There is inculcated an abscission of all definite volition and an indifferent yielding of oneself to the course of nature. Hence follows a characteristic attitude towards death, which is regarded as natural and therefore as little to be feared as birth. The Taoist is independent of all accidents, which are of no importance in comparison with the independent worth of self as an expression of *Tao*. It is only false opinion which differentiates between this and that outward state. If all self-determined effort is a departure from the truth of life, it follows that the devotee of virtue and the worker of iniquity fall under the same condemnation. Hence results a paradoxical levelling down of moral distinction. A similar strain of thought appears in Yang-tse, the heresiarch whom

[3] *A Chinese-English Dict.*, London, 1912, *s.v.*

Mencius criticized, and is there regarded as congruent with the teaching of Lao Tan.[1]

(c) *Han Fei-tse and Hwainan-tse.*—Other writers reckoned as belonging to the Taoist school are Han Fei-tse († 230 B.C.) and Hwainan-tse († 122 B.C.). The writings of the former are preserved in 55 chapters, two of which (21 and 22) are entitled 'Explanations of Lao' and 'Illustrations of Lao.' Apparent quotations from the *Tao-Teh King* occur elsewhere in his writings. Han Fei-tse hardly discusses the metaphysical side of Taoism. His book is ethico-political, and is marked by shrewdness rather than by loftiness of tone. One sympathizes with the Chinese student who protests against his being classed as a Taoist and explains what he regards as the degenerate nature of his teaching as due to a perversion to a scheming selfishness of such sayings of Lao-tse as 'When one is about to take an inspiration, he is sure to make a previous expiration' (36) and 'The sage wishing to be above men, puts himself by his words below them' (66). Hwainan-tse is a more genuine Taoist than Han Fei, but his writings in their fanciful analogies and extravagant statements give evidence of a progressive deterioration of Taoism. Ethically he is superior to Han Fei. In at least one statement of his fundamental ethical position he shows a close verbal approximation to orthodox Confucianism: action in accordance with the nature (*hsing*) is called *Tao*, and this nature is to be distinguished from the passions (*yü*).

4. **Later Taoist literature.**—Later Taoist literature is voluminous and reflects that medley of subjects which make up Taoism, such as the search for immortality (which Chu Hi singles out as its main object), the conquest of the passions, alchemy, amulets, the observance of fasts and sacrifices, ritual and charms, and the multiplied objects of worship. Much of present-day popular hortatory literature may be reckoned as Taoist. Probably the most popular of all Taoist writings is *The Tractate of Actions and their Retributions*, which dates from the Sung dynasty. According to the original text, retribution takes effect in this world. The practiser of virtue indeed not only may receive earthly happiness but also may hope as the culmination of his reward to become immaterial and immortal, *hsien-jen* (=*ṛṣi* of Buddhism). As for the transgressor, he suffers in his person and fortune, and, if at his death guilt still remains unequated by punishment, judgment extends to his posterity. Of this retribution Heaven and spiritual beings are recognized as the agents. In the illustrative anecdotes added in many editions to the original text the stage of retribution includes the other world and successive rebirths in this world. The inculcated morality has many excellent details, but extends also to tabus—*e.g.*, striding over a well or leaping over food.

5. **Present-day Taoism.**—Chang Tao-ling (A.D. 34) has been regarded as the founder of present-day popular Taoism, which is not unfairly described as a mass of superstitious magic. The earlier literature, however, makes it evident that before his time Taoism had yielded to the love of the marvellous. Chang Tao-ling is said to have received from Lao-tse himself, who appeared to him from the realm of spirits, a sword and other apparatus in virtue of which he was able to exercise control over the spirit world. Descendants of Tao-ling, in each of whom it is said the soul of their ancestor is successively incarnate, and whose residence is at Lung-hu Shan in Kwangsi, have inherited his powers, and since A.D. 748 hold by imperial decree the hereditary dignity of 'Master of Heaven.' They are often spoken of in works on China as Taoist popes. After the introduction of Buddhism into China Taoism shows very evident traces of Buddhist influence, which was particularly potent in the 3rd and 6th centuries A.D. In its religious literature and practices it follows Buddhist models and borrows Buddhist phraseology. It has its temples, priesthood, and monasteries. Giles' statement, that the celibacy of Taoist priests has been strictly enforced since the 10th cent.,[1] is subject to qualification. Eitel says that Taoist monks or priests do not take the vow of celibacy. They may keep their families outside the cloister walls and spend the whole time between meals at home.[2] Doolittle distinguishes two classes of Taoist priests.[3] A Christian influence in the names and titles of objects of Taoist worship has also been traced by some (*e.g.*, Wieger). Many of the best known objects of popular worship are members of the Taoist pantheon; *e.g.*, Yü Hwang Shang-ti, who is the Supreme Taoist god, is also he to whom the great name Shang-ti 'sans phrase' would be most readily referred by the ordinary Chinese. Lao-tse is himself worshipped as one of the 'Three Pure Ones' whose images are prominent in every Taoist temple, the two others being Yü Hwang and Pan Ku. Taoism has produced a plentiful crop of legends and fairy-tales, the influence of which is seen in Chinese art.

The gulf between the Taoism of the *Tao-Teh King* and present-day Taoism is a wide one. It has to be remembered, however, that even in the *Tao-Teh King* there are passages which suggest a marvellous mastery of nature by the Taoist adept and provide a starting-point for that search after immortality which, according to Suzuki, first opened the door for the inrush of superstition. The suggestion has also been made that, as the opposition sharpened between Confucianism and other strains of thought, all of popular religion and superstition that found no encouragement in Confucianism took refuge in Taoism. Over and above any such accretions and any particular phrases in the *Tao-Teh King* which might provide a germ of magical developments, the general position of Taoism from the beginning exposed it to such deterioration. Starting from the assumption that man and nature are fundamentally one, its quietism obliterated the line between moral and physical, and promised its adept such a harmony with Nature as laid open to him her secrets and made him merely the vehicle of her great powers. The distinctness of the moral person was lost in the all-embracing sweep of *Tao*. Confucianism also speculated on the relation between man and nature, and thought of the sage as exercising a cosmic influence. But this influence is the issue of moral development, and the Confucian emphasis on self-determined morality prevented any sinking of man into nature.

The nobler elements of Taoism are, however, not extinct. The Taoist pope is not recognized as head by all the Taoist priesthood. There are celibate Taoists among whom the nobler Taoist strain is cherished, who disclaim any connexion with him. In some of the secret societies also elements of the higher Taoism survive. Even in Confucian circles classical Taoism has influence. The writer recalls one scholar who would not have described himself as other than Confucianist, who was well acquainted with the *Tao-Teh King*, and who used to repeat with genuine appreciation, 'The highest goodness is like water.'

6. **State relations.**—During its long history Taoism has experienced a considerable vicissitude of political favour and disfavour. In the pre-Ch'in

times the various schools of Chinese thought seem to have been allowed free play. With the Ch'in dynasty, the first emperor of which tried to suppress Confucianism, Taoism was in favour, and it continued to enjoy imperial patronage under the early Han dynasty. Thereafter its political relations were chequered; *e.g.*, in the 6th cent. it was suppressed in favour of Buddhism, while in the 8th cent. it was honoured by the emperor Hsüan Tsung. After other such vicissitudes it was by the late Manchu dynasty reckoned along with Buddhism and Christianity as a heterodox teaching in contrast to the sacred teaching of Confucius.[1] See also art. TARGUMS.—Though the term 'Targum' was used by Jewish authorities to designate the translation of the Hebrew Scriptures into any language, it was specifically restricted to the Aramaic renderings (cf. Ezr 4). Aramaic versions were used liturgically; the Hebrew text was read from a scroll, and this was followed by the Aramaic, recited without book by the official called *meturgeman*. This custom continued to the 10th cent., and was in parts maintained beyond that date. It is possible that the famous rescript of Justinian[2] was directed against the liturgical use of the Targum.

The most widely read of the Targums was that ascribed to Onqelos (*i.e.* Aquila), who lived in the 2nd century A.D. Aquila really rendered the Scriptures into Greek, but his name became associated also with the Aramaic version. Onqelos is a translation of the Pentateuch only, and it is known as the 'Babylonian Targum,' not so much because of its language, as because of its official adoption in the Babylonian Jewish academies. Thus, though edited in Babylonia, Onqelos is dialectically Palestinian. Onqelos probably includes elements of considerable antiquity, which were derived from oral tradition; some of it, on the other hand, is obviously of literary origin. Onqelos went through various re-editings, so that the extant text is not usually referred to an earlier period than the 4th or 5th century. The 'Palestinian Targum' (known also as the 'Targum of Jonathan'), though later than the earliest recension of Onqelos, contains elements older than the latter. The most remarkable theological characteristic of the Targums is the avoidance of anthropomorphisms. They are thus paraphrases rather than translations, though in very large part Onqelos is literal enough.

Similarly there were two Targums to the Prophets: the 'Babylonian' (ascribed to Jonathan, son of Uzziel), which originated (despite its Babylonian use) in Palestine; and the 'Palestinian,' which is fuller of homiletic elements. As selections were read from the Prophets (*haftārôth*) in the synagogues, these Targums also partook of an official character.

On the other hand, there were no such official Targums to those parts of the Bible from which no *haftārôth* were derived. Hence these Targumim to the Hagiographa form independent groups. On the whole they are freer, and in some cases (as in the Second Targum to Esther) are of greater interest for folk-lore than for exegesis. The Targum to the Song of Songs is throughout allegorical.

TATHĀGATA.—Whatever it may have meant originally, or from whatever source it may have been derived, Tathāgata is an epithet of Buddha used to express his very personality. It is, first of all, an appellation to specify his dignity as an enlightened being and a teacher of men and gods. He is the one who has realized the four truths according to reality (*yathābhūtam*) and, consequently, mastered the way to the realization of the truths. Sensation, perception, and thoughts are all under his own control. He is free from the bondage of the six senses and attachment to their objects, because they are not his masters, as they are with the common people, but he is master over them.[1] Thus he is beyond all the commotions and disturbances arising from contact with the objects of sense and thought. He was born a man, but has become a superhuman being in respect of and by virtue of these highest moral and intellectual attainments.[2] In order to express these superhuman excellences of Buddha's personality, the Buddhists from the earliest time used to call their master the Tathāgata with a special reverence. In this use, therefore, the appellation signifies nearly the same thing as Sugata ('the one who has gone blessed'). Here Tathāgata means the one who has gone (*gata*) from the realm of attachment to the other beyond according to reality (*tathā*, which means the same as *yathābhūtam*).

But the virtue of a Buddha does not consist in attaining this position for himself alone. He teaches the people the Way to the same attainment and guides them in its realization. He is the Master who, having himself reached the castle of fearlessness, invites and leads them to the same. The Tathāgata is not only sure that he is the perfectly enlightened one and has thoroughly overcome the miseries of existence, but also equally sure that he is the master of the Truth and the Law. With this confidence he turns the supreme wheel of the Law and roars a lion's roar in the assemblies of beings.[3] Thus the Tathāgata is the enlightened one who knows the Way and reveals that Way by treading which he himself has become the 'thus-gone.'[4] He practises as he preaches (*yathā-vādī tathā-kārī*) and *vice versa*.[5] Though this explanation of the term is, as etymology, certainly far-fetched, it is quite natural that the Buddhists saw in their Master a being without any falsehood and self-deceit. The association of the appellation with the very personality of an unerring Master of the way to final emancipation is undeniable. A stanza which is said to have been uttered by the disciples at the death of the Master is another testimony to this association. It reads:

[1] See *Majjhima*, nos. 102 and 123 (tr. K. E. Neumann, B^3 33, 261 f.), and *Saṃyutta*, xxii. 94, xxxv. 136 (*PTS* ed. iii. 139 f., iv. 127).

[2] See *Saṃyutta*, xxxv. 90, xliv. 2 (*PTS* ed. iv. 64, 380).

[3] See *Saṃyutta*, xii. 21 (*PTS* ed. ii. 27), and *Aṅguttara*, iv. 9 (*PTS* ed. ii. 9).

[4] See *Saṃyutta*, viii. 7 (*PTS* ed. i. 191), xxii. 58 (*PTS* ed. iii. 65); cf. *Aṅguttara*, vi. 64 (*PTS* ed. iii. 417); *Majjhima*, no. 85 (*PTS* ed. i. 372); *Saddharma-puṇḍarika* (*SBE* xxi. [1884] 120 f.).

[5] See *Itivuttaka*, 112 (*PTS* ed. p. 122); *Aṅguttara*, iv. 23 (*PTS* ed. ii. 23 f.). Cf. below, *Lotus*, ch. ii.; and *Mahāvastu* (ed. Sénart, Paris, 1890, ii. 260, 266, 362, etc.).

'The Master, such a Master as he is (*yathā etādiso*), without any parallel in the world, the *Tathāgata* . . . is gone.'[1]

'Thus-gone' is the Master who has seen the way and revealed it to us, according to reality.

To the Buddhists their Master was the 'thus-gone' or 'thus-destined' (translation of Edmunds) to final emancipation, the 'perfected' (*der Vollendete*, Neumann) in wisdom and its realization, in short, the 'truth-winner' (Rhys Davids). The appellation was certainly a self-designation of Buddha, but it was more used by his disciples to express their confidence in the Master.

So far the empirical aspect of the concept. We must now take up the metaphysical side of the idea conveyed by or attached to the term. The Buddhists were, probably in Buddha's lifetime, nearly realizing for themselves the truth that the revealer of the Way must be at home in it, and that therefore he is the Way itself. They said:

'The laws (*dhammā*) are real and not otherwise as they are, and these are perfectly known by the Tathāgata.'[2] Here 'the laws' mean not only Buddha's teaching, but the things taught in his teaching and their essence. Hence the saying: 'He, the Blessed One, knows having known (the laws), sees having seen, born of Light, born of Wisdom, born of Truth (*dhamma-bhūto*), and born of Brhmā; He is the one who reveals and tells, the One who gives immortality, the Lord of Truth, the Tathāgata.'[3] Here we have translated the *dhamma* by 'truth,' *i.e.* the truth expressed in Buddha's laws.

The ideas here formulated cannot be called metaphysical speculations; still they show a tendency to base the faith in the Master on the transcendental entity of the Truth, not only revealed to us by him, but also represented personally by him. The foundation and elaboration of these ideas must proceed to a further development of Buddhological (so to speak, in analogy with 'Christological') speculations. The fact of the faith has been laid down by the personal influence of the Master; thought and clear conception must follow it. And it is quite natural that the Buddhological ideas were always closely associated with the appellation Tathāgata. These thoughts may be studied from three aspects or phases of their development. They are: (1) the relation of the Tathāgata to the Truth (*dhamma*) which he revealed, (2) the communion of the Tathāgata with the many other Tathāgatas, and (3) the eternity of the personality of the Tathāgata.

(1) The term *dhamma* (in both singular and plural) is a very flexible one. But the various aspects of the concept have a necessary connexion, when viewed as centring in the person of the Master. The *dhammā* (plural) are qualities of things, both physical and mental, which are transient, but subject to the laws. These laws make up existence,[4] and our attachment to and thirst for them are the causes of the miseries of life. Misery, its genesis, its extinction, and the way of release from it—these truths have been revealed by the Tathāgata according to reality (*yathābhūtam*). Thus our emancipation from the miseries is possible only by realizing to ourselves the laws according to reality. These are the laws or teachings (*dhammā*) of the Tathāgata. Therefore the laws have their root, light, and basis in the Blessed One.[5] Buddha is the king of the laws. On the other hand, however, Buddhahood is attainable only by the comprehension of the laws. Hence it is true also that Buddha is the protector of the laws, who, leaning upon the laws, reveres, honours, and adores them.[6] The Law and its revealer are mutual in their relations. He who sees the Law sees the Master, and *vice versa*.[1] The *dhamma* is not merely a phenomenon or an instruction; it is in reality the Truth, according to and by virtue of which the Master and his followers, and consequently the Buddhas of the past and future, have attained or shall attain Buddhahood.

(2) According to a commentator, as given by Burnouf, Tathāgata (*tathā-āgata*, 'thus-come[1]') means the one who has come thus, in the same manner as his predecessors, the Buddhas of the past; it is, on the other side, *tathā* and *gata*, 'thus-gone,' and means the one who has proceeded or departed as they.[2] The oneness of enlightenment and Law among the Buddhas of the past and of the present is an idea as old as the history of Buddhism, and the development of its philosophy has always had a close relation with the idea. 'The Tathāgatā (plur.) lead men by the right law (*saddhamma*)'[3]—these are the words believed to have been spoken by Buddha himself to his temptresses. This and similar passages, speaking of the Tathāgatas and the Law, indicate the communion of the Tathāgatas, or the unity of Buddhahood in the same truth. Not only has the Law been proclaimed by the Law-born Buddhas,[4] but they all have one and the same road to tread. This one road (*ekayāna*)[5] consists in nothing but reverence towards and realization of the Law. Herein lies the very essence of the teaching of all the Tathāgatas, or, speaking metaphysically, their entity—*dhammatā*[6] or *dhammassa sudhammatā*.[7] In this concept of the essence of Buddha's teaching or Law, and consequently of his personality as the Law-born, the Buddhist philosophers have found a metaphysical basis for their faith in Buddha as the *dhamma*-born. They were to find, by the help of this idea, a metaphysical unity in the communion of all the Tathāgatas. It is quite natural that Nāgārjuna,[8] the Mahāyānist philosopher of the 2nd cent. A.D., founded his theory of Buddha's *dharmakāya*, or *dharma-ātmā*, upon this concept of *dhammatā* and the authority of the verses speaking of the *ekayāna*, above referred to.

(3) This point gives us a key to the consideration of Buddhological speculation on the eternity of the Tathāgata's life. Whether the Tathāgata exists after his bodily death or not is a question that had been asked from very early times in Buddhist history. Buddha is said to have neither affirmed nor denied it.[9] It is remarkable that every time this question is asked Buddha is named by the epithet Tathāgata. Whatever this connexion may have implied, we see that the question is affirmed on a metaphysical basis in the Mahāyāna texts, and that here again the appellation Tathāgata comes most conspicuously to the front. We have two most important texts, which devote each a whole chapter to the question of the duration of the Tathāgata's life (*Tathāgata-āyuṣ-pramāṇā*)—the *Lotus of the Law*[10] and the *Golden Light*.[11]

[9] A whole chapter called the *Avyākata*, 'Undefined,' *Saṃyutta*, xliv., is devoted to the question; cf. *Saṃyutta*, xxii. 85 f., xxiv. 15–18, xxiii. 1–10; *Majjhima*, nos. 63, 72, etc.
[10] *Saddharma-puṇḍarika*, *SBE* xxi. ch. xvi.
[11] *Suvarṇa-prabhā* (ed. Chandra Das, Calcutta, 1898), pp. 3–9

The first of these texts expounds at length the transcendental side of the Buddhological speculation, and the chapter above referred to may be taken as the conclusion of the exposition. Though the whole text seems to be a composite one, made up of heterogeneous elements, a definite line of argument may be found from its opening up to ch. xv. Ch. ii., entitled 'Tactfulness,' gives a view of the Buddha's personality as a skilful and tactful teacher of the Law, who, being versed himself in the deepest truth, knows how to guide men to enlightenment and how to carry out the one vehicle.[1]

The Tathāgata is a perfect being who knows all and is perfected in all virtues.[2] 'The Tathāgata only can proclaim the Tathāgata's Law, those laws which the Tathāgata knows. And the Tathāgata knows all laws, *i.e.* what are (*ye te*) the laws,[3] how (*yādṛśās*) they are, of what characteristics (*yallakṣaṇās*) they are, of what essence (*yat-svabhāvās*) they are. In these laws (*i.e.* truths) the Tathāgata is versed face to face. . . . Believe me, I speak what is real, I speak what is truthful, I speak what is not otherwise (*bhūtavādī, tathāvādī, ananyathāvādī*). . . . Having seized the one vehicle (*ekayāna*) I proclaim to beings the Law, the Buddha-vehicle; there is no second vehicle, nor a third. This is the nature of the Law (*dharmatā*) universally in the worlds in ten directions. All the Tathāgatas of the past, of the future, as well as of the present, proclaim the same one vehicle.'

After elucidating this mastership of the one vehicle by two parables, the text proceeds, in ch. v., entitled 'On Plants,' to reveal the entity of the Tathāgata's personality and his omnipotent powers. The Tathāgata who knows all *dharmas* is identified here with the *dharmas* themselves, or rather all the *dharmas* are concentrated in, and derived from, the personality of the Tathāgata. He is the king of the Law, as is stated in the *Nikāya* texts. But the king is not a mere legislator: he is the very entity of the laws.

'Whatever law for any case is laid down by the Tathāgata it becomes really so. The Tathāgata aptly ordains and lays down all laws. By the Tathāgata-wisdom he lays down the laws in such a manner that they enter into the position of omniscience.'

The Tathāgata is such a being because his omniscience, the *Tathāgata-jñāna*, is the very essence of all the laws, the real metaphysical foundation of all their manifestations. The saying that one who sees the Tathāgata sees the Law finds here a metaphysical interpretation, illustrated by a parable of rain which nourishes all plants, each according to its capacity and nature.

The discourses and dialogues following this chapter try to disclose the mysteries of Buddhahood. It is explained as of remote origin and in communion with all the enlightened of the past and future. The person of the Buddha, who was born among the Śākyas, and who has attained Buddhahood at Gayā, is nothing but a personal revelation of the eternal *dharmatā*,[4] *i.e.* the Tathāgata.[5] This faith is illustrated and supported figuratively by the issuing of innumerable saints out of the earth. The idea is that these saints cannot be the Tathāgata's disciples, unless he is Buddha from an infinite past. The argument reaches its climax in ch. xv., entitled 'The Duration of the Tathāgata's Life,' which brings to light the true measure of the Tathāgata's life. A corporal manifestation of the Tathāgata is for the benefit of those who need to be educated in that way. In reality he was perfectly enlightened long ago (*chirābhisambuddha*), and he is everlasting (*sadā sthita*). Therefore the Tathāgata declares, at the close of the chapter, that he knows eternity. Then he proclaims to all beings: 'I am the Tathāgata' (*lect. var.* 'I am thus and thus,' *tathā tathā 'ham*).

In the *Golden Light* it is first asked why the life of Śākyamuni lasted only eighty years. Buddha answers by affirming the immeasurableness of his life. All the saints and celestial beings utter verses praising and adoring the Buddha of an immeasurable life. Here we shall give an abstract of the verses, which are indeed the statement of a metaphysics of the Tathāgata. They say:

Hearken, unimaginable is the entity of the Lord of the world, the Tathāgata, who proceeds according to reality (*yathā-ākrama*). All the Buddhas are equal in their virtue, having the same *dharmatā*. The Tathāgata is unoriginated, and our Master is not a conditioned being. The Perfectly Enlightened has the Law as his body (*dharma-kāya*),[6] the Tathāgata has the Law as his realm (*dharma-dhātu*). Neither does the Buddha vanish nor does the Law perish, yet he shows extinction, in order to bring the beings to perfection. Unimaginable is Buddha, the Blessed One; the body of the Tathāgata is eternal; for the sake of compassion towards all beings he manifests himself in various appearances.

Here, as in the *Lotus*, remains a problem to be elaborated—the question of the relations between the unchangeable entity of the Tathāgata and his manifestation. A Chinese version[7] of the text, produced by I-tsing, adds a chapter after these verses, and it treats of the three bodies (or personalities) of the Tathāgata. This may be the work of a commentator, but it indicates how the Buddhological speculations have been closely connected with the appellation Tathāgata.

[7] Nanjio, no. 126.

In summing up these ideas we may see that with the Buddhists the Tathāgata has meant the personal aspect of the *dharma*. To found metaphysical ideas upon faith in the person of the Tathāgata has always been the task of Buddhist orthodoxy, even in its phases of development in the East. But, in addition to this, we should consider two currents of thought which flowed beside the central one. (*a*) One of them is the theory that denies personality in the Tathāgata or anything else. It may be designated the theory of 'no-sign' (*alakṣaṇa*) and is represented by *The Diamond-cutter*[1] and other texts of the so-called Prajñā class. There the person of Buddha remains as the preacher of the sermons, and the epithet Tathāgata remains also; but nothing is allowed to be defined, any definition or qualification being thought to be a limitation, which means the same thing as illusion. Thus the texts which assert the omniscience of the Tathāgata deny to him any ascribable quality (*lakṣaṇa*). 'Tathāgata means one who does not go to anywhere, and does not come from anywhere.'[2] Here we see that the very idea of Tathāgata is put away. Nevertheless, in the midst of thorough negations, the identity of the Tathāgata and the Law is asserted.[3] This is indeed a testimony to the tenacity of the idea.

(*b*) Another current, opposite to the above, may be called the theory of 'signs' (*dharma-lakṣaṇa*). In its theoretical aspect this doctrine cannot be distinguished from orthodoxy, being founded upon the idea that all the *dharmas* are realities, which are realized in the person of the Tathāgata. But in practical aspects it looks to a Tathāgata beside the historical Buddha. Amitābha, the lord of the Sukhāvatī, or Vaiśā-jya-guru, the lord of the Eastern paradise, or Maitreya, the future Buddha in the Tusitā heaven, is the object of their adoration and their hope of salvation. The cult of the Tathāgatas in various heavens is found also in the *Lotus*,[4] and it has proved to be useful for propagandism. Buddhism of this kind, whichever may be its Tathāgata and ideal heaven, is founded upon the belief that any Buddha or saint is the manifestation of the one Tathāgata. This philosophy of the *dharma-lakṣaṇa* is a natural outcome of the early Buddhist concept of *dhamma* and is in conformity with the faith that every *dharma* is the manifestation of Buddha's wisdom (providence, so to speak). Moreover, the religion of adoring this or that Buddha as the being of compassion or as our saviour is not only in accordance with the philosophy, but also has a very sympathetic aspect of faith and piety. But the defect of this system lies in its losing concentration of faith in the historical Tathāgata and therefore in its running sometimes to an extreme pantheism.

To sum up the results: Buddhist philosophy started with the ideal of release from the miseries of life in conformity with the real nature of things (*dhammā*). As the reality, so the existence (*yathā dhammā tathā sattā*). This *yathā tathā* has been revealed by the Tathāgata, whose personality consisted in *yathā-vādī tathākārī*. This Buddha's personality is inseparable from the metaphysical entity of *dhamma*, and *vice versa*. The idea of the Tathāgata has, in this way, become the pivot around which both philosophical speculations and religious faith have moved and developed.

[4] Ch. xx.

TATI BUSHMEN.—1. Race and distribution.—The Tati Bushmen, called by the Bechuana Masarwa, and by the Matebele Amasile, are a branch of the Bush people of S. Africa, with whom they have many characteristics, both morphological and linguistic, in common.

The Bushmen in general were formerly spread over a much larger area of the continent of Africa than they occupy at present. Traces of their occupation, such as paintings, weapons, and implements, have been found far beyond their present limits. Indeed there is good reason for believing that at one time they occupied practically the whole continent and were driven by other peoples into their present territory. They are considered therefore by most anthropologists to be the true aborigines of S. Africa. In their legends they speak of a time when they were the only inhabitants of S. Africa. Paintings in the W. Sudan, in the caves of Algeria, and in Central France are strangely reminiscent of the Bushman paintings of Rhodesia or Cape Colony. The Grimaldi race, who inhabited some of the European caves in Aurignacian times, may have been either the ancestors of the Bushmen or a portion of the people who crossed over into Europe probably as slaves of the Cro-Magnon race. The Bush people are now confined to the country west of the Drakensberg Mountains and south of the Zambesi River to the Atlantic Ocean, but are principally found in the northern parts of Cape Colony, the Bechuanaland Protectorate, S.W. Protectorate, and S. Rhodesia. There are few, if any, Bushmen between the Drakensberg and the Indian Ocean, and not many in the Transvaal. So far as is known, there are none north of the Zambesi. From the Bantu traditions they must be recently extinct in N. Rhodesia and Nyasaland.

The Bushmen are divided into many different tribes and clans, speaking languages differing widely from one another, but all of the same general type. According to Meinhof,[1] the Bushman tongues are purely isolating and have their closest relations among the isolating languages of the W. Sudan. While this is true to a certain degree so far as the language of the Tati Bushmen is concerned, it is too sweeping a generalization in the present state of our knowledge. The Tati Bushmen inhabit the country between the Zambesi and the Crocodile Rivers, from the Transvaal and S. Rhodesia on the east to Lake Ngami on the west. They are fairly tall, 5 ft. 3 in. being the average stature of the men, while they are much darker in colour as a whole than the southern Bushmen. The Cape Bushmen seldom exceed 5 ft. in height, the average stature being 4 ft. 9 in., and are dirty yellow in colour. Among the Tati Bushmen some individuals attain a height of 6 ft., but they are rare. The face of the typical Bushman is triangular in outline, flat in appearance, with weak chin, depressed nose, and prominent cheek-bones. The ears usually have no lobes, the hair is thinly scattered over the skull in small tufts, there is little or no beard, and the whole appearance of the face is wild and foxy. Most of these characteristics are shared by the Tati Bushmen. Their bodies are small but tightly built, and they are seldom fat. Steatopygy is common among them, as among the southern Bushmen. The whole Bush population of S. Africa probably does not exceed 10,000, of which the Tati people may number 1000. They are a fast vanishing race.

2. Culture and organization.—The Bushmen, as their name (originally given to them by the early Dutch settlers) implies, are a people of the open country, a race of hunting savages living largely in the Stone Age. Their love of freedom amounts to a passion, and they are passionate, irresponsible, courageous, and cruel. Consequently they have practically no tribal organization, and very little clan system, except in the sense that a particular portion of country was the possession of a certain clan, the families of which, under the leadership of a man of known prowess, would combine to defend it against intruders. But usually all that obtained was that the various families combined in the face of danger, under the strongest and most capable leader, and, once that passed, the combination came to an end. They do not cultivate the soil and have no domesticated animals except dogs. They therefore depend entirely upon the chase. Their dwellings are caves or holes in rocks, or shelters made of a few branches stuck in the ground, with skins or mats thrown over them, which they carry away with them when they migrate from the district. Their material civilization is thus very meagre, being restricted to what is absolutely necessary for the capture and cooking of game. A little coarse pottery is or was made, while ostrich egg shells are used to hold water. Beads of dried wild berries and necklaces made from disks cut from ostrich egg shells are worn by both men and women. Ear-rings made from pieces of bone or wood, or—since the white man came to the country—of metal, usually brass, are common. Leather arm- and leg-rings, together with fillets of skin round the head, into which are stuck ostrich and other feathers, are also worn. Clothing is scanty and generally consists of the skin of an animal thrown over the shoulders in cold weather. The women wear a small piece of skin with fringes in front, while the men are content with a narrow piece of skin passed between the legs and tied round the waist with sinew or cord. Children of both sexes go naked. In warm weather to prevent the sun from blistering the skin, and in winter to keep out the cold, they smear the body with fat, often rancid, so that they smell very offensively. Weapons of war and the chase are spears, bows and arrows, and throwing-sticks. The tips of the arrows are smeared with poison made from the Bushman's poison bush (*Acocanthera venenata*) and the two-rowed Amaryllis (*Amaryllis distichia*), mixed with snake poison, and in some cases with poisonous ants. The food of both sexes consists of the flesh of animals, locusts, larvæ of ants, called 'Bushman rice,' gum, and various tubers and seeds. For the collection of tubers an implement called the */kibi* or */kwe* is employed. It is a stout stick about 3 ft. long, upon which a round flat stone with a hole in the centre is fastened about 9 ins. from the end. This is the well-known digging stick, which is also used to excavate graves.

3. Mentality; artistic and moral life.—The Bush people as a whole are low in the scale of mental acquirements. They have an extensive knowledge of the outdoor world, especially of the habits of wild animals. They are wonderful as trackers and have a remarkable sense of direction. Their reflective faculties are not highly developed, although some of their paintings, and more especially their folk-tales and songs, are not wanting in this respect. The most interesting thing about the Bushmen is their artistic ability. They have left paintings upon the walls of caves and rocks and incised figures upon boulders all over the country. Most of these paintings or chippings indicate objects of the chase, the habits of animals,

[1] C. Meinhof, 'The Language of the Hottentots,' *Addresses and Papers read at the Joint Meeting of the British and South African Associations for the Advancement of Science*, South Africa, 1905, lii. 198.

or more rarely scenes of war and domestic life. The drawings of the wild animals are in many cases really well executed, though one can trace in places the gradual evolution of the art of painting. A fresco recently discovered in the Matopo Hills near Bulawayo is remarkable for its artistic merit. There is not much perspective in most of the paintings, while the execution as a whole reminds one of the paintings of the Old Stone Age. Certain paintings of figures are supposed to have a mythological signification, as they cannot be connected with animals or circumstances of the present day. Some caves were called after particular paintings—*e.g.*, the Cave of the Great Serpent, the Cave of the Lion—and hence were held in a certain degree of reverence by the people. To such caves they would periodically return as to a rallying-point to talk over their wild adventures. It has been suggested that the art of the Bushman is due to sympathetic magic, that this was the idea underlying it—in other words, that the Bushman painted the animals on the walls of his cave-dwelling to give him power over them in the field. While this is possible, and may be probable in some cases, there is not any good evidence of it. It has been maintained that paintings usually depict animals desirable for food, and that noxious animals are conspicuous by their absence. So far as Bushman paintings are concerned, this is not true. If animals such as lions, leopards, snakes, and rhinoceroses are to be considered noxious animals, they occur often enough on the paintings. But such animals are not undesirable as food to the Bushmen, as they eat practically everything, and certainly would not refuse to eat the flesh of a lion, unless it happened to be the totem of the hunter. On the whole the paintings reflect no more than the ordinary life of the people *plus* the caprice of the particular artist. At intervals of leisure—and the Bushmen, when food was plenty, had much of that—the scenes of the past would rise up in their minds, and they would attempt to visualize them by painting them on the rock, and by constant practice the faculty of drawing improved. The colours employed were yellow, brown, red, and sometimes white, and blue. Some of these paintings are ancient, and some are quite modern, as certain of the artists are or were recently alive. The faculty of drawing and painting was said to be hereditary in certain families. The theory has been advanced that the painters and sculptors belonged to different tribes, but there is no good reason for accepting this.

The Bushmen are passionately fond of dancing, more especially at full moon and at certain seasons of the year. Fires are lit outside their caves, and dancing is kept up all night, or until the performers are exhausted. Some of these dances, in which the performers paint their faces and bodies, are of a religious nature. Some of them are more or less coarse. Songs are sung by the leaders, and the other performers join in the chorus. The motions are not at all graceful. Some dances are called after animals—*e.g.*, the eland bull dance, the baboon dance, the bee dance, and the frog dance—and each has its own peculiar tune. The dancers give very good imitations of the animal in its different attitudes. The instruments used to accompany these dances are stringed instruments similar to an ordinary bow, with a tortoise-shell as a sound-box variously called *!kopo*, *!kangen*, and ‖*gora*, 'reed,' 'flutes,' and 'drums.' The dancers have rattles round their ankles, made of the skin of the inside of the springbok's ear, with small pebbles inside to make as much sound as possible. Circumcision dances are performed after the boys have undergone the ceremony. These are of a distinctly religious character. Bushman music is, as might be expected, of a very primitive character—the melancholy and monotonous repetition of a few notes. It does not usually consist of more than six tones (which do not belong to our scale), but the strangeness and wildness of the melody give it a peculiar charm. There are other tunes which show some advance, especially one by the Natal Bushmen. Harmony does not exist.

The Bushmen have an extensive range of terms for family relationships, both male and female. Some of these are connected with tabus; *e.g.*, a mother-in-law must not see her son-in-law or mention his name; he, on his part, must not mention hers. The same rule applies to some other relations also. A woman must avoid mentioning the name of her husband or any of his near relatives. There are different terms for these relationships, but the system among the Bushmen is not nearly so perfect as that among the Australians.

Marriage is usually a very simple matter among the Bushmen, some of whom are monogamists and some polygamists, according to their individual worldly position. Two young people very often simply go off and live together, but usually the young man has to prove his prowess by going into the veld and slaying some wild animal—the strongest and fiercest he can find—and presenting the whole or a selected portion to the girl's father. Among some tribes this is considered indispensable before asking the hand of a girl in marriage. If the present is accepted, the marriage is complete. Sexual intercourse before marriage, while looked upon as a crime, is very often practised. Divorce too is simple. A man or woman leaves his or her partner and goes off with some one else. The custody of the children does not cause much trouble, as the young people are accustomed to fend for themselves at an early age. Parental control is thus exceedingly weak. Marriage usually takes place within the clan, but a man cannot marry a woman of the same family as his own—*i.e.* bearing his own surname. So far as we know, a man cannot take his own sister to wife, because of his totem, but he may take his sister-in-law. Although there is much freedom in the intercourse of the sexes, incest and adultery are regarded as crimes and are punished by death, usually by retaliation on the part of the injured person. Murder, theft, abduction, and especially witchcraft, are crimes against the Bushman moral code and are punished by fines, expulsion from the tribe, or even death in the case of persistent offenders. The old people, when too infirm to follow the family in its wanderings or unable to procure food for themselves, are left to die.

4. Totemism and religion.—As has been remarked, totemism exists among the Bushmen, especially among those tribes that have had long contact with the Bantu peoples, but they are too much the children of the wild to have developed it to any extent. Some call themselves the Zebra clan, or the Eland clan, or the Duiker clan, and, while they avoid killing and eating these animals or certain portions of them, they are not at all strict about the matter when pressed by hunger. In the case of the Duiker clan, the members may eat all of the animal except the heart. Those clans whose totem was the buffalo did not scruple to eat every portion of a domestic ox, although they might not eat every portion of a wild buffalo, even though they looked upon oxen as tame buffaloes.

They believe in a spirit which the northern tribes call Thora, and the southern !Kang or ‖Kaggen.

W. H. I. Bleek,[1] J. M. Orpen,[2] and others think that ǃKang is simply the mantis insect, for which they have a great reverence, but there does not seem to be great force in this contention. While it may be true of the Bushmen of Cape Colony, it is certainly not true of the Tati Bushmen. These tribes say that Thora is a spirit, that he sends the rain, the lightning (of which they are very much afraid), good weather, bad luck, and plenty. They are not very clear as to whether he is a person or not, but he is usually spoken of with dread, as a malevolent spirit, with whom it is advisable to keep on good terms. They also say that he made the animals, but they are not sure if he made the first men. The Tati Bushmen reverence the mantis to a certain extent, and do not like killing it if they can help it. All Bushmen have a great dread of death, and in common with many peoples believe that it is due to bewitchment by an enemy. Arbousset,[3] speaking of the Bushmen of Basutoland of his day, says that they looked upon death as a sleep. It is difficult to ascertain what they do really think on the subject, as they are so unwilling to speak of it at all. They also believe in some form of future life, but do not know what it is really like. They imagine that it does not differ much from the present life. This is shown by the burial customs of some tribes. They used to drag their dead into the surrounding bush to be devoured by wild animals, but generally they bury the bodies in a hole or cleft in a rock, which they carefully wall up, or they excavate a round hole about 3 or 4 ft. deep and place the dead man at the bottom in a sitting or lying position, with the legs doubled up to the chin, and in each case place beside him some food and his weapons of war. They generally indulge in a funeral feast afterwards, desert the locality, and never mention the dead man's name. Why they keep silence regarding the departed they cannot explain. Some tribes place the dead with his face to the rising sun; others observe no such custom.

The Tati Bushmen have no regular priests, but they have certain individuals, whom they call doctors, who possess a considerable knowledge of the properties and uses of wild plants, and thus exercise great influence over the people. This knowledge is sometimes confined to certain families, who jealously guard it. They have a considerable knowledge of vegetable poisons and have antidotes for them. Malicious poisoning does not often occur among them. Bushman doctors profess to cure malaria, typhoid, blackwater fever, dysentery, and other diseases, and, according to reliable information, are often successful. Most of the plants which they use are employed in religious ceremonies or in ordeals and trials for witchcraft. In fact, much, if not all, of the Bushman practice of medicine has a religious signification.

The Tati Bushmen, in common with most other Bushmen, practise circumcision. At present they perform the rite according to the Bechuana custom. Boys are operated upon at about the age of twelve years, development being rapid with them. A stone knife was formerly employed and still is by most tribes—a matter of necessity at first, but now a matter of custom, or of hygiene, as the knife is thrown away and a new one made for each ceremony. A number of boys of approximately the same age are operated upon at once. The method is as follows. The foreskin is pulled forward over the glans as far as it will stretch and then cut off with one slash of the knife. It quickly retracts and so prevents excessive bleeding, and usually heals rapidly. It is not known for certain whether the girls underwent the rite or not. The southern Bushmen cut off the last joint of the little finger of the right hand in the case of boys, and of the left hand in the case of girls. This was also a religious ceremony, but whether it took the place of circumcision or was additional thereto is still uncertain. Cutting off the joints of one or more fingers was also practised as a sign of mourning. The Tati Bushmen, whatever they may have done in the past, do not now practise finger-cutting.

5. **Omens.**—The great factor in the life of the Bushmen is their divining bones, commonly but erroneously called dice. The Bushmen would undertake no expedition without consulting them. They are four and sometimes five in number, and designated male and female. The female bone is usually longer than the male. They are made from the hoofs of animals, bone, horn, wood, or even the stones of wild fruits. Sometimes they are ornamented with designs on back or front. To consult them a man would clear a small space of ground, rub the bones with various kinds of medicine, blow upon them, and then cast them upon the ground. From their positions and conjunctions he divines what he wants to know, according to certain laws. If the result is unfavourable, it is useless for him to persevere in his object. Divination is also practised by means of the shoulder-blade of a springbok, and by certain other animals, such as the mantis, lion, jackal, and snake.

6. **Spirits.**—The Bushmen personify some animals and look upon them as men in another state of existence. They also believe that men, especially witch-doctors, can assume animal shapes at will and compel other people to do the same. This, they say, is to 'have power' over such victims. It has been held to indicate a belief in the transmigration of souls, but the point is very doubtful. They certainly believe in transformations of animals. The Tati Bushmen thoroughly believe in the existence of spirits, usually of a malevolent character, and, when closely questioned, admit that they can change their shapes at will, but they do not seem to believe that these spirits can be born again into other animal shapes. Lightning, wind, eddies of dust, storms, and other natural phenomena are looked upon as spirits. This is probably a relic of primitive man's belief that the animals and things about him were not different from himself—certainly to some extent the Bushman view. There are spirits of rivers, fountains, and thermal springs known to the Bushmen and much reverenced by them.

7. **Mythology of the heavenly bodies.**—The Bushmen have no regular system of mythology in the sense that the ancient Greeks or the modern Hindus have, but they have the elements of such. They are said to have worshipped the heavenly bodies and are therefore to be included among those people who attained to sidereal worship. Among the Tati Bushmen no special ceremonies are connected with these bodies, although it is evident from numerous tales in which the sun and moon appear that a considerable degree of reverence is paid to them. The new moon figures in many of their tales.

The moon is the shoe of the mantis. Her waxing and waning is explained as her dying and coming to life again. The Tati Bushmen have some of these tales in a more or less modified form; *e.g.*, one speaks of the moon coming down to wash her face in a pool of water. The Bushmen do not know why the sun is hot, and why there is no heat in the moon. Among the southern Bushmen the sun is spoken of as a little boy by the wayside; sometimes he is said to have been thrown into the sky by some children while he was sleeping. Again, the moon is spoken of as being cut by the sun and after death

carries away the people who are dead. Some of the Tati Bushmen say that the stars were once human beings and animals, and the Cape Bushmen speak of girls as having been turned into stars and flowers by the rain. Certain prominent stars have particular names among the Bushmen; *e.g.*, Jupiter is the Dawn's Heart; the Magellanic Clouds the Male and Female Steinbok, the Southern Cross the Giraffe Star (Tati Bushmen), Aldebaran the Male Hartebeest, Procyon the Male Eland, Orion's Belt the Female Tortoises. The origin of the stars is explained in the following manner. A girl of the early race, being angry with her mother because the latter asked her for a certain kind of food which she had put to roast in the fire, threw it together with the wood ashes that were upon it into the air. The food was changed into stars, and the ashes became the Milky Way. The rising of particular stars at certain seasons of the year was noted, as they were connected with the return of the seasons. Shooting stars were considered unlucky by the Tati Bushmen, and, if they appeared in great numbers, inspired terror.

8. **Folk literature.**—The Bushmen have a great body of folklore, mostly relating to animals and natural objects, customs, and so on, but next to none of a historical character, certainly none that throws much light on their origin and migrations. Not a tithe of those folk-tales have been garnered, and, as the race is a fast vanishing one, they will soon be completely lost. Bleek collected a large number of tales, and a selection from his great mass of materials was published in 1911 by his niece, Miss Lloyd. Smaller collections by Schultze, Theal, and Dornan have been issued. A study of these tales throws much light on the mental and moral outlook of the Bushmen.

S. S. DORNAN.

TATUING.—The word 'tatu' or 'tattoo,' meaning to mark or puncture the skin, is derived from the Tahitian word *tatau*, a reduplicated form of the root *ta*, 'to strike.' It was used by Captain Cook in the account of his visit to Tahiti:

'Both sexes paint their Bodys, *Tattow* as it is called in their Language. This is done by inlaying the Colour of Black under their skins in such a manner as to be indelible.'[1]

Cook was thus the first to introduce the word to the civilized world of his day. Many writers since his time have included in the general term 'tatu' the practice of marking the skin with cicatrices; the two processes are, however, very different. Tatu proper is the insertion of pigment under the skin, whereby a practically permanent stain is produced, while cicatrization is the marking of the body, either by cutting or burning the skin in such a way as to cause scars forming small depressions or by cutting into the skin and keeping the wounds open, so that keloids, or raised scars, are formed, which stand out prominently from the surrounding tissue.

[1] *Journal during his First Voyage, 1768–71*, ed. W. J. Wharton, London, 1893, p. 93.

1. **Antiquity and distribution.**—Both these modes of personal decoration are of considerable antiquity and of wide distribution; they have been found among people of greatly varying culture, from the aborigines of Australia, who adorn their bodies with cicatrices, to the Polynesians and Japanese, who have developed tatu proper into a fine art. At a very early stage man no doubt felt a desire for personal decoration and learnt to use pigment for this purpose; and it is possible that tatu was resorted to as a means of giving a permanent character to the designs thus made to beautify the body at a stage prior to the use of clothes. Archæological evidence can, unfortunately, give us no direct proof of the existence of such a custom as tatu in pre-historic times, but it is well known that Aurignacian man was skilful in the use of colour. Déchelette suggests that the finely pointed implements found in Magdalenian deposits may have been used for tatuing. Referring to the practice among primitive peoples of cicatrization and tatu, he says:

'Les premiers habitants de l'Europe préhistorique s'ornaient le corps à l'aide des mêmes procédés, mais en général il nous est impossible de distinguer nettement pour cette période entre la teinture corporelle simple et le tatouage. C'est là un fait établi par des preuves indirectes mais décisives pour la fin des temps quaternaires, pour l'époque néolithique et le commencement tout au moins de l'âge du bronze.'[1]

In the pre-dynastic tombs of the old Egyptians excavated by Flinders Petrie, de Morgan, Amélineau, and others, some rude human figures have been found bearing marks that suggest the use of tatu—*e.g.*, the female figure discovered at Tukh.[2] In the second Theban empire the Egyptians tatued themselves on the breast or arms with the names or symbols of deities, but decorative tatu marks are rare on Egyptian remains of the classical period.[3] The prohibition in Lv 19[28], 'Ye shall not make any cuttings in your flesh for the dead, nor print any marks upon you,' indicates that the Jews had seen these practices carried on by the heathen nations among whom their lot was 'cast, and perhaps had themselves adopted them.

There are many classical allusions to tatu in Europe. Herodotus writes of the Thracian women being tatued as a sign of nobility.[4] Pliny[5] says that the men of the Dacians and Sarmatians marked their bodies ('corpora sua inscribunt'). That tatu was known to the Pictones and other tribes of Gaul is shown by the evidence from coins.[6] Chinese tradition says that the great Chinese hero Tschaipe found tatu among the Ainus of Japan, who indeed practise it to this day. In China it ceased at a very early time to be a desirable mode of decoration and survives only as a method of imposing a distinctive mark. A. T. Sinclair says that 'among the ancient natives in the West Indies, Mexico and Central America, tattooing was general if not almost universal.'[7] It was also practised by the early inhabitants of S. America, as notably among the coastal tribes of Ecuador and ancient Peru.[8] G. Elliot Smith finds it along the coast-lines of a great part of the world and includes it in the culture-complex of the 'heliolithic' track.[9] Darwin, in drawing attention to the universality of the custom among primitive peoples, said: 'Not one great country can be named, from the Polar regions in the north to New Zealand in the south, in which the aborigines do

not tattoo themselves.'[1] W. Joest goes so far as to say that no race or people exists that has not had the custom of either painting or tatuing the body.[2] On the other hand, some investigators have failed to find traces of cicatrization or tatu among certain primitive tribes, such as the Vedda of Ceylon,[3] the Mafulu of British New Guinea,[4] the Tati Bushmen,[5] and others; but this negative evidence does not rule out the possibility that such practices were once known to these people and have become lost arts. Cicatrization is mainly confined to dark-skinned races, while tatu proper prevails with those of lighter colour. Thus we find cicatrization in Australia, Tasmania, New Caledonia, Fiji, and other parts of Melanesia, in Torres Straits islands, among the Papuans of New Guinea, in the Malay Peninsula (Sakai), the Andaman Islands, and in negro Africa. It has been superseded in S. America by tatu proper, but has been observed among the Caribs of Guiana and in Brazil. The light-coloured races who have practised tatu proper include the Maoris of New Zealand and the inhabitants of the other islands of Polynesia. It is also found in Melanesia, Micronesia, the Malay Archipelago, the Malay Peninsula, Burma, India, among the Tibeto-Burman peoples in general (but rare in Tibet), and in Japan. In Africa it is found in Algeria, in Egypt, among the For, the Tushilang, the Namaqua Hottentots, and other tribes, but it is by no means so widely distributed in this continent as cicatrization. On the other hand, tatu proper was very prevalent in the New World, especially among the Indian tribes of N. America, such as the Iroquois, the Pricked Pawnees, the Delawares, and others. It is used extensively at the present day by the Haida Indians of the N.W. American coast, and also by the Eskimo, and in S. America, notably among the Mundrucu and Guaycura tribes.

Tatuing is said to be one of the chief occupations of the Oriental gypsies. Sinclair found that most of the tatuing among the lower orders in Syria, Mesopotamia, Arabia, Egypt, and some parts of Persia was done by them. They also tatu themselves, and in this they differ from European gypsies, for these do not wear tatu marks. 'Hence their tattooing is an easy mode of identifying Oriental gipsies, who are often seen in all parts of Europe and America.'[6] At the present day tatuing persists in Europe among the lower classes. Lombroso made a comparative study of tatu among soldiers and criminals, and concluded that it was especially prevalent among the latter. He noted that the designs in criminal tatu are often extremely complex and of a cynical and obscene character.[7] There was a considerable revival of tatu among the soldiers and sailors serving with the British forces in the recent war. A revival, too, has been evident in Japan since 1881, when tatu ceased to be a penal offence and came once more into vogue, with the result that it is now an elaborate art.[8] Apart from these and similar isolated revivals, tatu is, on the whole, rapidly declining, especially in Polynesia, once the centre of a highly developed system of tatu. This change is due, no doubt, in a great measure to the action of the missionaries, who have discouraged the practice, because of the orgies that often accompanied the tatuing operations.

2. Methods and implements.—The methods and implements used to produce these marks on the body vary considerably in different parts of the world and often reflect the cultural conditions of the people among whom they have been found. It is impossible here to do more than indicate briefly some of the more striking variations of the processes which have been recorded and add a few examples by way of illustration.

(*a*) *Cicatrization.*—In Central Africa prominent keloids are formed by detaching a piece of skin, which is raised and held by a pellet of tow till the wound is healed. A. L. Cureau alludes to 'dandies of the Upper Ubangi and Equatorial Congo' who undergo this operation as a means of obtaining 'the prominent crest which gives them a fierce expression.'[1] Irritant substances are sometimes rubbed into the incisions to prevent the wounds from healing too rapidly. Among the Bageshu, a Bantu people on the south and south-east slopes of Mt. Elgon, the girls use a crescent-shaped flesh hook sharpened to a needle point at one end. Scars are formed on the forehead and stomach by pinching up the flesh between the thumb and finger and running the hook through it; fine dust from a wood fire is then rubbed into the wounds.[2] Natives from the interior of Mozambique wear marked *rugæ* on the forehead.

These are formed 'by making vertical incisions in the skin, rubbing in a medicine, and then binding tightly with a cloth, so that wrinkles are formed in the line of the incision.'[3]

Cicatrization begins with the Andamanese at the age of eight and continues at intervals until the sixteenth or eighteenth year is reached. It is usually done by women, who use a flake of quartz or glass held between the forefinger and thumb. The arms and back are marked first, while fasting, and afterwards the chest, abdomen, and legs, but never the face; the special tribal marks are, in some tribes, made by men with a pig arrow. Pork is not eaten while the wounds are healing; and the northern tribes have certain ceremonies connected with the operation.[4] The aborigines of Central Australia cut the skin with flakes of flint or glass and rub in ashes or the down of the eagle-hawk.[5] At Port Essington (N. Territory of Australia) scars are formed by burning the flesh with a red-hot stick.[6] In N.W. Queensland they are made by lighting charcoal on the flesh and allowing it to burn there. The implements used in Melanesia differ in different islands; *e.g.*, in the Solomons the circular or chevron-shaped cicatrices worn by both sexes on the face are made with the claw of the flying fox,[7] while in Florida Island the pattern is 'marked out in circles with a bamboo, and the skin is cut with the bone of a bat's wing.'[8] The keloids and scars called *kotto*, which are customary in New Britain, are made with obsidian flakes.[9]

(*b*) *Tatu proper.*—A method which seems to suggest a combination of cicatrization and tatu proper is that of cutting the flesh and rubbing pigment into the wounds. Livingstone says of the Makoa (Makua) of Central Africa, who have double lines of keloids on the face: 'After the incisions are made, charcoal is rubbed in and the flesh pressed out, so that all the cuts are raised above the level of the surface.'[10] The charcoal gives a bluish tinge to the skin, 'and the ornament shows brightly in persons of light complexion, who by the by are common.'[11] The Ainu women of Yezo (Japan) cut gashes on the face with a sharp knife and rub in soot from burnt birch-bark, which

produces a bluish-black effect.[1] This method has also been observed in some of the islands of Micronesia.

The implements used for pricking the skin range in complexity from such simple natural objects as thorns, fish spines, cactus spikes, shells, and bones, to the elaborate metal appliance of the Burmese and the steel and electric needles of Japan and Europe in use at the present day. The Roro-speaking tribes of British New Guinea obtain the desired effect by very simple means. The operator, who is generally an old woman, applies colouring matter—soot mixed with water—with a fragment of wood frayed out at one end to form a coarse brush. The colour is pricked in by means of a pricker having one or more thorns set at right angles to its long axis; these thorns are driven into the skin by tapping the pricker gently with a small wooden mallet. The women of these tribes are tatued from head to foot, but the operation takes place at intervals, and there is a regular order in which the different parts of the body must be tatued; thus the hands and arms are done in childhood, and later the tatu is gradually increased until at marriageable age it is applied to the buttocks, legs, and last of all to the face.[2] The Polynesian method of tatuing is generally to trace the design on the skin first with charcoal and then to follow the pattern with a small adze-shaped implement furnished with a serrated bone edge. The skin is perforated by hammering or tapping this implement with another made of wood and shaped like a paddle. But the ways and means employed vary a good deal in the South Sea Islands, and the operation is often accompanied by much ceremonial and feasting, and the keeping of certain tabus; *e.g.*, brides in the Fiji, while being tatued, are *tabu siga*, and are kept in seclusion, for they must not see the sun.[3] In New Zealand a very strict tabu has to be observed by the person undergoing the ordeal; he may not communicate with any one not in the same condition, nor may he touch his food. The Maori chief had to be fed through a special funnel during the process, which entailed a good deal of ceremonial of a somewhat religious character. The Maori tatu, or *moko*, was of two kinds, of which the older method was a cutting into the skin with a small chisel-like tool made of sea-bird's wing-bones, shark's teeth, stones, or hard wood, and of different sizes and shapes. The edge of the chisel was applied to the skin and tapped by a small mallet, which sometimes had a broad flattened surface at one end used to wipe away the blood. This chiselling process was superseded by prick tatu, which was done with small-toothed or serrated implements dipped in colouring matter obtained either from charcoal mixed with oil or dog's fat or burnt and powdered resin.[4] In Borneo the design is pressed on to the skin with a tatu block dipped in pigment made from a mixture of soot and sugar-cane juice. The needle points of the pricker, which are also charged with pigment, are then driven into the skin by taps from a striker. Among the Kayans the men carve the designs on the blocks, but the tatu is done by women. The artists are under the protection of a tutelary spirit to whom sacrifices must be made, and the operator has to avoid certain foods. The women are tatued in a hut built for the purpose; their male relatives are dressed in bark-cloth and must remain indoors until the operation is completed; in fact it cannot be commenced unless their men-folk are at home. It is prohibited to tatu women at seed-time, or if a dead body lies unburied in the house, and bad dreams, such as 'a dream of floods, foretelling much blood-letting, will also interrupt the work.'[1] In Burma the outline of the desired pattern is roughly sketched on the skin with a camel's hair brush and is then pricked in by a series of punctures close together, which merge into a rough line. The pricker is of an unusual kind, being two feet long and weighted at the top with a brass or lead figure; the pigment is contained in a style four inches long, which fits into a hollow pipe and is thus joined to the weighted end.[2] In Japan steel needles of four different sizes are used; the effect of shading is procured by tying rows of needles together. Sepia, vermilion, and Prussian blue are used in the designs, which are very ornate.[3] In some parts of N. America the pigmented effect is obtained by running a needle-like implement through the skin threaded with some material coated in pigment.

This method was followed by the Salish tribes, who used a 'needle of fish-bone or a cactus spike, which passed a fine thread coated with charcoal under the skin,' or sometimes the charcoal was carried on an unthreaded needle, 'which was thrust under the skin in a horizontal direction.'[4]

The Eskimo use a needle and thread smeared with soot or gun-powder. Thus, speaking of the personal appearance of the Greenlanders, D. Crantz says:

'No one . . . is a finished beauty till the skin of her cheeks, chin, hands and feet, has been threaded by a string smeared with soot, which when drawn out leaves a black mark. The mother performs this painful operation on her daughter in childhood, fearful that she will else attract no husband. This custom obtains among the Indians of North America, and various Tartar tribes, where both sexes practise it; the one to heighten their charms, the other to inspire terror.'[5]

3. Patterns.—A detailed study of the patterns would doubtless yield results of considerable ethnological interest as pointing to the migrations and culture-contact of peoples. Flinders Petrie[6] has drawn attention to the resemblance between the Algerian patterns described by Lucien Jacquot[7] and those on the female figure found at Tukh and on the Libyans in the tomb of Seti I. (XIXth dynasty, 1300 B.C.). The dominating designs in Algeria are a cross and a figure resembling a fly, which are thought to be degenerate forms of the swastika—a device widely distributed in Africa and elsewhere, and of great antiquity, as is shown by its appearance on a leaden figure[8] in the second city of Troy (about 2500–2000 B.C.) and by its prevalence in ancient Crete. The designs in favour among the Haida tribes on the north-west coast of America are similar to those on their boats, house-fronts, pillars, and monuments, and include family crests and totemic symbols such as the thunder-bird, wolf, bear, codfish, and so on. There is a great variation in the patterns of the Polynesian tatu, for almost every island has some distinctive characteristic of its own. The Marquesans, *e.g.*, tatu in broad straight lines. Many of their signs suggest a hieroglyphic system which can be interpreted only by their priests; in Anaa, however, sea-urchins and quaint zoophytes are well represented on the leg and thigh. The Marquesan women have a design somewhat resembling a gridiron tatued on their lips.[9] In Tahiti the patterns are simpler, but of greater taste and elegance than those of the Marquesas Islands.

The coco-nut tree is a favourite object, and figures of men, animals, and flowers also occur, as well as stars, circles, and lozenges.[1] The Maori tatu stands out in striking contrast to that of the rest of Polynesia, its chief feature being the blending of spirals and sweeping curves, which follow the conformation of the human form, the face being generally completely covered. This prevalence of curved lines suggests Melanesian influence; for Polynesian tatu is generally rectilinear in character. Melanesian tatu is often asymmetrical, perhaps because it is done at different times and by different artists. Here again the patterns are very diverse and suggest, as regards some islands, Polynesian influence. Each of the three principal centres of tatu proper in New Guinea has peculiarities of design and execution; thus, curved lines prevail in Humboldt Bay instead of the broader stripes of the south coast, and in the central district the designs used in tatu resemble those on the pipes and gourds, which show a preponderance of straight lines over curves and an absence of human or animal forms. The Motu (Port Moresby) and kindred tribes are said to have a geometrical art, and their tatu is angular in character, but there seems to be good evidence that many of their designs were naturalistic in origin and became conventionalized later.[2] In the Admiralty Islands the men wear cicatrices on chest and shoulders in the form of circular spots of the size of half-a-crown. Tatu proper is mainly confined to the women, who have rings round the eyes and all over the face, and diagonal lines on the upper part of the front of the body crossing one another so as to form lozenge-shaped spaces.[3]

Complicated serial designs are worn by the women in Borneo. The fingers and feet are done at the age of ten, the forearm at eleven, the thighs partly at twelve, being finished at puberty; it is thought immodest to be tatued after motherhood. The men have isolated designs, such as the dog design, in elongated or rosette form—a device prominent in Kayan art and one that can be traced in the shoulder tatu of many of the tribes including the Barawans (Sarawak). The most primitive tatu in Borneo is that of the Uma Long women of Batang Kayan; it is stippled in—on the forearm only—in irregular dots. Indigenous patterns are done by freehand, no blocks being used for them. The thigh tatu in Borneo produces the effect of tight-fitting breeches, and resembles that found among the Burmese and some of the Naga tribes. The latter have an elaborate face tatu called *ak*, formed of continuous lines across the forehead, round and underneath the eyes, over the cheeks, to the corners of the mouth and the chin. 'Rows of spots follow the outside lines, and two fine lines mark out the nose in a large diamond space.' With the Nagas both sexes tatu, but some tribes do not mark the face, and have the tatu placed on the breast, shoulders, back, wrists, and thighs.[4] The Burmese tatu generally from the waist to the knees, but among the Shans it extends from the neck to the feet. The designs include mystic squares, triangles, and a great variety of animals. The old or jungle style was to cover the skin with tracery producing an indefinite effect; the new style is distinct in outline.[5] Perhaps the most highly developed tatu is that of the Japanese, who cover the body with fantastic figures of dragons, birds, flowers, and landscapes, in a manner that recalls the patterns on their silks.

4. Use and significance.—(*a*) *Magico-religious.*—The use and significance of these marks were manifold, and they have played an important part in the life of primitive man, since they had a magico-religious as well as a social aspect. Their widespread use, even at the present day, as a magical protection against sickness and other misfortunes shows a very general belief in their supernatural efficacy. The Yuin tribe of S.E. Australia wear vertical cicatrizations round the upper arm to make boomerangs glance off.[1] In Timorlaut scars are made with red-hot stones on the arms and shoulders in imitation of smallpox marks to ward off that disease.[2] The Andamanese believe that cicatrization is good for rheumatism, toothache, headache, paralysis, epilepsy, and phthisis; it is resorted to for these and other ailments when all else fails. The Todas use it to cure the pains caused by milking buffaloes. Tatu proper is a remedy for rheumatism much in favour with the men of the Halba caste, who work on the lands in the south of the Raipur District and the Kānker and Bastar States in India; its action is probably that of a counter-irritant.[3] The Gonds and Baigas have a number of designs for the protection of different parts of the body, including a figure of the monkey-god Hanuman to give strength, of Bhimsen's club to assist digestion, of the foot-god to cure pain, and so on.[4] The Burman has similar safeguards worn on all parts of the body; they are a protection against wounds and secure freedom from pain, and are sufficiently potent to procure even the favour of princes. The only tatu worn by the Burmese women is a love-charm in the form of a triangle between the eyes or on the lips or tongue; it is done with the 'drug of tenderness'—a mixture of vermilion with herbs and other ingredients such as the skin of trout-spotted lizards.[5] The Shans tatu boys as a test of courage, but special designs are added to prevent injuries or other mishaps. In Borneo the Kayan men wear a special tatu on the wrist called *lukut*, which keeps away illness. The *lukut* is a much-valued bead, which was formerly fastened on the wrist of the sick man to 'tie in' the soul; but, as the bead was liable to be lost, a tatued representation of it came to be worn instead. The Ainu women are tatued on the lips and arms to keep away the demons of disease, who are thus led to believe they are the wives of the gods, since these are all tatued in this manner. If an epidemic occurs in a village, the women must tatu each other; they also use tatuing as a remedy for failing eyesight.[6]

Many races believe that the efficacy of tatu marks extends beyond the present life to that of the next world, where they serve as marks of identification—*e.g.*, Nāgas of Manipur, Kayans of Borneo, N. American Indians, and many others—or as a guide, or as currency enabling the traveller to accomplish his journey.

The Dhanwār, who inhabit the wild hilly country adjoining Chotā Nāgpur, say that tatu marks 'remain on the soul after death, and that she shows them to God, probably for purposes of identification.'[7]

Women of the Brāhman caste believe that after death they will be able to sell the ornaments tatued on their bodies and to subsist on the proceeds. In Africa a similar belief is found among the Ekoi women, who think that in the next world they can exchange their scars for food, and that the ghost is able to remove them one by one for this

purpose.[1] The Eskimo and the Fijians believe in Elysium only for the tatued; the Fijian women who have not these marks are said to be served up as food for the gods. Some investigators have insisted upon a considerable religious element in tatu, since the operation is often accompanied by sacrifice, prayer, and other religious ceremonies, and the designs frequently represent sacred animals, or other objects that may be regarded as symbols of gods. These serve to express a close union between the god and his disciple; hence the need for certain tabus to avoid the dread consequences of contact with persons in this dangerous state. The priest of the Ewe-speaking people of W. Africa has special tatu marks indicating the deity whom he serves and the rank that he holds in the priestly order; the shoulder marks in this case are so sacred that they must not be touched by the laity.[2] In San Domingo the priests did not wear a distinctive dress, but had a figure of a *zemi* (idol) tatued or painted on their bodies.[3] Tatuing was regarded by many people as a sacred profession, and the artists were under the special protection of deities of the craft. In Tahiti these were the children of Taaroa, the principal deity; their images were kept in the temples of those who practised the art professionally, prayers being addressed to them by the operator before he began his work. The Tahitians say that tatuing originated among the gods, and there are legends in Samoa and elsewhere telling of its sacred origin.

(*b*) *Informatory.*—To people who do not possess a system of writing the wearing of permanent and distinctive body-marks is not merely an æsthetic advantage, but in many cases a real necessity. Used extensively by uncultured peoples, these marks became a convenient means of conveying to their fellow-men all kinds of information concerning their activities and environment. They serve as a record of achievement and a means of identifying a man's tribe, clan, totem, social status, age-grade, and so on; and they have been regarded by some authors as a primitive form of writing.[4] Thus, in Africa cicatrization is a common form of tribal mark, the scars being worn on the face or on other parts of the body and arranged in a certain pattern. The Shilluk, Dinka, Dahoman, Mxosa, Mtyopi, and Hausa tribes are among those who follow this practice. Scars are used for the same purpose in the Andaman Islands, and in Melville and Bathurst Islands of N. Australia. Ellis, writing of the Maoris of New Zealand, says that their faces were much tatued:

'Each chief had thus imprinted on his face the marks and involutions peculiar to his family or tribe; while the figures tatued on the faces of the dependants or retainers, though fewer in number, were the same in form as those by which the chief was distinguished.'[5]

Even individual Maoris could be identified by special marks which were tatued on the face—usually near the ear—in addition to the general pattern. These came to be used as the signature of the wearer and have been accepted as such on documents relating to transactions carried on between the Maoris and white men.

The Salish and Dené tribes of N. America have markings—generally on the breast—symbolic of the totem or *manitu* of the individual wearing them. The Haida Indians of Queen Charlotte Islands have their family totems or crests tatued on their bodies with great skill. The designs are often very elaborate and resemble those on the totem-posts that stand outside their houses. A. C. Haddon records an instance of the use of cicatrization to represent the totemic device in the Torres Straits, where he saw some women wearing it cut into their backs. He was told that the men wore it cut into the shoulder or calf of the leg.[1]

The Kavuya Indians of California formerly used the tatu designs worn by a landowner as a property mark by cutting or painting them upon trees and posts selected to indicate the boundaries. It was customary for the Maidu women to have a red spot tatued on the forehead by which, if taken prisoners in war, they could be identified by friends and so ransomed.[2]

A curious use of tatu occurs in the well-known story in Herodotus of the slave who was sent from Susa to Aristagoras of Miletus by Histiæus with instructions that he was to be shaved, and that Aristagoras should look at his head; this being done, it was found that a message had been tatued on the man's head, urging Aristagoras to revolt against the Persians.[3]

Cicatrization and tatu proper are included in the puberty rites and initiation ceremonies of many primitive peoples. In an account of one of these ceremonies in Australia Spencer and Gillen report:

'The final ceremony of initiation to manhood in the Urabunna tribe is called Wilyaru, and the same name is given to men who have passed through it. The most important part of the ceremony consists in making cuts on the back, one in the middle line of the neck and four or six others down each side of the backbone.'[4]

In the Marquesas Islands tatu proper was the principal initiatory rite.

In Samoa 'until a young man was tattooed, he was considered in his minority. He could not think of marriage, and he was constantly exposed to taunts and ridicule, as being poor and of low birth, and having no right to speak in the society of men. But as soon as he was tattooed he passed into his majority and considered himself entitled to the respect and privileges of mature years.'[5]

It sometimes marked the admission to secret societies, as in the Banks Islands (Melanesia), where at the performance of the *kole-kole* ceremonies the head of the *tamate* design adopted by members of the society is tatued on the wrist, a part of the body highly valued.[6] Mary H. Kingsley says of the initiation of boys in Africa:

'The boy, if he belongs to a tribe that goes in for tattooing, is tattooed, and handed over to instructors in the societies' secrets and formulæ.'[7]

In New Zealand tatuing began with both sexes at puberty, the women being tatued chiefly on the lips and chin.[8] Chin tatu on women signifies marriage, not only in New Zealand, but also among the Eskimo, the Chukchi, the Indians of the Pacific Coast, and in Syria, Egypt, and Tunis. Women are usually tatued at puberty. This is not, however, always the case, for in some of the islands of Fiji and among the Todas of the Nilghiris it is deferred until they have borne children, while with some races it is begun in infancy and completed at marriage. Only women are tatued among the Chukchi, most Californian tribes, the Ainus of Japan, and in many parts of India. In the Omaha tribe of N. America tatu marks on women signified great honour and a rank equal to that of a chief. Bachofen saw in the limitation of tatu to women among the Thracians an expression of their distinction and good social position.[9] This is contrary to the view taken by Plutarch, who said that the Thracians tatued their wives as a punishment to avenge the murder of Orpheus. Melanesia, where tatu is mainly confined to women, their social position is very inferior, whereas in Polynesia it is comparatively good, and they are seldom tatued. But it is questionable whether there is any necessary correlation between the tatuing of women and their position in the social scale. The limitation of tatu to one sex or the other may be due to other causes; *e.g.*, it is possible that in the South Seas it may be connected with the migrations of different peoples.[1]

The social rank and profession of men are often indicated by their tatu marks, as in the case of the Maori chief who wore a complicated face tatu, and the Creek Town king who was marked in blue with figures of the sun, moon, and stars, animals, landscapes, and even battle-scenes. It has already been noted that priests sometimes had distinctive tatu marks. In some parts of India they serve as an indication of caste. All Gowari men—a herdsman caste of the Marātha country—are tatued with a vertical line on the forehead, the possession of this mark securing admission to the caste feasts.

Among some Indians of Brazil the executioner, or *matador*, was scarified above the elbows by the chief of the clan 'so as to leave a permanent mark there; and this was the star and garter of their ambition, . . . the highest badge of honour. There were some who cut gashes in their breast, arms and thighs, on these occasions, and rubbed a black powder in, which left an indelible stain.'[2]

The wearing of tatu marks proved a convenient method of recording, among other things, great achievements demanding personal valour and skill. The Koita tribes of British New Guinea have a special tatu for homicides.[3] Those of the Baronga (Bantu) who have slain an enemy used to be decorated with special marks from one eyebrow to the other:

'Dreadful medicines were inoculated in the incisions and there remained pimples "which gave them the appearance of a buffalo when it frowns."'[4]

On the Mendalam river in Borneo, the Kayans reserve thigh tatu for head-taking braves. With the Western Eskimo the men are tatued as a sign of distinction. Those who have captured whales have marks to show this, so that their tatu becomes a kind of whale tally.[5]

In many countries it is not only a record of great events, but also a memorial of the dead. In the Saibai and Dauan Islands (Torres Straits) the women wear a shoulder scar for a brother's death; it represents his nose, and the longer the nose, the longer the scar.[6]

In New Zealand 'the women were the chief mourners at funerals. . . . The custom was, in days gone by, that they should gash their faces, neck, arms, and bodies with sharp shells until they streamed with blood; the *narahu* or moko-dye was sometimes applied to the wounds, and the stains commemorated the scenes at which the women assisted.'[7]

In Polynesia the tongue was tatued as a sign of mourning. Ellis saw this operation performed in a house where a number of chiefs had assembled for the purpose, and has described the tatuing of Queen Rihoriho's tongue after the death of her mother-in-law.

(c) *Decorative.*—Perhaps the most general use to which tatu has been put is that of personal adornment. Ellis, after noting that tatu was used in Polynesia as a badge of mourning and a kind of historical record, adds: 'But it was adopted by the greater number of people merely as a personal ornament; and tradition informs us that to this it owes its existence.'[8] Among the Kayans of Borneo, who have a very artistic style of tatu, the men affect it chiefly for ornament: so do the women in Greenland, New Zealand, and elsewhere. In fact both sexes in many parts of the world attach to it considerable æsthetic value. In regard to cicatrization among the Andamanese, Man says that it is primarily for ornament and secondarily to prove courage in enduring pain. It seems evident that in the Torres Straits islands it was adopted as a means of acquiring a certain accepted standard of beauty, for Haddon says that the women had a Λ-shaped scar to prevent the breasts from becoming too pendulous.[1] This fashion is also found on the neighbouring coasts of New Guinea and was observed by Seligman among the Otati, an Australian tribe on the east coast of Cape York.

In contrast with the opinions expressed in the writings of Waitz-Gerland[2] and others in reference to the religious significance of tatu, Joest and Westermarck see in it only an expression of man's vanity and love of adornment: 'At present tattooing is everywhere regarded exclusively, or almost exclusively, as a means of decoration, and Cook states expressly that, in the South Sea Islands, at the time of their discovery, it was in no way connected with religion.'[3] Westermarck admits, however, that it has been made to subserve many purposes, but adds: 'Nevertheless, it seems to be beyond doubt that men and women began to ornament, mutilate, paint, and tattoo themselves chiefly in order to make themselves attractive to the opposite sex,—that they might court successfully, or be courted.'[4] Wundt suggests that the marks at first gave magical protection against evil powers, but gradually became merely decorative, and were used to make the personality of the wearer more striking, as in the case of warriors, who wore them to increase their terrifying aspect.[5] On the other hand, E. Grosse thinks the priority should be given to the taste for embellishment, and that the marks only later came to have a tribal or social significance: 'Summarizing the results of our investigations of the significance of primitive scarification and tattooing, we find that the marks serve partly as tribal tokens and have perhaps as such sometimes a religious meaning, although this cannot be proved for a single instance. But in other and the largest number of cases the scars and tattoo marks are for ornament.'[6]

5. **Origin and development.**—Many theories have been put forward to account for the origin and development of the practice of thus marking the human body: as regards the origin, however, they must remain, for lack of evidence, little more than mere speculations. Instances have been known of involuntary tatu occurring among mechanics and other workmen, who have accidentally grazed or cut themselves while handling charcoal or other colouring matter. Primitive man may have arrived at the notion of tatu by accident, such as the pricking of a finger by a half-burnt splinter or thorn while kindling a fire. The unusual mark thus made might well excite his interest and so lead to an attempt at imitation and to elaboration and invention. Herbert Spencer thought that the practice arose from the custom of making blood-offerings to departed spirits, and that the marks thus made expressed subordination to or close union with them, and became in many instances tribal marks, 'as they would of course become if they were originally made when men bound themselves by blood to the dead founder of the tribe.'[7] In this connexion F. B. Jevons writes:

'The marks or scars left on legs or arms from which blood had been drawn were probably the origin of tattooing, as has occurred to various anthropologists. Like most other ideas, we may add, that of tattooing must have been forced on man; it was not his own invention, and, being a decorative idea, it must have followed the laws which regulate the development of all decorative art. . . . So the scars from ceremonial blood-letting may have suggested a figure; the resemblance was deliberately completed; and next time the scars were from the beginning designedly arranged to form a pattern.'[8]

M. Neuberger regards tatu as one of the popular customs that have sprung from primitive therapeutics: 'Smearing the skin with earth led to painting the body, and scarification of wounds and rubbing in the earth or rust (according to whether the pain was to be lessened or increased) developed into tattooing.'[1] Wundt, Joest, and others see a possible causal connexion between body-painting and tatuing and suggest that the latter was a crude attempt to fix the designs once painted on the body. Wundt regards both these practices as specific stages in primitive art; and in tatu he recognizes two types, the one being a crude system of simple marks often intensifying the natural lines of the body, and the other a stage in which the skin is treated as a material to work on—just as sand or rock is used for drawing upon—when the simpler marks are replaced by fantastic symbols. Capart points out the practical importance of replacing temporary marks by permanent ones, if they have a special meaning attached to them: 'Les dessins que le primitif se peint sur la peau n'ont aucun caractère de persistence et l'on peut à volonté les faire disparaître et les remplacer par d'autres. Il peut y avoir parfois intérêt à les rendre indélébiles, lorsqu'ils sont, par exemple, des marques de tribus ou des marques religieuses. De là naît la coutume de tatouage.'[2]

Concerning the origin of *moko*, or Maori tatu, native tradition says that the first settlers marked their faces for battle with charcoal, and later these warlike decorations were made permanent to save trouble. 'Hence arose the practice of carving the face and the body with dyed incisions.'[3]

How difficult and well-nigh impossible it is to arrive at an accurate knowledge of the early history of such a custom may be gathered from the admission of W. Ellis, who, after many years of personal contact with, and careful observation of, the natives of the Polynesian islands, said in reference to their tatu: 'Although practised by all classes I have not been able to trace its origin.'[4]

CONSTANCE JENKINSON.

TAUROBOLIUM.—The *taurobolium*, a sacrifice performed in connexion with the cult of the Great Mother of the Gods, but not limited to it, was one of the most peculiar and most celebrated rites of the last two centuries of paganism. A striking description of it is put by the Christian poet Prudentius, of the 4th cent., into the mouth of one of his characters, Romanus the Martyr (*Peristephanon*, x. 1006 ff.). The high priest of the Great Mother, a golden crown on his head, his temples richly bound with fillets, his toga worn *cinctu Gabino*, descends into a deep foss which is completely covered by a platform of planks pierced by a great number of fine holes. On to this platform is led a huge bull, bedecked with garlands of flowers, his front gleaming with gold. His breast is pierced by the consecrated spear, and the torrent of hot, steaming blood floods the covering of the trench, and rains through the thousand chinks and perforations on the expectant priest below, who throws back his head the better to present cheeks, ears, lips, nostrils, and even tongue and palate, to the purifying baptism. When life has fled and left cold the body of the slain bullock, and the flamens have removed it, the priest emerges and, with hair, beard, and vestments dripping with blood, presents himself to the expectant throng of worshippers, who salute and do obeisance to him as to one who has been purified.

There were two principal motives which prompted the ceremony of the *taurobolium*. In the earlier period, the 2nd and 3rd cent. A.D., it was usually a sacrifice whose object was the welfare of the Empire, Emperor, or community. An entire college, community, or even province could give it, and a frequent date for it was March 24, the *Dies Sanguinis* of the annual festival of the Mother and Attis. The more frequent motive of the rite in the late 3rd and 4th cent. was the purification and regeneration of an individual. Its efficacy lasted for twenty years, or was even eternal, the baptized person being spoken of as 'renatus in æternum' (*CIL* vi. 510, 512). It was performed by laymen as well as priests, and by persons of all ranks and both sexes. A special altar was erected for the occasion, the time occupied by the ceremony varied from one to five days, and the expense was borne by the individual or association that inaugurated it. Besides the personal and the patriotic motive, it was performed as a fulfilment of vows, or at the command of the Mother herself. In Rome it usually took place near a shrine which existed where the present church of St. Peter stands. The *criobolium*—the sacrifice of a ram—was instituted later in honour of Attis on the analogy of the *taurobolium*, in order to give him due prominence in the rites of the cult. See art. CRIOBOLIUM.

As the *taurobolium* was celebrated in honour of both the Great Mother and Attis, it probably possessed a significance regarding that part of the legend which concerned them both (see MOTHER OF THE GODS). The priest descends into the dark pit and leaves the light of day; Attis dies; the vegetation of the earth withers; the priest is bathed in blood, and rises from the pit purified; Attis is restored; the vegetation returns.

The similarity between Christian doctrine and the phrase *renatus in æternum* ('born again for eternity') is startling, and has suggested belief in some connexion between the two religions in the way of borrowing, especially as paganism vied with Christianity in later days in promising such benefits as the latter conferred. The *taurobolium*, however, is better explained as the survival of a primitive Oriental practice based upon the belief, not uncommon among rude peoples, that the strength of brute creation can be acquired by consumption of its actual substance or by contact with its blood. The spiritual meaning of the practice first came with the advance of culture and the discarding of the primitive, literal belief (see Cumont, *op. cit.* below).

Though the *taurobolium* might with reason be supposed to have come, with the cult of the Great Mother, from Asia Minor, there is no positive evidence that it was originally connected with it either in the East or in Italy. Cumont thinks that it was a rite in honour of the eastern Artemis Tauropolos, deriving from her its name *tauropolion*, which was corrupted to *taurobolium*; and that the rite, having become wide-spread in Cappadocia and the neighbouring provinces in connexion with the worship of Artemis Tauropolos and other deities closely allied or identified with her—principally Anaïtis and Bellona—naturally found its way with them into Italy early in the 2nd cent. A.D., after the annexation of that part of Asia to the Roman Empire, and was soon afterwards adopted and popularized by the priesthood of the Great Mother. Its first known celebration took place at Pozzuoli in A.D. 134, in honour of Venus Cælestis, who, Cumont thinks, was Anaïtis under a Roman name. His conclusion that it was celebrated in connexion with the worship of Bellona rests on slender evidence. Others believe it to have been a part of the Great Mother's worship in Asia Minor (Hepding, *op. cit.* below). Whatever its origin, its popularity was attained through the cult of the Great Mother.

GRANT SHOWERMAN.

TEETH.—1. Ornament and trophy.—Among both pre-historic and savage races teeth of animals and human beings are used as an ornament, usually strung together as a necklace, headband, or girdle. Such ornaments are already found among burial remains of Solutrean, Magdalenian, and Azilian horizons, the corpses having been buried wearing them. In a ceremonial burial of thirty-three skulls in the grotto at Ofnet, on the upper Danube, the skulls were ornamented with stag's teeth and shells.[1] Among savages the custom of wearing teeth is well-nigh universal,[2] and, while it may simply serve an ornamental purpose, the intention often goes farther. The teeth are worn as a trophy. Thus, among the tribes of the N.W. Amazon, necklaces are made of the teeth of the tiger and other animals, bored and threaded, or of human teeth bound into a necklace with fibre string. These denote the skill of the wearer as a hunter, or his bravery in war, and the human teeth, which are those of an enemy, are 'a visible and abiding token of completed revenge,' and are buried with the owner. Sometimes the larger animal teeth are ornamented with lines or carved.[3] Analogous to the practice of wearing teeth as a trophy is the curse used by savages, 'Let their teeth be broken,' and the Psalmist's words, 'Break their teeth' (58^6), 'Thou hast broken the teeth of the ungodly' (3^7). The suggestion is that of enemies as ferocious beasts deprived of their power to tear and rend.[4] Men doubtless used their teeth in early times as a weapon, as savage men and maniacs still do. Divine images are known to have actual teeth set in their mouths, possibly as a trophy or offering.[5]

Possibly teeth worn by men also served the purpose of an amulet, as having a connexion with the qualities of the animal or person from whom they were taken,[6] or as protecting the wearer from similar animals in time to come.[7] On the other hand, a person's own tooth might serve as an amulet. Pliny says that the first tooth shed by a child was so used and protected him from pain.[8] Where teeth are knocked out at initiation, they are sometimes carefully preserved, or regarded as sacred, or used for magical purposes.[9]

Teeth taken from a corpse were used to cure toothache or for magic, and those of an old woman were used as a fertility charm in the yam garden by the New Caledonians.[10]

2. Mutilation of the teeth.—Filing the teeth to a point either singly or in pairs, and knocking out certain teeth as a ceremonial act, usually at initiation, and the purposes which these practices serve, have been already discussed.[1]

Staining the teeth is practised by several lower tribes—*e.g.* in S. America and Indonesia—as well as at higher levels—*e.g.* in China (applying lac to the teeth).[2]

3. Teeth as relics.—Teeth of Christian saints have often formed relics, and in early Buddhism the four canine teeth of Gautama were among his 'seven great relics.' One of these has been famous in Ceylonese Buddhism as the *Dalada*. Its miraculous preservation from every means taken to destroy it by a hostile Indian king, and its ultimate arrival in Ceylon in A.D. 312, are the subjects of a long narrative, and the Chinese traveller Fa-hian describes the procession of the relic as he saw it in 405. At a later time the Portuguese are believed to have destroyed it, though the Ceylonese allege that they only destroyed a counterfeit and that the real tooth is the one still preserved at Kandy in a shrine. It is probably not genuine.[3]

4. Teeth in myth and legend.—Greek myth told how Kadmos, having slain the dragon guardian of the spring Areia, at the suggestion of Athene scattered its teeth on the earth like grain. From the teeth sprang armed men called Spartoi ('scattered') from the manner of their birth. A similar myth was told of Jason.[4]

In the 16th cent. a report that a child had been born with a golden tooth in Silesia caused much anxiety in Germany, being regarded as a portent. The physician Horst in 1595 published the result of his astrological researches on the subject, and declared that the tooth symbolized a golden age, preceded by the expulsion of the Turks from Christendom.[5]

TELEOLOGY.—I. *INTRODUCTORY*.—1. The term.—The word 'teleology' (Mod. Lat. *teleologia*, Germ. *Teleologie*, Fr. *téléologie*) appears to have been devised by Christian Wolff in 1728. He felt the need of a term to designate the branch of natural philosophy which had to do with ends (Aristotle's τέλος or οὗ ἕνεκα) or final causes (the *causa finalis* of the schoolmen) as distinguished from efficient causes (ἐξ οὗ γίγνεται, *causa efficiens*). For Wolff, accordingly, teleology signified the study of ends or final causes in nature, and more precisely the explanation or interpretation of natural phenomena in the light of the concept of end or final cause. In popularizing Leibniz's philosophy, he set explanation based on final cause side by side with explanation by efficient cause. Presumably Wolff derived teleology directly from τέλος, 'an end,' but, as J. Burnet has remarked,[6] the word is properly derived in the first instance from τέλειον, 'complete.' Thus, etymologically regarded, it does not bear the implication, which it has historically, of an external end; and the

prevalent 'organic' use of it in modern thought is justified.

2. The concept.—As already indicated, the concept is much older than the term. It attaches itself primarily to that organic view of nature which was developed in the ancient Greek philosophy as against the mechanical view. According to the mechanical view, the whole is the product of the parts by their mutual interaction. According to the organic doctrine, the whole is ideally prior to the parts and constitutes the explanation of their mechanical actions and reactions. This last was a doctrine influential not only in the sphere of natural philosophy but in the spheres of political and social philosophy as well, and it led to the teleological interpretation of nature as a realm of ends or final causes. As the whole was an unchangeable form, it gave to all movement a purpose and goal; and in the light of its purpose and goal the movement itself was most deeply interpreted. This ancient opposition between the mechanical and teleological standpoints, as represented by Democritus and Aristotle respectively, set a problem which runs through the whole history of philosophy. The fundamental question at issue is, Are natural processes subordinate to conscious rational purpose, or is the world to be explained and interpreted by mechanical principles alone? That is the deeper philosophical issue in its most clear-cut form. There is a narrower issue which has assumed increasing definiteness in modern times. The fundamental question here belongs to scientific method rather than to metaphysics, and is most prominent at the present time in the dispute between mechanism and teleology in biological theory. Are the characteristic problems of biology (*q.v.*) capable of solution by means of mechanistic categories, or must teleological factors also be postulated?

II. *HISTORICAL.*—**A. ANCIENT PERIOD.—1. Anaxagoras** (*c.* 500–428 B.C.) has been hailed as the father of teleology, but he is so only in a qualified sense.[1] His explanation of nature—to judge from the fragments of his Περὶ φύσεως preserved by Simplicius and from the references in Plato and Aristotle—appears to have been virtually a mechanical explanation on the basis of a qualitative atomism, nor is it even certain that his First Cause of motion was an immaterial or incorporeal essence. The movement and order of the universe he ascribes analogically to Νοῦς (mind, intelligence, reason), which by an initial impulse imparted a rotatory motion to the pre-existent chaos in which 'all things were together.' But, once the rotatory motion was set up, Νοῦς apparently had little else to do. It may be that a thoroughgoing teleological view of nature is logically involved in the Anaxagorean doctrine of Νοῦς, whether Νοῦς (which is represented as omniscient and omnipotent) be regarded as a spiritual or a corporeal essence, as mind or mind-stuff. On the other hand, it is altogether probable that Anaxagoras did not carry out the full implications of his doctrine. Socrates in the *Phædo*[2] complains that in actual explanations he called in only mechanical causes—'airs, æthers, waters, and such like absurdities'; and Aristotle in his *Metaphysics*[3] (in a passage reminiscent, as Burnet[4] allows, of the passage from the *Phædo*) charges him with making use of Νοῦς merely as a *deus ex machina*, to account for the formation of the cosmos or for phenomena that he could not explain on mechanical grounds. Similar objections, as J. Adam[5] reminds us, were afterwards urged against Descartes and Newton. But, however we may interpret the Anaxagorean concept, we cannot but recognize its significance in the history of thought.[1]

2. Diogenes of Apollonia.—The teaching of Anaxagoras was apparently influential upon his contemporary Diogenes, who attributes Νοῦς to his primary substance, air, inasmuch as all things are 'disposed in the best possible manner'—a phrase which sends one's mind on to Leibniz and his theological optimism. It is, however, impossible to say whether Diogenes followed up his affirmation of purpose or design in nature any farther than Anaxagoras appears to have done; and this difference between them remains, that, whereas with Anaxagoras the teleological inference is in the direction of theism, with Diogenes it is definitely pantheistic.[2]

3. Socrates.—The teleology of Socrates (*q.v.*) is to be found in the *Phædo* and the *Memorabilia*. (*a*) The Socrates of the *Phædo* expresses himself as mightily pleased with the book of Anaxagoras in which Νοῦς is affirmed to be the cause of all things, but as disappointed with the failure of Anaxagoras to transcend the mechanical view. He is dissatisfied with a philosophy that cannot show how everything finds itself as it is because it is best for it so to be. He has grasped the distinction between mechanical and final causes in nature, and discovers only in the latter a true ground of explanation. To rely upon mechanical causes alone would be as absurd as to say that the real reason or final cause of his sitting in prison was certain bodily dispositions, and not his mental resolve to abide by his sentence, as the best thing to do. Had this not seemed the best, then 'by the dog these muscles and bones would have been off to Megara or the Bœotian frontier long ago.'[3] (*b*) Consistently with this representation in the *Phædo* the Socrates of the *Memorabilia*[4] is found affirming an immanent Reason in the world, and consistently too with the general doctrine of the Platonic Socrates concerning the individual and the State (which Adam would sum up as 'noocracy,' or the supremacy of Νοῦς or Reason).[5] At the same time the Anaxagorean concept receives in the *Memorabilia* a development so one-sided that it becomes difficult, if on no other ground than this, to believe in the representations of Socrates in Plato and Xenophon respectively as both even essentially historical. W. Windelband[6] suspects the influence of Cynicism and Stoicism upon the representation in Xenophon. In any case it is an exclusively anthropocentric teleology that is here formulated. The whole world of nature is said to yield traces of design, as appears in particular from the wonderful adaptations of means to end in the structure of the human body, in man's psychical constitution, and in the phenomena of external nature; and, furthermore, all is designed towards the one end of the advantage and well-being of men. (*c*) The Socrates of the *Memorabilia* gave perhaps the first formal exposition of the 'argument from design.' Formally, and often naively, he argues from the evidences of design in nature to the existence of an intelligent and beneficent Deity (σοφοῦ τινὸς δημιουργοῦ καὶ φιλοῤῥόου).[7] This anthropocentric teleology, with the theistic inference associated with it, impressed itself strongly upon subsequent religious thought.

4. Plato.—(*a*) The teleology of Plato (*q.v.*) is so far indicated in what has been said regarding the Socrates of the *Phædo*, but it has a deeper philosophical setting than can actually be found in

Socrates. In keeping with his ethical and social philosophy, Plato seeks in his metaphysics to interpret the real in terms of the end or ideal of the Good. Ethics is for him the foundation of metaphysics, as it came to be for Lotze, and reality yields up its secrets according as its ethical meaning is apprehended. His conception, already adumbrated in the *Phædo*, of a 'Jacob's ladder of science' (as E. Caird calls it[1]), beginning with the lower principles of explanation and reaching to the highest principle of unity or the idea of the Good, by which all the others are explained, is developed more fully in the *Republic*.[2] The Good or Universal Reason (Νοῦς) is the final cause of every event and change, and to the idea of the Good all the other ideas are teleologically subordinate. The Good, as we may learn from a famous passage of the *Laws*,[3] is the perfection of the whole; and in the preservation and perfection of the whole every creature has its own proper end to fulfil. Thus it was that Plato sought by means of his theory of ideas to interpret the rational principle of Anaxagoras more adequately. He looks upon the world, says J. Hutchison Stirling, as 'a single teleological system with the Good alone as its heart.'[4]

(*b*) In applying his metaphysical principles to the interpretation of nature, Plato is hardly liable like the Socrates of the *Memorabilia* to the charges of externality and anthropocentrism. For the *Timæus*, in which such a teleology may be found, is, in its details at least, 'mythical.' In consistency with his theory of ideas, Plato could not have claimed more for his accounts of the phenomenal world than that they were 'likely tales' (εἰκότες λόγοι). In any case he does not, even in the *Timæus*, lay much stress upon particular instances of adaptation in nature, nor does he encourage the notion of adaptations as designed exclusively for human needs. (*c*) In the *Timæus*, as indeed in the *Philebus* in non-mythical form, a theological interpretation is offered of the teleological constitution of the world. In offering it, Plato would apparently overcome the dualism between the ideal and the phenomenal which is inherent in his theory of knowledge and reality. God, the Demiurge, is represented as bringing order and harmony out of the moving chaos of not-being (μὴ ὄν), in accordance with the pattern of the Good, and in so far as natural necessity (ἡ ἀνάγκη) allows. Thus natural necessity comes in when divine activity according to ends fails as a principle of explanation, and something is yielded to Democritus. But, while the teleological explanation involves a recognition of divine activity, and is so far on the lines of the theistic argument, the Demiurge of the *Timæus*—the self-moved mover who fashions the world—is not identified with the Good, nor is he to be equated with the God of modern theism.

5. Aristotle.—(*a*) While it may be allowed to Plato that no ultimate explanation of anything is possible apart from the discovery of its final cause, we have to turn to Aristotle (*q.v.*) for a more adequate recognition of mechanical causes as principles of explanation, and this although Aristotle is the protagonist of the organic and teleological view of the universe. In the endeavour to overcome the Platonic dualism of ideas and things, Aristotle gives an even more thoroughgoing interpretation of the Anaxagorean Νοῦς than is to be found in Plato. With Plato he believes in the real existence of the form or idea, but he cannot think of it as separate from the world. It exists in the world and in things. Reality is a process of development, in which the change from more imperfect to less imperfect being is to be interpreted in the light of the τέλος, which in things that are not eternal is the moving form or final state of actuality (ἐνεργεία). The moved matter, which is the primal state of potentiality (δύναμις), exists for the sake of the form.[5] The individual is both form and matter, being form in relation to what is lower in the scale of things, and matter in relation to what is higher. The marble is form in relation to the materials composing its substance, and matter in relation to the statue which is made from it. The tree is form in relation to the elements of the soil that enter into the process of its growth, and matter in relation to the house built of it. The Good is the highest form of all, being pure form without matter, and is the ultimate end or final cause of all existence and all movement. It is not actually generated in the world-process, but is eternally implied in it, as the goal of the creation.

(*b*) With this peculiar speculative idea of development which fills the central place in the *Metaphysics* Aristotle opposes Democritus (*q.v.*) and the atomists, who appeared to him as mere 'drunken stutterers' in comparison with Anaxagoras. Even in inorganic nature he finds purpose or final cause operative. Just as an army moving on the field, or a ship cleaving the sea under full sail, offers an instance of effort directed towards an end, so, wherever we observe in natural processes the regular achievement of results, we may similarly discern the presence of purpose. But it is principally the realm of organic nature that is viewed thus teleologically. How absurd, he urges, to ascribe the forms and activities of living beings to the operation merely of accident (τὸ αὐτόματον) or chance (ἡ τύχη)! Empedocles (*q.v.*) was emphatically wrong in his theory of the origin of species, in which he avers that nature produces in her prodigality every possible type of animal form, and that only those forms survive which are coherently and consistently constructed. If, as Empedocles believed, nature once produced 'man-faced cattle' (βουγενῆ ἀνδρόπρῳρα), presumably she also produced at one time or other 'olive-faced grapes'! Nature is a cause which acts purposively, and if her end is sometimes unattained, it is due to the mechanical necessity to which matter (ὕλη)—Plato's 'not-being'—is subject.

(*c*) Much more clearly than in Plato we find in Aristotle, especially in the *de Partibus Animalium* and other biological works, the recognition of the double play of mechanism and teleology in nature, especially in organic nature, which does not operate with the refractory medium of matter. As a naturalist he is content to lay stress upon only two forms of causation—material or mechanical (ἐξ ἀνάγκης) and formal or final (οὗ ἕνεκα), and the formal or final cause comes first, being the reason which determines the whole process. The mechanical causes are the servants and instruments of the final causes. Thus in Aristotle both mechanism and teleology are accepted as factors in the explanation of nature, though the Platonic principle preponderates. It is not quite true, however, to say that Aristotle has succeeded in reconciling Plato and Democritus, that by his cosmo-teleology he mediates between the onto-teleology of the theory of ideas and the mechanism associated with the atomistic hypothesis. Owing to his scientific limitations, notably in connexion with the mechanics of the heavens, Aristotle pushed explanation by final causes farther than his general principles warranted. Frequently resting upon final causes alone, he at once hindered the progress of his own scientific thought and lent his authority to the narrow and one-sided finalism of the scholastic interpretation.

(*d*) Aristotle's organic or teleological doctrine, based on the metaphysical concepts of matter and form, strikingly anticipates certain modern positions in biological and psychological science. Applied, *e.g.*, to the conception of the organism, it offers, as L. J. Henderson assures us,[1] a complete formulation of the biological principle of organization. Aristotle conceives of the living thing as an autonomous unit, having the teleological principle within, and with every part functionally related to every other and existing as the servant of the whole. That is the implication, we are told, of his comparison of the organism to a well-governed commonwealth, in which, once order is established, the individuals duly play their parts and a separate monarch is no more needed.

6. The Stoics.—(*a*) Among the so-called sects that came after Plato and Aristotle the Sceptics (*q.v.*) had no contribution to make in teleology. If causality was suspect with them, as with Hume in a later age, so also was finality. The contribution of the Epicureans (*q.v.*) was distinctly negative. Epicurus is to be classed with Leucippus and Democritus, of whom Aristotle said that they 'rejected design and referred all to necessity.'[2] But the Stoics (*q.v.*) recognize the principle of teleology. There was one philosopher indeed, an Aristotelian, who came near to Stoicism in his opposition to the mechanical explanations of the atomists; but, on the other hand, as Windelband puts it,[3] he 'threw away the keystone of the Aristotelian teleology.' This was Strato of Lampsacus, who denied the existence of pure form as of

pure matter, declaring form to be always immanent in matter, and so converting the Aristotelian system into a consistent naturalism. Stoicism may also be described as naturalism, but it was at the same time a pantheistic system. The old dualism of form and matter which Plato and Aristotle had inherited from Anaxagoras, and had failed to throw off, gave place to an eclectic and somewhat facile monism, in which one eternal substance manifested itself as spirit (λόγος σπερματικός) and matter (πνεῦμα διάπυρον). It was essentially a teleological explanation of the world that was given by Stoicism, because, although every particular phenomenon was said to be determined by natural necessity, as Democritus had maintained, natural necessity was not based, as with the atomists, on quantitative differences and initial movements, but depended on the vital activity of the whole.

(*b*) In carrying out its teleology, Stoicism made much of the beauty, order, and harmony of the world and the adaptations of means to end, especially in organic nature, as manifestations of the rational unity and ideal meaning of things. The evils of the world, which offered even more difficulty on the monistic hypothesis than in the Platonic and Aristotelian systems, were optimistically explained as instruments or concomitants of the great cosmic movement, and it was said that they would be recognized as such, if the individual could take the point of view of the whole. But the Stoic appeal to order and adaptation often descended to externality and anthropocentrism, as in the teaching attributed to Socrates in the *Memorabilia*. Thus it was said that the peacock was made for the sake of its beautiful tail, and the ass to carry man's burdens. Yet an immanent or intrinsic teleology such as is characteristic of Plato and Aristotle would have been altogether congruous with Stoic principles.

(*c*) If the *Memorabilia* is possibly influenced by Stoicism, Cicero's *de Natura Deorum* indubitably is. There the inference to God from the order and beauty of the universe is eloquently set forth in a well-known passage[1]—reminiscent perhaps of Plato's story of the Cave—attributed to Aristotle, where is depicted the impression that would be made on men whose dwellings had been underground, on their first beholding the glorious spectacle of earth and sea and sky. It has been suggested[2] that in the argument for the being of God contained in the *de Natura Deorum* it is Aristotle we have chiefly before us; *e.g.*, the comparison, in several passages, of the world to a furnished or inhabited house or an adorned and decorated temple of the gods (a comparison which is to be found also in writers like Philo the Jew and Minucius Felix the Christian apologist) is said to have come from Aristotle. This suggestion is odious to philosophers who are jealous for the purity of the Aristotelian doctrine of the end, especially as Cicero in the *de Natura Deorum* furnishes the prototype, in the ancient world, of Paley's *Natural Theology* and the Bridgewater Treatises.

7. Teleology of history.—While in the ancient Greek philosophy a teleology of nature was expounded, in the religious period of the ancient world and within the early Christian Church the idea of a teleology of history gained ground. The opposition in the Gnostic view of history to the OT religion as the revelation of an inferior Deity led to the view of history which has established itself as the truly Christian. It fastened upon the Pauline doctrine of the pædagogic function of the Law, which gave to the Law a distinctive place in a teleological series of divine processes; and the whole course of the ages was interpreted in the light of the great divine plan of redemption culminating in Jesus Christ. With Irenæus the teleology of nature is ancillary to the teleology of history as thus expounded from the Christian standpoint. At the hands of Augustine the whole conception receives an impressive treatment, and the human race is regarded as a teleological unity, as being destined to receive entrance into the catholic or universal Church (*civitas Dei*). This anthropocentric view of the world as the scene of the divine redemption in Jesus Christ still prevails in Christian theology, in which the teleological principle of history is sometimes described as Christological or Christocentric.

B. MEDIÆVAL PERIOD.—**Thomas Aquinas.**—All through the Middle Ages, in Christian and Muhammadan countries alike, the Aristotelian teleology dominated philosophical and scientific thought. Unfortunately it was the Aristotelian teleology in its defective form of explanation by final causes alone (*i.e.* apart from mechanical causes), and it laid an arrest upon the movement of natural philosophy. Yet Archimedes and others who came after Aristotle had shown that mechanics at any rate could altogether dispense with the hypothesis of final cause. Aquinas (*q.v.*) makes use of the so-called teleological proof, which was the favourite proof in the patristic and scholastic ages, and he quotes as exponents of it John of Damascus and Averroës on Aristotle's *Physics*. There is an intelligent 'somewhat,' says Aquinas, by which all natural objects are ordered in relation to an end, and this 'somewhat' we call God—which, indeed, is the gist of the teleological argument, whether in its popular or in its more philosophical form. Aquinas also catches up the patristic idea of the teleological unity of nature and history, and through his doctrine of the State gives it a more systematic expression. The State was not with him, as with Augustine, the devil's province (*civitas huius sæculi*), but was based on natural law or right (*lex naturalis*), which has its source in God; and the life of virtue, which Aristotle said was to be realized in the political society, was the preparation for the higher life of grace in the society or community of the Church. 'Gratia naturam non tollit sed perficit.'

C. MODERN PERIOD.—1. **Bruno.**—The transition from ancient and mediæval to modern thought is well illustrated, in this matter of teleology, as in others, in the views of Giordano Bruno (*q.v.*). His whole philosophy represents an attempt to combine in a unitary system the Platonic and Aristotelian idealism and the modern mechanical view of nature, of which Democritus was the precursor. Like the atomists, he affirmed that only, as it were, after repeated experiments on nature's part did combinations of elements arise which, as being adapted to ends, conserved their stability. At the same time he affirmed—and here the idealistic strain appears—that there is a world-soul, or inner principle of motion in nature, which is purposive in its working, and so orders all things as to secure the world's progress. Thus the mechanical and teleological views are united in this thinker.

2. **Bacon.**—Though Francis Bacon (*q.v.*) may also be said to belong to the age of transition, he was more definitely on the side of the modern scientific movement. It would appear that he looked upon the philosophies of Plato and Aristotle as 'planks of lighter and less solid wood' than the physical philosophies of ancient Greece lost in the wreckage of the Roman Empire. For him philosophy was restricted to the investigation of nature, and there were certain 'idols of the tribe,' or common prejudices, to be dismissed from the mind if nature was to be explained aright. Among these was interpretation by final causes. Under the illusion that man is the measure of things (which Protagorean utterance, curiously enough, is actually become the watchword of a recent philosophical movement) we interpret things in reference to ourselves (*ex analogia hominis*) instead of universally (*ex analogia universi*). Yet Bacon does not reject the reality of final causes.

'For the cause rendered, that the hairs about the eyelids are for the safeguard of the sight, doth not impugn the cause rendered, that pilosity is incident to orifices of moisture.' Final causes in physics are, however, sterile like Vestal virgins, and, worse than that, they are 'impertinent,' being indeed 'but remoras and hindrances to stay and slug the ship from further sailing.' But final causes have their place in metaphysic and religion. The divine wisdom even appears more admirable when nature 'intendeth' one thing and providence 'draweth forth' another.[1]

[1] Sik. ii.

[2] See Hutchison Stirling, *Philosophy and Theology*, p. 170 ff.

[1] *De Augmentis*, iii. 5.

Thus Bacon throws off the two thousand years' yoke and touches hands with Democritus and Leucippus across the centuries. But, while vindicating physical causation as the one form of causation of which physical science need take cognizance, he conserves the metaphysical and religious interests which were bound up with the Platonic and Aristotelian teleology. It were incredible to him that this 'universal frame' should be 'without a Mind.'[1] He failed, however, to appreciate the scientific importance of the Aristotelian concept of organization in biology, as also—but this was the legacy of the schools—the philosophical depth of the essential Aristotelian doctrine of the end.

3. Hobbes and Descartes.—(*a*) Hobbes (*q.v.*), following Bacon and Galileo, tried to liberate philosophy from the Platonic and Aristotelian ideas and forms and to substantiate the mechanical view not only in the realm of nature but in the realms also of mind and society. He reduced all cause to motion, and philosophy to a doctrine of motion.

(*b*) Though Descartes (*q.v.*) also dispensed with final causes in nature, he did not fall like Hobbes into materialism. He explained natural phenomena by the mechanical principles of matter and motion, so founding the now orthodox systematic view of mechanics, but he dissociated himself from the ultimate positions of the ancient atomistic philosophy. Mechanical explanation was not ultimate explanation. But his rejection of final causes in nature was on theological rather than epistemological grounds. We may legitimately enough, he thought, attribute ends or purposes to God, but we cannot hope to discover these, as they are hidden 'in the inscrutable abyss of His wisdom.' Here, as in Bacon, there is a clear distinction between the scientific and the metaphysical and religious interest in final causes—a distinction which became clear only in the modern period of thought.

(*c*) For the issue between mechanism and teleology in scientific explanation Descartes possesses considerable significance, not merely because of his peculiar vitalistic theory that the *vis viva* might alter the direction of motion if unable according to the law of conservation to change its quantity, but chiefly because of his law of conservation itself. In the effort to reach the true principle of mechanical causation, he arrived at the belief that God conserved in things as a whole all the movement which He introduced into them at the creation; so that in virtue of this initial disposition the necessary world-process was at every stage teleological. His vitalism was a short-lived theory, but his principle of conservation marks a notable advance in the teleology of nature.

4. Spinoza.—(*a*) The most vigorous, as it was the most uncompromising, attack upon final causes in nature came from Spinoza (*q.v.*). In explaining a particular phenomenon we cannot, he said, go beyond the particular attribute of the one divine substance, be it the attribute of thought or of extension, under which the phenomenon appears to us. For, while the attributes are parallel to each other, there is no interaction between them. Thus material phenomena, including the movements of the human body, are only explainable in physical terms. Matter cannot be grounded in mind. There can be no ends or purposes in nature.

(*b*) Apart from the incompatibility of the doctrine with his fundamental philosophy, two main objections are urged by Spinoza against final causes. The first is Bacon's objection—that acceptance of final causes hinders the investigation of nature: recourse to the will of God in the explanation of natural phenomena, and in particular of untoward phenomena like tempests, earthquakes, and diseases, is a refuge of ignorance (*asylum ignorantiæ*). The secrets of nature are with those who abandon final causes and place their trust in mathematics, which, as dealing with the essences and properties of things, leads to rational knowledge. The other objection is that the method of explanation by final causes encourages false anthropomorphic conceptions of God. A God who works purposively, or towards ends, is subject to fate or necessity and lacks perfection of being. It implies defect in God that He should be in need of anything. Nor have we any right to infer distinctions in the divine nature analogous to the elements of the human mind. The intellect and will we may ascribe to God are no more analogous to our intellects and wills than the constellation of the Dog to the animal that barks.

(*c*) Undoubtedly Spinoza did good service in exposing the weakness and superficiality of the traditional teleology, but it should be observed that, while the denial of teleology is already involved in the doctrines of substance and parallelism with which he sets out, at the close of his thought a certain light breaks in upon his system. The *amor intellectualis Dei* with which he concludes is part of the infinite love wherewith God loves Himself, and we may learn from it that with His universe God is well pleased. The ideas of satisfaction and value which are essential to a teleological interpretation of the universe appear to be here conserved.[1]

5. Leibniz.—(*a*) Despite the able efforts of the Cambridge Platonists (*q.v.*), such as Cudworth and More, to vindicate for final causes a place in physics, the mechanical view found increasing support, being applied also as against Platonists and vitalists to the phenomena of life, and it was left to Leibniz (*q.v.*) to attempt a reconciliation of the opposing principles. Leibniz's essential position still meets with great acceptance among scientists, philosophers, and theologians. In the phenomena of nature, he says, everything happens mechanically and at the same time metaphysically, and the source of the mechanical is the metaphysical. This position finds clear expression in two sayings that may be placed side by side—one from a recently discovered fragment, and the other quite familiar: 'Omnia in tota natura demonstrari possunt tum per causas finales, tum per causas efficientes.' 'Causae efficientes pendent a finalibus.'

(*b*) While Leibniz was as 'corpuscular' as Descartes or Spinoza in the explanation of particular phenomena, he could not, for two reasons, rest in the mechanical explanation. One reason appears in his metaphysical construction of the concept of substance. Rejecting the Cartesian and Spinozan opposition of extension and thought, and affirming substance to be force (*un être capable d'action*) and force substance, he passed from an abstract to a more concrete monism. Matter was no longer to be defined as extension but as a form of force, more specifically as power of resistance; and mind was no longer to be restricted to the sphere of consciousness, and was represented as comprising subconscious states (*petites perceptions*). With this view of substance, and with the aid of the Aristotelian principle of continuity and development, Leibniz at length reached the speculative position that the real world consists of an infinite host of independent monads or individuals, at countless different stages of development, whose activity is fundamentally spiritual or perceptual. Now it is the very nature of the monad to strive after the realization of all its latent possibilities. It has to rid itself of confused perceptions and attain true ideas, and so to enter into the mind of God the Supreme Monad—an end which may only be achieved on the plane of self-consciousness and spiritual freedom. So it is, according to Leibniz, that the forces active in mechanism may be interpreted from the standpoint of teleology. Everywhere in nature purposive activity may be discerned. Take but the inward view, or, rather, take but the universal view, and the world of physical causes and effects becomes a world of means and ends.

(*c*) The second reason that led Leibniz to uphold the teleological interpretation of the world starts from his postulate of 'pre-established harmony,' which is intimately connected with his monadology. Though independent or 'windowless,' each monad 'mirrors' the rest of the universe. Though subject to its own laws, each monad is in harmony with the universal development. Geulincx and Spinoza had already applied the principle of harmony or correspondence to the two Cartesian attributes, but Leibniz applies it to the totality of substance. He compares the correspondence which he has in view to different bands of musicians who may keep perfectly together without seeing or even hearing one another. He compares it also, using a frequent analogy of the time (and with the relation of body and mind chiefly in view), to two clocks so skilfully made as never to get out of time. The pre-established harmony is not imposed upon the world from without, but belongs to the inner life of the monads; none the less it needs to be explained. The only possible explanation is to be found in the will and purpose of God. It is God alone who brings to pass the union or interconnexion of substances whereby the world is orderly and rational. Thus the order of the world, interpreted as a pre-established harmony, necessitates the teleological inference to God.

(*d*) The principle involved in the teleological inference is named by Leibniz the principle of determinant or sufficient reason, viz. that nothing can exist or be true without a sufficient reason why it should be so and not otherwise. Without such a

principle, implying the complete rationality of existence, philosophy would for Leibniz have ceased to be, as indeed for Descartes or Spinoza. But Leibniz gave the principle a characteristic application. He regarded it as the foundation of the contingent truths of natural science, just as the principle of identity and contradiction was the foundation of the necessary truths of mathematics and logic. So that the conservation of force or energy and the equivalence of cause and effect in the world must be teleologically explained as dependent upon the divine wisdom and order.

(*c*) In biology, as in physics, Leibniz advanced the teleological problem. He is said to have established the truth that biological organization is compatible with the mechanistic theory, but in comparing the organism to a kind of 'divine machine' or 'natural automaton' he still comes short of the Aristotelian teleology.

6. **Rationalistic theism.**—(*a*) In the 18th cent. Leibniz's theology was more influential than his monadology. There appears to be a certain looseness of connexion between the two, and it was accentuated by Wolff's effort to systematize and popularize the master's doctrines. In Wolff the harmony of the world is no longer an immanent order, but an order externally imposed by God; and the world's chief end is utility and advantage for man and beast—especially utility for man. This externalism impressed itself upon the 'popular philosophy' that arose in Germany about the middle of the 18th cent., and it promoted a remarkable and many-sided growth of natural theology or teleological physics and organics, the aim of which was to multiply the evidences of design in nature in the interests of the teleological inference to creative wisdom and benevolence. There were astro-theologies, litho-theologies, phyto-theologies, insecto-theologies, ichthyotheologies, and numerous others. As among the Stoics, the ideas of advantage and utility were often beaten out into petty trivialities (*Nützlichkeitskrämerei*).

(*b*) In France Fénelon had already written eloquently on natural theology on similar lines, although later the materialism of d'Holbach and the scepticism of Bayle were to cut at the root of the popular teleology, and Voltaire was to pour contempt upon its anthropocentrism and shallow optimism.

(*c*) In England, too, natural theology was early developed on the lines of a superficial utilitarianism, beginning in the 17th cent. with the works of the naturalist Ray (on whom Milton drew in *Paradise Lost*), and of Boyle, Barrow, and Parker, continuing with Derham and many others through the 18th cent., and receiving classical exposition in Paley's *Natural Theology*.[1] So exhaustively had the teleology of nature been discussed that the Scottish divine Thomas Chalmers, in the first Bridgewater Treatise,[2] turned to mental as distinguished from physical teleology, discoursing on the adaptation of nature to mind and on adaptations within the mind; while McCosh[3] laid the emphasis upon moral teleology, inferring from the moral order a moral Governor.

(*d*) Notice should here be taken of a universal view of teleology held by the English deist Shaftesbury,[4] who rose above the particular views that so largely prevailed in the deistic as in the orthodox circles of his time. His was an æsthetic teleology, and in the beauty and perfection of the world he found a proof of the existence of God. Not only does the unity of the world point to a universal Spirit; but beauty lies not in matter but in form or formative power, which must work with design.

7. **Hume.**—(*a*) The speculative sincerity of David Hume (*q.v.*) was probably not so great as his speculative genius. In the *Treatise of Human Nature*[1] he reduced the world to a mere complex of sensations—not an ordered complex, which could be ascribed to a divine Author; and yet in his theological writings, notably in the *Dialogues concerning Natural Religion*,[2] we find him apparently assuming order and purposiveness in the universe. If the tendency of recent interpretations of the *Dialogues* is to be trusted, we may even regard Hume as sincerely adhering to what is there called a 'genuine theism,' and as accepting the essential core of the argument from design as its rational basis. We may hear Hume himself speaking through Cleanthes, the rationalistic theist, when it is maintained that at every turn we are obliged to have recourse to the hypothesis of design in the universe; or through Philo, who is sceptical and naturalistic in tendency, when he admits that all objections to the hypothesis of design appear mere 'cavils and sophisms' to those who realize the beauty and fitness of final causes.

(*b*) None the less the criticisms of the teleological inference which are put in the mouth of Philo are of great historical interest and importance. Cleanthes, who states the theistic argument from design (round which the discussion of natural religion mainly turns), compares the world of order to a great machine, subdivided into an infinite number of lesser machines, which, even in their most minute parts, are all adjusted to each other with marvellous accuracy. This universal adaptation of means to ends so resembles the products of human contrivance that we are led by all the rules of analogy to infer that the Author of nature is somewhat similar to the mind of man, though possessed of much larger faculties. Philo replies, in Hume's own sceptical vein, that the principle of analogy is not a sure basis of argument, especially as we depart the more from the similarity of the cases. Can we really speak, *e.g.*, of analogy between the fabric of a house and the generation of the universe? And why should thought, design, intelligence, be made the model of the whole? If it is valid to say that, because the world resembles a machine, it arose from design, is it not at least equally valid to say that, because the world resembles an animal, it arose from generation? And why go beyond nature in search of a transcendent cause? To take one step beyond the mundane system is to be forced to go on in an infinite progression. For the ideal world, into which the material world is traced, is itself to be traced into another ideal world, and so on. May it not be that there are forces in nature by means of which, even after a botching and bungling of many worlds throughout an eternity, this orderly and harmonious system was struck out? At most the argument from design can only prove the existence of a being in time and space, fashioning a given material, and all pretension to ascribe infinity to the Deity or even perfection in His finite capacity must be renounced. Can we even pretend to decide from the phenomena of nature as to whether the Deity is one or many? (A similar reference to the limitations of the argument is found in the *Enquiry concerning Human Understanding*,[3] in which the criticism is in the form adopted and made famous by Kant.)

(*c*) By the objections thus urged by Philo a strong impression is made upon Cleanthes, who is also led to admit, in view of the problem of evil, that the Deity might be described in the terms of 'benevolence, regulated by wisdom, and limited by necessity'—an old position of the Greek theology with which we have been familiarized in recent thought. The carefully formulated conclusion of the *Dialogues*, that (as Philo says) 'the cause or causes of order in the universe probably bear some remote analogy to human intelligence,' may not have represented in Hume's mind the whole of 'genuine theism,' but it dealt a destructive blow to the rationalistic theology of his time, with its deistic implications, its petty teleology, and its hedonistic view of life.

(*d*) On the scientific or philosophical side, however, Hume made a positive contribution to the problem of natural teleology. The idea goes back as far as Empedocles, and is expounded in Lucretius, that in nature the principle holds of the survival of the fit. In the *Dialogues*, as we have seen, Hume gives expression to this principle, and he does so in respect of both inorganic and organic nature. Described as the tendency towards equilibrium or equilibration, it is recognized in modern physics and biology as teleological in character; but, when Hume speaks of it further as perhaps originally contained in matter, he at least suggests the idea that there is a deeper and

more original teleology in nature than ordinary mechanistic theory suspects. So that with Hume the teleological appearance of nature is perhaps more than a postulate of the reflective or subjective judgment, as it is with Kant.

8. **Kant.**—(*a*) In his early work on *Universal Natural History and Theory of the Heavens*[1] Kant acknowledged the great value of the arguments drawn from the beauties, harmonies, and perfections of the universe, and more particularly of the starry heavens, to establish the existence of a supremely wise and powerful Creator. At the same time he rises above the popular teleology. In a later pre-critical work on *The Only Possible Proof of the Being of God*[2] he declares himself impressed with the physico-theological argument, but, like Hume's Philo, he doubts the validity of the inference to a Creator who is perfectly wise and good. In the *Critique of Pure Reason*[3] a similar criticism appears, with a famous tribute to the physico-theological argument as 'the oldest, the clearest, and that most in conformity with the common reason of humanity.'[4] The argument at the best, however, cannot take us beyond the great power and wisdom of the Author of the universe; and it can prove, not a Creator, but no more than an Architect, who is necessarily limited by the character of His material. Contingency belongs not to the matter but to the form of the world. The attempt to show that matter is contingent and dependent upon a principle of intelligence is to fall back upon the cosmological proof, which in its turn rests upon the ontological, with the consequence that the claim of the physico-theological to be a pure induction from experience is invalidated. This argument in fact originates in the propensity of the human mind to view the order and purposiveness of nature as though they were the products of intelligence and design—a propensity for which on the principles of the critical philosophy there can be no real basis.

(*b*) We need not dwell on Kant's views in his pre-critical writings of the teleological principle. It is sufficient to note that they were on the lines afterwards developed in the *Critiques*. In the *Critique of Pure Reason* he justifies, as against Hume's scepticism, the mechanical or scientific view of nature as subject to causal determination. In the *Critique of Practical Reason*[5] he vindicates the teleological view of the spiritual life as a realm of moral freedom and independence. From the critical standpoint therefore the doctrine of nature and the doctrine of morality may each be true in its own sphere, and mechanism and teleology be so far reconciled. In the *Critique of Judgment*[6] he seeks to overcome the dualism—in his own phrase, to bridge the gulf—between nature and the moral order, which he had regarded to begin with as closed systems, independent and separate. He realized that the sensible world of things and persons is but one aspect of reality, and the supersensible world of moral values but another, and that the two must be interrelated. Accordingly he draws attention to certain things belonging to the sensible world of nature which we cannot describe adequately without that notion of purpose or end which has its proper sphere in the supersensible world of spirit. One of these is the phenomenon of beauty, the other that of organic being.

(*c*) The first section of the *Critique* treats of the æsthetic judgment. In the æsthetic experience the beauty of nature, as of art, is felt to be purposive, in the sense that, while it arises out of the sensible, it is in harmony with our 'undefined idea' of the supersensible. The second section has to do with the teleological judgment, in which nature is regarded as purposive in itself, and not merely, as in the æsthetic judgment, in relation to the subject of experience.

(*d*) The purposive character of living beings raises for Kant anew the whole problem of the world as a teleological or organic system, and he now gives the notion of judgment a wider meaning than before. In its use of the principles of the understanding for the subsumption of the particular under the general (in which the faculty of judgment consists) judgment had been shown in the first *Critique* to be determinant or, as we might say, mechanical; *i.e.*, its function is to determine or specify the phenomenal world of experience as a mechanical system under inviolable principles. But judgment is also of another kind, viz. reflective. In subsuming the particular under the universal, reflective judgment makes use of the idea of subordination to purpose or end as the guide to its operations. The determinant judgment is analytical, and simply brings particular facts under the universal principles of the understanding. The reflective judgment is synthetical, and, operating with the idea of nature as a teleological or organic unity, discovers its specific laws. As Windelband[1] remarks, in this application of the category of the practical reason to the object of the theoretical, we have evidently the highest synthesis of the critical philosophy.

(*e*) But still there is no real transcendence of the dualism between the realms of nature and ends, between the factual world of experience and the ideal world of purpose and meaning. For the principle on which reflective judgment proceeds—that the form of nature implies purpose, that the specific laws of nature are to be regarded as though determined by purposive intelligence—is not constitutive of objects. Transcendental though it be, as involving an *a priori* synthetic judgment, it remains a subjective or regulative principle, serving as a rule or guide for the organization of experience and the further extension of knowledge. Yet without the conception of end or a purpose of reason, as realized in the form of organized beings, we could not make such beings intelligible to ourselves. Even a simple blade of grass is inexplicable unless we look upon it as purposive.

(*f*) The conception of the organism as purposive leads, moreover, to the view of collective nature as an organic whole or teleological unity. But it should be reiterated that we cannot affirm the principle of end or final cause as belonging to the essential constitution of nature. Could we penetrate to the hidden ground of nature, we should possibly discover that the principles of mechanical and teleological causation are assimilated in one single principle. The very limitation of our knowledge suggests to us the idea of a higher intelligence, possessed of knowledge which is direct and not mediated by a subjective principle. For such an intuitive or perceptive understanding there would be no such separation as our discursive understanding makes between means and end. As it is, the mechanical and teleological principles are at once complementary and heterogeneous, though the teleological is the final or inclusive principle.[2]

9. **Hegel.**—(*a*) In the course of his examination of the critical philosophy Hegel (*q.v.*) dealt with Kant's view of the physico-theological proof. He agrees with Kant as to its inadequacy as a rational or logical argument. The conception of design, like that of cause in the cosmological proof, cannot express the true nature of the relation of the world to God. At the same time the argument represents a further stage, the first stage being represented by the cosmological argument, in the process whereby in the hidden or implicit logic of religion thought reaches the full apprehension of God as spirit or self-conscious intelligence. Kant might have allowed this, but for the rigidity of the distinction he drew between the phenomenal and noumenal worlds, which made it impossible for thought to pass from the one to the other. But the distinction is only relative, and from the ultimate standpoint the two worlds are one. (*b*) As for the critique of the teleological judgment, here again Kant's doctrine is vitiated by the view of the phenomenal and the noumenal as abstract opposites. Yet Kant indicates, if indirectly, the right principle of cosmic interpretation. For it is impossible to distinguish the categories of mechanical and teleological causation as being constitutive and regulative, objective and subjective respectively. With his true apprehension of the idea of purpose as internal and immanent, Kant, but for his rationalistic prejudices, might have advanced to the recognition of the constitutive character of the organic or teleological principle. Internal

adaptation or design is no less constitutive than the principle of mechanical causation. To overcome, says Hegel, the opposition of phenomena and noumena, we must follow the development of the world from the realm of nature to the realm of mind and thence to the unity of nature and mind in the idea of God, in whom the world is seen to be a rational system.

10. Schelling: the philosophy of nature.—(*a*) If Kant promoted the movement of German idealism, he also promoted—perhaps indirectly rather than directly—the new German humanism. We shall take occasion later to speak of the teleological or organic view of history associated with the names of Schelling and Hegel, who carried forward the work of Bossuet and Montesquieu, of Herder (*q.v.*) and Lessing (*q.v.*). Meantime we refer to another aspect of the humanistic movement, viz. the teleological or organic view of nature which was upheld under the leadership of Schelling by the so-called philosophers of nature. For Schelling, as for Plato and others among the ancients, there was a world-soul which as an inner principle of life united all differences in nature in a single organic system. It was felt by the new humanists, as J. T. Merz[1] puts it, that in the Kantian and more particularly the Fichtean philosophy the details of the scenery of nature were forgotten in the interest of studying the attitude and the emotions of the beholder. (*b*) Under the shelter of the humanistic movement, it should be noticed, there was a recrudescence of vitalistic theories in biology (which term was first used in this period by Treviranus to cover the whole of the science of life). Though the biological implications of the *Critique of Judgment* are difficult to grasp, vitalism could readily appeal to Kant's philosophical authority against the mechanical theory of life. For, while Kant handed over the inorganic realm to the mechanical theory (in this only sanctioning a *fait accompli*), he had maintained along with the teleological unity of nature as a whole the Aristotelian concept of biological organization. So at least it was generally thought, despite the metaphysical distinction he drew between the determinant and the reflective or teleological judgment as constitutive and regulative respectively. It is a distinction indeed which science cannot but ignore. When science employs teleological concepts such as function or adaptation, it gives them the same validity as the concept of mechanical causation.[2]

11. Lotze.—(*a*) The humanistic movement soon lost its force. The vitalistic theories which had received their impulse from it, and which culminated in Johannes Müller, fell into comparative neglect, and the mechanical view of life was once more dominant. The most solid, according to H. Driesch,[3] of all the attacks upon the older vitalism was made by Lotze (*q.v.*), whom he describes as a static teleologist in physiology in that he believed in the irreducibility of the category of the organism, but a dynamic teleologist or vitalist in psychology in that he believed the soul to be productive of absolutely new mechanical movement. (*b*) But the significance of Lotze for teleology lies not so much in his work in the domain of biology as in his philosophical system. In him science and philosophy, which since Leibniz and Kant had been going separate ways, meet once more. For he combines the mechanical view of nature with a teleological metaphysics (which he holds Schelling also did). It is his aim to show, as he says in the Introduction to the *Microcosmus*, 'how absolutely universal is the extent and at the same time how completely subordinate the significance, of the mission which mechanism has to fulfil in the structure of the world.'[1] In his scientific materialism he was at one with the great body of the scientific thinkers of his age. In his speculative teleology he had affinities with Leibniz, Spinoza, Kant, and Herbart. Following Leibniz, he was led to conceive of the world as a plurality of real spiritual elements, but in mutual interaction according to the principle of immanent as distinguished from transeunt causality. In his endeavour to account for the causal relation and the reciprocal interaction of the elements, he was led, by a similar process of thought to that which Spinoza went through, to the idea of a universal all-embracing principle, which for religion has the value of God. Under the influence of Herbart and the Kantian criticism, he utilizes the principle of human analogy in interpreting the inner reality of nature, which he regards as the instrument of a purpose, viz. the purpose of supreme good, though it is by a practical conviction rather than a logical or rational process that we pass from the world of things and forms to the world of values. So it is that Lotze reaches his teleological interpretation of nature.

12. Darwin.—(*a*) At first sight it would appear that the theory of biological evolution associated with the name of Charles Darwin so strikingly vindicates the mechanical view of nature as to banish the idea of teleology altogether, not only from scientific explanation but also from philosophical interpretation. Certainly, as Darwin himself realized, the doctrine of descent by natural selection gave a fatal blow to the old argument from design as expounded by Paley.

'We can no longer argue,' he says, 'that the beautiful hinge of a bivalve shell must have been made by an intelligent being, like the hinge of a door by a man.'[2]

Paley had not appreciated the metaphysical difficulties involved in the notions of an external designer or contriver and of special external adaptations, and he laboured under the further limitation that he believed with the orthodox science of his time in the fixity or immutability of species. If species were not fixed and permanent forms but the results of long evolutionary processes determined by necessity or chance, then Paley's argument was still further discredited. There appeared to be no more design in the principle of natural selection than 'in the course which the wind blows.'[3]

(*b*) But, while the Darwinian theory was subversive of the teleological argument in its popular form, which was deistic or rationalistically theistic, it was not really anti-teleological in the Aristotelian and post-Kantian sense. No doubt the principle of natural selection is in itself fortuitous or non-teleological, and that despite the teleological flavour of the terms 'selection,' 'fitness,' by which it is expressed; so that J. Ward, borrowing a 'plain' term from Herbert Spencer, would describe the principle in mechanistic language as one of 'equilibration.'[4] Moreover, in the hands of ultra-Darwinians natural selection of random variations has been employed as an exclusive explanation of the modification and transformation of species, and, so employed, may be properly described as anti-teleological. But Darwin himself did not urge natural selection as an exclusive principle. He recognized in evolution other factors besides, both non-teleological and teleological; *e.g.*, in the last edition of the *Origin of Species* he makes a

point of saying that natural selection is 'aided in an important manner by the inherited effects of the use and disuse of parts.'[1] Ward contends that this, the Lamarckian factor, like the factors of sexual and human selection, is strictly teleological in the sense that it presupposes psychical activity, conscious or at least sentient, directed to the end of the satisfaction of needs or desires. Whether the Lamarckian is a real or suppositious factor in evolution is a point with which we are not here concerned. It might be added, however, that the anti-Darwinian theories of evolution are more favourable to the teleological idea than the Darwinian and ultra-Darwinian theories; also that Darwin's general theory of organic evolution, like the general cosmogonic theory of Kant and Laplace, is being increasingly recognized as not inconsistent with an ultimate teleology, profounder, subtler, and less rationalistic than Paley's.

'Unless the cosmos itself,' says Ward, 'is to be regarded as a finite and fortuitous variation persisting in an illimitable chaos, we must refer its orderliness and meaning to an indwelling, informing Life and Mind.'[2]

13. **Lachelier.** — In Merz's opinion Lachelier's short tract, *Du Fondement de l'induction*,[3] is 'a corner-stone in the edifice of modern thought.'[4] Lachelier faces the problem of the contingent (or the collocation of things in space) which, along with that of the discontinuous, is involved in the Lotzean formula, that 'the things which surround us are the material in which, the laws of nature the forms *through* which, the world of values, or the Ideals, are, or have to be, realized.'[5] Following Cournot, he took up into his philosophy the old distinction between nature passively conceived and nature hypostatized or taken actively (*natura naturata, natura naturans*). The possibility of inductive reasoning rests, he says, on the recognition of both these aspects of nature, which are complementary. From the one standpoint nature is a mechanical or serial unity in which the antecedent determines the consequent; from the other it is a teleological, systematic, or harmonious unity in which the whole determines the existence of the parts. Efficient causes and final causes are both needed in the inductive process. Nature is at once a science, for ever producing effects from causes, and an art, for ever setting about new inventions. As there is a principle of regularity in nature, so there is a principle also of harmony or order. The contrast of mechanism with teleology, as Bosanquet has put it, 'is rooted in the very nature of totality.'[6] We shall see that this philosophical position of Lachelier has been fruitful in the scientific investigation of the problem of universal teleology.

III. *Systematic.* — A. Teleology in empirical description.—1. **Description, explanation, interpretation.**—(*a*) In proceeding from the historical to the systematic discussion, it will make for convenience of treatment to distinguish three aspects of teleology. Historically they have been closely associated, and it is impossible to separate them in any rigid fashion. They may be named, however, the descriptive, the explanatory, and the interpretative. If one hesitates to set up the distinctions here implied, one hesitates more as to the terms by which to designate them. For description, explanation, and interpretation are ill-defined terms in current usage, although—perhaps because—they circulate so freely in discussions of the world and its meaning. By descriptive teleology we mean the teleology which answers at once to the definition of the concept of end or purpose and is immediately recognizable. It might be otherwise named as formal, empirical, or *de facto* teleology. By explanatory teleology we mean the teleology which is postulated in scientific theory in explanation of things, processes, and events. It might be otherwise named as methodical or logical teleology. By interpretative teleology we mean the teleology which offers in philosophy and religion a spiritual interpretation of the world as a whole. It might be otherwise named as speculative, ideal, or spiritual teleology.

(*b*) It might be objected in particular to this scheme that modern physical science leaves explanation to metaphysical philosophy and claims for its formulas no more than descriptive validity. It concerns itself only with the question, 'What is it?', and hands over to metaphysics and religious philosophy the questions, 'How came it to be?', and 'Why came it to be?' But it appears to us that physical science has been suffering in the last generation from an excess of reactionary modesty. Behind its so-called descriptive formulations, which are broad generalizations, lie worlds of patient observation and experiment and a host of flashing inspirations; and, if it does not tell us all about the 'How,' it tells us a great deal about it, and is richly entitled to the larger claim involved in the term 'explanation.'

'It is an interesting point,' remarks J. Arthur Thomson, 'that just about the time when physics began to proclaim emphatically that its office was to describe and not to explain, natural history in Darwin's hands passed emphatically from description to historical explanation.'[1]

For the rest, there is in any case august and already classical authority for a certain individualism in matters of terminology.[2]

2. **Descriptive teleology.**—(*a*) Teleology, in the sense of purposiveness or activity directed towards an end, is immediately recognizable in the ordinary work-a-day world. Conscious striving after ends, with adaptation of means to ends, is characteristic of human life. The concept of end or purpose is itself derived from observation of the human mind, and conative activity involving ends is central in human experience. But the idea of teleology is readily extended beyond the reference to consciousness. There is a teleology below consciousness, just as there is a teleology above consciousness.

'Neither Christianity nor the coral reef,' says Bosanquet, 'were ever any design of the men or the insects who constructed them; they lay altogether deeper in the roots of things.'[3]

(*b*) As in human history teleology or purposiveness appears to be present in the process, though the individual goes forth, like Abraham, not knowing whither he goes, so it is also in the spheres of subconscious and unconscious life. Many biological processes show the appearance at least of purposiveness, and Kant was right in saying that we could not attain to the knowledge of living things except under the form of the teleological judgment. The structure of the organism, the reciprocal relation of its parts as both means and ends for each other, and its growth, in which it is at once continually self-produced and self-producing, all appeared to him to demand a teleological explanation. It may be that, as Kant's critical philosophy forced him to admit, the teleological principle is subjective and only regulative of knowledge. All we have to say here is that the phenomena of organismal life have been explained both mechanistically and teleologically, but *prima facie* they are susceptible to description in teleological terms.

[2] Cf. C. C. J. Webb, *Studies in the History of Natural Theology*, Oxford, 1915, p. 6.
[3] *The Principle of Individuality and Value*, p. 158.

(*c*) When we pass from organic to inorganic nature, we meet no longer with the appearance of purposiveness, because in inorganic nature there are, to the eyes of sight at least, no individual beings. Yet, if we were to indulge the 'pathetic fallacy,' we should look even upon inorganic nature, the air, the sea, a rock, as responsive to our varying moods and thus as so far teleologically constituted.

(*d*) But, if purposiveness may not be discerned in the inorganic world, it is recognizable in products of art and man's device that are composed of inorganic elements. To our fancy a piece of machinery is often informed with life and purpose, like the machines in Samuel Butler's satire of *Erewhon*, but the purposiveness resides not in the parts but in the processes they subserve. A machine, as Driesch[1] says, is distinguished from other human 'artefacts' as being made for processes. It is, as it were, the depository of a purpose. That is why the comparison of the world to a machine in the old natural theology, as by Cleanthes in Hume's *Dialogues*, is apt enough, especially when the Deity is deistically conceived as purely transcendent. On the other hand, it is also the reason why the comparison is inept from the standpoint of materialism or naturalism, and why from such a standpoint mechanism as applied to the world is not a particularly happy term.

(*e*) Nor should it be forgotten that under descriptive teleology may be included the recognition of order, beauty, and adaptations in nature as a whole. These things are upon that empirical level of reality which has been attained by the unreflective processes of common sense, and are consequently appreciated by all; and they form the sufficient basis of the traditional argument from design. For order, beauty, adaptation, all speak the language of teleology.

3. The argument from design.—The argument classically expounded in the ancient world by the Stoic Lucilius Balbus in Cicero's *de Natura Deorum*, and in the modern world by Paley in his *Natural Theology*, is doubtless made more impressive, but is not essentially strengthened, by the multiplication of curious instances of extrinsic and intrinsic adaptation derived from the scientific order of nature. It is sufficiently based, as already said, on the fact of the empirical order. As an integral part, nay the very marrow and substance, of the old natural theology of Paley and the Bridgewater Treatises, the argument is liable to criticism for its deistic flavour, its hedonism, its antiquated pre-evolutionary science, its old-fashioned teleology; and apart from its limiting historical associations it is liable, as Hume and Kant made it abundantly clear, to the charge of being essentially fallacious. In inferring divine purposeful agency from the teleological appearance of nature, it is guilty, as the logicians would say, of the fallacy of transcendent inference. Obviously it must be restated in a profounder way, if it is to retain validity. The essence of the argument, says R. Flint,[2] is that order implies intelligence. It is an argument not *from* but *to* design, and it is only to be regarded as part of a great cumulative argument. G. T. Ladd[3] admits that the argument is properly an argument from universal order, and he is careful to say that it implies the validity of the ontological argument. From the 'orderly totality' of the universe he would postulate a world-ground conceived of as absolute will and intelligence. But the 'plain man,' with his eye only upon the empirical order, uses the argument without hesitation or logical scruple. When his mind beholds the chain of causes 'confederate and linked together, it must needs fly to Providence and Deity.'[1] Nor need the man of science, with his deeper appreciation of nature's order, be hesitant to follow the 'plain man.'

'The Logos,' says J. Arthur Thomson, 'is at the core of our system, implicit in the nebula, as now in the dewdrop. It slept for the most part through the evolution of plants and coral-like animals, whose dream-smiles are a joy for ever. It slept as the child sleeps before birth. It became more and more awake among higher animals,—feeling and knowing and willing. It became articulate in self-conscious Man,—and not least in his science.'[2]

'There is . . . something,' says D'Arcy W. Thompson, 'that is the order of the cosmos and the beauty of the world, that lives in all things living, and dwells in the mind and soul of man. . . . You may call it Entelechy, you may call it the Harmony of the World; you may call it the *Elan vital*, you may call it the Breath of Life. Or you may call it, as it is called in the Story-book of Creation, and in the hearts of men—you may call it the Spirit of God.'[3]

B. TELEOLOGY IN SCIENTIFIC EXPLANATION.—**1. Cosmology.**—(1) *Mechanical explanation.*—The teleological appearance of nature and the forms of life, considered above, has set a problem which science no more than philosophy can afford to ignore. In cosmology, however, narrowly interpreted as the science of inorganic nature, teleology is not required as a principle of explanation, whether the cosmos be considered in the spatial or in the temporal reference, *i.e.* from the standpoint of cosmography or from that of cosmogony. The inorganic world is not teleological, for physical science at least, in the sense of exhibiting immanent purposiveness. In its formulations of the things and processes of the inorganic world science employs only the mechanistic terms of kinematics, mechanics, physics, and chemistry; and it has amply vindicated its right to employ mechanistic terms exclusively in this sphere. Whether it may also do so in the spheres of biology, psychology, and sociology is another question. But in cosmology it has no use for the category of end or purpose, or for that matter for the categories of cause and substance, but assumes the working only of the non-spontaneous, the automatic, the mechanistic. It may possibly be that such real categories as substance and cause (whether efficient or final) are, in Mach's phrase, tinctured with 'fetishism,' but the exact sciences as such are by no means committed to a materialistic or naturalistic standpoint. Materialism and naturalism are ultimate positions, and scientific explanation is not necessarily that ultimate explanation which we would include under the term 'interpretation.' In point of fact, exact science increasingly recognizes the abstract and artificial quality of its explanations, as it realizes increasingly the distinction between conceptual formulation and perceptual reality. Its formulas have been variously characterized as symbols or counterfoils of reality, as a kind of conceptual shorthand, as economics of thought, as convenient hypothetical summations, or, in J. Royce's favourite metaphor, as the ledger entries and balances of a particular method of book-keeping. It is open to science, as he truly remarks, to enter its accounts by other methods of book-keeping.[4] Gravitation, *e.g.*, may yet be explained as a mere appearance of some more genuine process of nature.

(2) *Collocations.*—In view of the foregoing, we may allow that mechanical explanation, if abstract and hypothetical, reigns supreme and alone in the physical domain. While therefore Chalmers strengthened the case for physico-theology by reviving the Cartesian distinction between the

laws and the dispositions or collocations of matter, he placed his argument in jeopardy when he said that 'the main evidence for a Divinity lies, not in the laws of matter, but in the collocations.'[1] 'But what would become of this main evidence for a Divinity,' remarks J. Ward,[2] 'if the laws of matter themselves explained its collocations?' Yet, although science has been gathering the collocations within the mechanism of nature, the problem of order still remains. As in the biological sphere, so in the cosmological there is an ultimate collocation or configuration to be acknowledged which natural laws cannot explain. Says L. J. Henderson:

'The forms and states and quantities of matter and energy in the nebula determine the resulting solar system.'[3]

So that we may affirm that the universe possesses an original teleological character.

(3) *Fitness of the environment.*—(*a*) But is it possible to discover an explanation of the order of nature beyond the laws of nature's uniformity? Henderson thinks positive thought has found a clue. He points out that, if the scientific or mechanistic origin of the natural order is to be explained, it must be through principles that account not merely for the general character of orderliness in the phenomena of nature and the products of evolution, but also for that radical or fundamental diversity which Herbert Spencer declared necessary to the evolutionary process. Such principles, clearly, are to be sought not so much in the laws of nature as in the properties of matter. Accordingly Henderson has investigated the properties of the elements hydrogen, carbon, and oxygen, and of their compounds water and carbon dioxide, which have been the chief factors in both geological and organic evolution. These properties are found to constitute a unique group of singular physical and chemical characteristics, so that they are *maxima* or the fittest possible for organic life; *e.g.*—to take the compounds, which are the primary constituents of the environment—the solvent action of water is greater than the solvent action of any other liquid, and the solubility of carbon dioxide in water is such that it must always be evenly distributed between the atmosphere and aqueous liquids. Or—to take the elements themselves—hydrogen, carbon, and oxygen possess the greatest number of compounds and enter into the greatest number of reactions, involving the greatest transformations of energy known to the chemist. Further (and here a teleological consideration appears), the aforesaid unique ensemble of properties is uniquely favourable to the existence of systems—of which the world of physics and chemistry consists—of numerous, diverse, stable systems. In fitness for systems no other elements and compounds even approach hydrogen, carbon and oxygen, water and carbon dioxide. In short, the arrangement of the properties of matter among the elements makes the diversity of the evolutionary process possible.

(*b*) It is Henderson's opinion, following up these results of physico-chemical research, that, as according to the law of probabilities the connexion between the properties and the process cannot be due to mere contingency, the properties can only be regarded as a preparation for the process, or, in other words, as resembling adaptation. There must be a functional relationship between them—something like that known to physiology—which must be described as teleological. How otherwise can we express the fact that the collocation of properties unaccountably precedes that to which they are unquestionably related? Just as biological organization is teleological and non-mechanical, so with the connexion between the properties of hydrogen, carbon, and oxygen and the process of evolution. This is the positive contribution Henderson has to offer towards the vast problem of the contingent set for natural science by Lotze and Lachelier, and it goes to strengthen the philosophical position that mechanism and teleology are both at the foundation of the natural order.[4]

2. Biology.—(1) *Evolution.*—(*a*) The term 'evolution' (*q.v.*) is itself teleological in its primary meaning, and denotes more than mechanistic process; but it is possible that the mechanistic (*i.e.* physico-chemical) explanation of biological descent may be found sufficient in natural science. Possibly the evolutionary process is mechanistically determined through and through by natural selection interpreted as non-teleological (whether working upon so-called fortuitous variations or upon variations themselves subject to the law of probability), or by natural selection supplemented by other non-teleological factors, perhaps by some non-teleological factor yet to be discovered. On the other hand, we have seen that Darwin did not regard natural selection as exclusive of teleological factors, and it may well be that the psychical principles of self-conservation and subjective selection, on which J. Ward would lay stress, are required to give natural selection a *point d'appui.*[1]

(*b*) It is a searching test of the sufficiency of mechanistic explanation that H. Bergson in the rôle of biologist proposes. If it could be proved, he says, that life may manufacture the like apparatus, by unlike means, on divergent lines of evolution, then pure mechanism would be refutable and finality in a certain sense so far demonstrable. Accordingly he examines the evolutionary hypothesis in the two forms of it that have emerged from the welter of biological controversy since Darwin's time. He puts it to neo-Darwinism and neo-Lamarckism alike, What is the explanation of the structural analogy between the eye of a vertebrate and that of a mollusc like the common pecten?[2] It appears impossible on neo-Darwinian principles, which enter readily into a mechanistic philosophy of life, to account for the production of the same effect by two different accumulations of an enormous number of small causes, whether the possibility be urged, as by the stricter Darwinists, on the theory of insensible accidental variations or, as by de Vries, on the theory of sudden and simultaneous variations or, as by Eimer, on the theory that assigns a direct rather than an indirect influence to the environment, explaining the evolution of the various organs by a kind of mechanical composition of the external with the internal forces. To account for the convergence of effects we must appeal, continues Bergson, to some inner directing principle. Here Bergson's sympathy with the neo-vitalism of Driesch and Reinke appears, though he is more interested in their critical work than in their constructions. Turning to neo-Lamarckism, which explains variations not as accidental or determined but as springing from the effort of the living being to adapt itself to the environment, he declares it to be the only form of the later evolutionism capable of admitting, as it actually does with Cope, 'an internal and psychological principle of development.'[3] Weismann has shown, however, that the Lamarckian hereditary transmission of acquired characteristics is at most the exception and not the rule. How then may an organ such as the eye be developed? Is not the organic effort a deeper and more psychological thing than any neo-Lamarckian supposes? So Bergson returns to his speculative theory of life. He finds the fundamental cause of variations that accumulate and create new species, in the transmission of the *élan vital* from one generation of germs to the next through the developed organisms which bridge the interval between the generations. Life does not proceed by the association and addition of elements, which is the false anthropomorphic view both of mechanism and of finalism. Life proceeds by dissociation and division. It starts with a direction or tendency no doubt, and is in this sense finalistic, but we cannot foretell how and where it will end.

(2) *Mechanism and vitalism.*—(*a*) Leaving genetic considerations, we find ourselves still pursued by the mechanistic hypothesis, which affirms 'living matter' to be completely describable as a physico-chemical system, and organization and regulation—those distinguishing marks of living bodies—to be conceivable in physico-chemical terms. But it is also maintained as against this that the way of physico-chemical analysis and synthesis yields but an abstract product falling short of what answers to that *vue d'ensemble* which Comte advocated in the study of the living.

(*b*) Mechanistic theory in biology may be said to follow two main types, so far as regards the relation to teleology. Sometimes it has no traffic with teleology at all, and is still afflicted with what von Baer called 'teleophobia,' in its jealousy for the mechanical explanation. Sometimes again—and this represents the predominant tendency—it finds room for the teleological view, re-affirming in fact the Aristotelian doctrine of the internal teleology of the living thing, which is its self-regulation.

(*c*) But, with the more synthetic method involved in this type of mechanistic theory, vitalism has appeared once again in the history of biological theory, if in subtler and more elusive forms. The difference between the prevalent mechanistic theory and the vitalistic hypothesis may be expressed in the distinction due to Driesch between statical

and dynamical teleology.[1] Whereas in statical teleology the processes of life are judged to be purposive in virtue of a given machine-like order or form underlying them, in dynamical teleology it is in virtue of their possession of a peculiar autonomy; and dynamical teleology leads, as Driesch thinks, to some form of vitalism. We suppose L. J. Henderson, who is a mechanist, might then be also named a statical teleologist; for, while on the whole persuaded that organization (the central issue between the mechanism and vitalism of to-day) is capable of explanation—though not as yet explained—in physico-chemical terms, he is also persuaded that the teleological concept of organization, if to be found also in sociology and in the meteorological cycle, is a necessary biological category, and that a mechanistic physiology is at fault in not recognizing this.[2] But, though he thus believes with Driesch in teleology as an 'irreducible peculiarity' of vital phenomena, he is not a dynamical teleologist in the neo-vitalist sense. He might allow that organisms, like machines, are inert embodiments of purposiveness; he would not allow that they are actuated by purposiveness.

(*d*) The anti-mechanists also fall into two main groups. In the first are the neo-vitalists, of whom Driesch is the most prominent representative. They contend that biological processes are not properly explicable as physico-chemical processes within the living matter of the organism, but that some non-physical principle (like Driesch's entelechy or unifying causality) impresses itself upon those processes, to suspend, regulate, or control the physical and chemical reactions. With such a principle at work, the outcome of events, experimentally considered at least, is no longer determinate and unequivocal. Bergson's *élan vital* is such another non-perceptual determiner. Now, as Bergson realizes,[3] the contention of neo-vitalism is relevant and weighty on the critical side, but on its positive side is beset with difficulties. Even granted the existence of the mysterious non-mechanical semi-psychical entity postulated in the theory, it is impossible to say where and how it works in the biological processes. In recent constructions, no doubt, there is none of the crudity ridiculed by Molière in the older vitalism when he declared the cause of sleep to be the 'dormitive virtue' (which reminds one of the Johnsonian legend that the noise of wheels was once attributed by the learned doctor to the strepituosity of circumrotatory motion). All the same the conception of neo-vitalism remains mystical in quality, and biological science is reluctant to entertain it. An entity such as Driesch formulates, which is neither an energy nor a material substance but an agent *sui generis*, non-spatial, albeit acting into space, non-material, but logically belonging to nature, may have a strange fascination for the metaphysician, but will hardly retain a place for itself in the world of scientific explanation. We are assured, moreover, that the second law of thermo-dynamics, which entelechy is said to be capable of suspending, will hold even in the obscure cases in morphology on which Driesch founds his theory.[4] We are also assured that the non-physical something which is supposed to intervene in physical and chemical processes is invariably dependent upon the existence of physical and chemical conditions, yet it is not explained what part these conditions play in bringing about the actual results.[1] Vitalism sets itself a hard task indeed in seeking to steer between the Scylla and Charybdis of the mechanical and metaphysical explanations.[2]

(3) *Biologism.*—(*a*) Even as a scientific hypothesis neo-vitalism appears already on the way to occupy an intermediate position. The issue now seems to lie between some kind of mechanism and a form of teleological theory even more anti-mechanistic than neo-vitalism. For want of a better name, the theory may be called 'biologism.' It is the biological as distinguished from the mechanical theory of life. It is vitalistic in a sense, for it regards it as impossible to conceive distinctively biological phenomena in physical and chemical terms. For it the autonomy of life is more than a statical conception involving a teleological and non-mechanical relationship between mechanical things and processes. The autonomy of life is a dynamical conception, involving a dynamical teleology. But it is the living organism itself, and not some directive force within it, as in properly vitalistic theory, that is dominant in organic activity. The organism exists as such, and its structure and activities are the expression of its existence.

(*b*) Here, as is claimed by J. S. Haldane,[3] a protagonist of the biological theory of life, we have a good working hypothesis, necessary to biologists, and capable of overcoming the failures of the physico-chemical conception. Biology, he urges, is something very different from physico-chemistry applied to life. Its phenomena differ, not merely in complexity but also in kind, from physico-chemical phenomena. Although physico-chemistry has much to teach us concerning the origin and destiny of the material and energy in the body, it fails to throw light upon the apparently teleological ordering of that material and energy. The inadequacy of the physico-chemical explanation appears when we enter into the deeper problems of the organism's activity, not to say fundamental problems, such as reproduction and heredity. Animal heat, respiration, circulation—to take these examples from physiology—all contain teleological (*i.e.* physiological) elements that do not yield to physico-chemical analysis. Life is a unity of structure, environment, and activity, and is not resolvable into mechanism. Separate a living part from its environment, or suspend its activity, and you alter it completely. What therefore matter and energy are to physics, or the atom to chemistry, the living organism is to biology.

(*c*) Haldane is further of opinion that, inconsistent with each other as are the biological and ordinary physico-chemical theories of life (so that personally he would as soon go back to the mythology of his Saxon forefathers as to the mechanistic physiology), a common meeting-ground between biology and physico-chemistry will yet be discovered. That will mean, however, not a reduction of the organic to the inorganic, but the inclusion of the inorganic within the domain of biology.[4] In such an opinion the contrast between the principles of mechanism and biologism is sharply revealed, but with it we seem to be carried beyond the universe of discourse of natural science.

(*d*) It appears to us that in their bearing upon scientific explanation the differences between the mechanist or statical teleologist and the biologist or dynamical teleologist (if we may wrest Driesch's terms to our own use) is not so very radical after all. It is significant that Henderson accepts the mechanistic hypothesis as *upon the whole* most consistent with the evidence,[5] and that Haldane advocates the biological hypothesis on account of the unsatisfactoriness of the *ordinary* mechanistic (*i.e.* physico-chemical) explanation.[6] They both accept the principle of organic autonomy, and are good Aristotelians (as indeed Driesch is also), and possibly they would unite upon the formula: 'Not mechanism *or* vitalism, but mechanism *and* teleology.' This is a thesis admirably supported

by R. F. Alfred Hoernlé,[1] who would make the particular point that in biology teleology not only is compatible with mechanism but is 'logically dominant' over it. Teleological terms are required, he says, not as substitutes for physico-chemical terms but to express the dominancy of the structures and processes of life, which—as he goes on to say—cannot be reduced to exclusively physico-chemical terms without disregard of the difference, on which Bergson insists so strikingly, between the living and the dead.

(*c*) In an intimate and eloquent discussion of mechanism and vitalism J. Arthur Thomson[2] makes it abundantly clear that biologism is at present no more than a descriptive or methodological theory. It distinguishes itself from mechanism in demanding ultra-mechanical categories, but what these categories should be is not as yet determinate. He himself describes the organism in Bergsonian language as 'a historic being which has traded with time, and has enregistered within itself past experiences and experiments, and which has ever its conative bow bent towards the future.'[3] Hesitating to interpolate with Driesch and the positive vitalists a new agency or directive activity, he is content to say that the organism reveals new aspects of reality, transcending theoretically mechanical formulation.

3. Psychology.—(1) *Body and mind.*—(*a*) If the teleological standpoint is required in the scientific explanation of the world of organic nature, it is also required in respect of the world of mind or consciousness. The world of mind is the native sphere of purposive activity, and only a very abstract view of it can dispense with teleological categories. According to W. R. Sorley's[4] analysis, the contrast between a purely mechanical and a purposive system lies in this, that, although purpose is consistent with the law of causation and the principle of the conservation of energy, yet as the result of a purpose or mental idea there is a liberation of energy passing from the potential to the kinetic form, and the same purpose may also control, non-mechanically, the direction of the movement. Therefore it is not to account completely for the activity of a purposive system to describe it in merely mechanistic terms. When this position is challenged (as it is in psychology as well as in biology), as not fitting into the mechanistic hypothesis, the discussion passes inevitably into the speculative sphere.

(*b*) In psychology the mechanistic position founds upon the Cartesian law of psycho-physical parallelism, which represents the relation between brain-processes and psychical changes as one not of interaction but of concomitance, and it usually takes the form of the parallelistic hypothesis known as conscious automatism or psychical epiphenomenalism (*Begleiterscheinung*), in which inner or conscious states are accounted for as collateral products of the physical phenomena. On such principles as are embodied in this form of psycho-physical parallelism, the appearance of purpose or ideal direction is an illusion, and the consciousness of purpose either belongs to a different order or level of reality or is simply a result or effect, however vague, shadowy, impalpable, of the neural organization. On the first alternative, every neurosis has its psychosis, but they cannot affect each other. On the second alternative, every neurosis has its psychosis, but the neurosis cannot react even a very little upon the psychosis. Either, then, the mechanical theory does not apply to consciousness or the principle of the conservation of energy breaks down. The mechanist must either give up his case or overthrow the foundations of his faith. If this line of argument laid down by J. Ward[5] be valid, then we are free to turn from the mechanistic hypothesis to one that allows full value to the teleological appearance of conscious life, say, the animistic theory which has so long persisted in human thought and for which W. McDougall[6] has made out so strong a case in recent times, or the double-aspect theory with which the name of C. Lloyd Morgan[7] may be associated, and which J. Arthur Thomson favours as in line with his biological contention, largely based on a study of behaviour, that the organism is a psycho-physical unity.[8]

(2) *Psychologism.*—(*a*) But the working scientist need not commit himself to any speculative position on the problem of the relation between what we call body and what we call mind. If he is of opinion that psychology is more than physiology, as biology is more than physico-chemistry, he can at least affirm a descriptive or methodological 'psychologism,' transcending merely biological concepts and claiming teleological categories of its own, exclusive and irreducible. A merely physiological psychology, avers J. S. Haldane, is as inadequate as a mechanical physiology. A conscious organism, which reacts not only in space but also in time, and in its temporal reactions joins itself at once to the actual past and the potential future, shows itself to be more than a mere organism, such as we commonly regard a plant as being. The relation to its environment, which is established through perception and volition, is no mere external relation, as in the case of a mere organism. There is a real connexion between the external world and the internal organic world. The environment is 'teleologically determined' by our organic needs, and but for this 'teleological determinism' the world of our conscious experience would lack unity and coherence. To disregard therefore the psychological aspect of living things, especially human beings, and to describe their behaviour in other than psychological terms is to deal unduly in abstractions.[1]

(*b*) If we may extend a remark of J. Arthur Thomson,[2] in which this idea of the autonomy both of biology and of psychology is summed up, there is not one science of nature but several. There is the physical order of nature—the inorganic world—where mechanism is dominant (always on the assumption, as W. R. Sorley[3] reminds us, that qualitative differences are really reducible to quantitative differences of molecular and infra-molecular structure). There is the vital order of nature—the world of organisms—where mechanism is in logical subordination to teleology; and there is the psychical order of nature—the world of mind—where purpose is dominant. In biology the primacy of the biological standpoint, and in psychology the primacy of the psychological standpoint, is to be maintained.

(3) *Discontinuity.*—It may be thought that discontinuity of the categories makes against a unified theory of nature, such as mechanism offers. But a unified theory of nature does not require, says Hoernlé, 'the reduction of all universals to one kind, or the restriction of all variables to one type of values,' but may be achieved by 'the correlation of different types or groups or levels of phenomena.'[4] It is such a correlation, or cumulative integration, that is here supported. Nor need exception to it be taken in the name of ultimate or metaphysical unity. The categories of mechanism, life, and mind, which are fundamental hypotheses of natural science, are, in the wider view of philosophy, only provisional. It is possible, as J. S. Haldane has hinted, that the principle of continuity may yet be amply vindicated even in the scientific order of nature, and that without surrender to the mechanistic hypothesis. From his own standpoint of philosophical idealism he can say that the categories are the forms which the riches of the spiritual world assume in their progress towards the truly real.[5]

4. Sociology.—(1) *Two functions of psychology.*—A. E. Taylor[6] speaks of two functions of psychology. The first, which is not its proper function but which it exercises 'pending the majority of cerebral physiology,' is to set forth mental processes as mechanical uniformities of sequence. The other function is to treat of purposive activities and adjustments, and thereby to afford a suitable terminology for the sociological sciences, and in particular ethics and history. Apart from

the teleological symbols supplied by psychology, ethical appreciation and historical interpretation would be impossible. With this remark let us pass to the consideration of the teleological method in ethics and history.

(2) *Ethics.*—The teleological standpoint has its place in ethical theory, just as teleological symbolism necessarily enters into the appreciation of conduct. Among the possible divisions of ethical theories a fundamental one is into the teleological and the formal or jural. In the first case the moral standard is represented by the idea of good or value, in the second by that of duty or right. The teleological theory, which is found in Greek philosophy, takes the form either of hedonism or, as F. Paulsen,[1] borrowing an Aristotelian term, phrases it, of 'energism.' With Aristotle as with Plato the ethical end or ideal was the good personally realized in social relations as the actualization or full fruition of human powers and capacities. In modern ethical theory both the hedonistic and energistic forms of the teleological method have been revived. The formal or jural method is older than the other, as attaching itself to the legalistic stage of religion. Through Judaism it entered into theological ethics, and it received classical exposition at the hands of Kant, the fundamental idea of whose ethics is the original mental principle of the good will. As against a Kantian formalism and in favour of the teleological standpoint in ethical theory, it has often been urged that norms and motives of action are not abstract and transcendental principles but, as psychology and history teach us, generalized rules of the will which grow out of individual and social experience, and their value consists not in defining but in their power of promoting the ethical end.[2]

(3) *History.*—(*a*) The teleological principle has also been applied to the interpretation of the process of history. As we have already noticed, a teleological view of history took shape under the influence of Christianity, receiving various expression in Augustine and Thomas Aquinas. But it was not until Lessing and Herder, or rather not until Hegel, that history was reflectively and intimately treated in the light of the Aristotelian principles of continuity and development.

(*b*) We may distinguish in this connexion three types of historical theory. J. S. Mill recognized the principle of continuity, but in his 'inverse deductive' method he applied to historical development the atomizing, mechanizing principles of Democritus and Descartes, treating history as a kind of social dynamics, human motives and actions as causes and effects, and the course of events as a rigorously determined sequence. Against this view it may be maintained that the hypothesis of mechanical causation is irrelevant in the sphere of history and of sociology in general, as in the sphere of psychology in its most characteristic aspect. Psychical events are not duly appreciated by means of subpersonal categories. A similar criticism is applicable to Herbert Spencer's theory of history. Although Spencer, here following Comte, applies the idea of organic or super-organic evolution to the interpretation of the historical process, he never really breaks with the conviction—'fixed probably in his mind,' says J. T. Merz, 'through his engineering education'[3]—that change and progress in society, as in nature and mind, are explicable on mechanical principles.

(*c*) The second type of historical theory is represented by Hegel himself, for whom the course of events is a continuity, not of mechanical causation but of evolutionary development. It is still a rigidly determined movement, but it is teleologically conceived, the end dominating the process. 'As the germ carries within itself the whole nature of the tree, the flavour and the form of the fruits, so the first vestiges of mind virtually contain the whole history.'[4] The history of society is for Hegel the necessary evolution of the immanent Idea, and the process is fixed in all its stages. Through human interests and actions the final purpose of history is carried out, but the purpose itself—such is the absolute cunning of reason—is beyond and external to human interests and actions.[5]

(*d*) It may be objected to this organic view that, in so generalizing the conception of historical development, it does not bring out its true nature as a process of interaction between conscious and self-conscious minds. Nor does it appear to offer a true rationale of human progress. A better explanation of the historical process, in our judgment, is implied in the words of G. Galloway, who, following Siebeck, says: 'Progress is the spiritual vocation of humanity: it is a task which it sets to itself, not an inherent necessity of its constitution. The . . . ideal is freely pursued, and what ought to be is never that which perforce must be.'[1] In other words, the organic view is to be replaced by the historical or spiritual view, in which the freedom of human personality is more clearly acknowledged.[2]

(*e*) The fuller justification of such a position must lie in the metaphysical sphere. It may be here observed that the third type of historical theory might be distinguished from the others as teleological indeterminism. In it development is acknowledged to be epigenetic or, in Wundt's phrase, creatively synthetic, whereas in the teleological and mechanical determinisms above named development is the necessary effect, as it were, of an attraction from before or an impulsion from behind, of a *vis a fronte* or a *vis a tergo*.

(*f*) It may be also observed that teleological indeterminism in the theory of historical science naturally leads in metaphysics to a form of spiritual pluralism (*q.v.*), that teleological determinism makes a ready alliance with pantheism, and that mechanical determinism is at home in a naturalistic or positivistic setting. Yet it is not without significance that in J. S. Mill a survival of the deistic tendency of thought is to be found. For it may be not unjustly said that deism, as a dogmatic or theological position, with its shallow rationalizing of religion and its mechanical conception of the relation of God to the world, largely promoted what J. Royce calls the 'mechanistic dogma' of our time. An 'absentee God' may be done without, so long as the mechanism of the universe keeps going. At any rate naturalism, deism, pantheism, and pluralism will meet us as we pass from the world of scientific explanation into that of philosophical and religious interpretation.

C. TELEOLOGY IN SPIRITUAL INTERPRETATION. —1. **Universal teleology.**—As we view the world in its totality and seek to discover its meaning, we pass from empirical description and scientific or logical explanation to spiritual, *i.e.* philosophical and religious, interpretation. Here we are face to face with the metaphysical aspect of teleology, which is the aspect it has chiefly presented in history. The need of a philosophical interpretation of the world has always been more or less consciously realized, and in recent years there has been a renewal of interest in the deeper problems of nature, mind, and spirit. Philosophy and religion alike welcome the tendency among natural scientists to make incursions into what science has for long regarded as the 'foreign field' of metaphysics—a tendency begotten of the increasing recognition that no more than materialism does naturalism speak the last word on the perennial metaphysical problems. This has been largely due to 'the liberating influence of biology,'[3] and is marked among biologists. We have already noticed the idealistic position of J. S. Haldane, and Driesch has advanced beyond a conceptual phenomenalism, having even formulated a critical metaphysic which leans to theism.[4] The new and wider scientific outlook is well reflected in the significant postscript to T. C. Chamberlin's discussion of the geogonic, geological, and biological processes in his remarkable book, *The Origin of the Earth*:[5]

'It is our personal view that what we conveniently regard as merely material is at the same time spiritual, that what we try to reduce to the mechanistic is at the same time volitional; but whether this be so or not, the emergence of what we call the living from the inorganic and the emergence of what we call the psychic from the physiologic, were at once the transcendent and the transcendental features of the earth's evolution.'

2. Teleology and naturalism.—(*a*) It is the essence of naturalism to construe the phenomena of life, mind, and society in terms of the mechanical and non-teleological conceptions which serve in physical science. But we are persuaded that thus to reduce the world to a mechanism is to fail to account for large tracts of experience. Mechanism is an undeniably excellent methodical principle, but is inadequate as an ontological dogma. Moreover, with the mechanistic dogma teleology cannot live, *i.e.* teleology as philosophical interpretation. It has ever been the contention of teleologists from Aristotle onwards that meaning and purpose underlie all material and mechanical processes, that mind or spirit is ideally prior to matter and more fundamental to reality. Naturalism, it may be said, ignores the distinction implied in Lotze's remark that 'the machinery which produces the image of a phenomenon is not identical with the meaning of this image.'[1]

(*b*) The counter-contention of spiritual philosophy is to be justified on epistemological grounds, as by J. Ward in *Naturalism and Agnosticism*. Ward insists boldly with Kant that the intellect makes or fashions, though it does not create, nature. He shows that the fundamental principles of knowledge, unity, causality, and regularity have entered anthropomorphically into our conception of nature, and that nature itself as one and uniform is teleological, being found conformable to human intelligence and amenable to human ends. The result is that unity of nature and man in one rational and coherent scheme of things, that confronting of human reason by universal reason, in which idealism or spiritualism has always consisted. It is the fault of naturalism, as Pringle-Pattison expresses it, that it prematurely closes the record, that it substantiates the antecedents in abstraction from their consequents.

'There is no system,' as he says, 'no whole of being, no real fact at all, till the external gathers itself up, as it were, into internality, and existence sums itself up in the conscious soul.'[2]

3. The essence of teleological interpretation.—Teleological interpretation is then confessedly anthropomorphic, or, as F. C. S. Schiller would say, humanistic. It rests upon the general epistemological principle of analogy, and is itself a particular instance of it. According to the teleologist, the worlds of nature and history are to be interpreted after the analogy of the purposeful life of which man is conscious in himself. Since Hume and Kant, at any rate, the analogical character of the teleological principle has been widely recognized. We saw it in Lotze, who believed none the less that the category of end or purpose afforded a definite clue to the nature of ultimate reality. We may see it in Bergson, who, however, regards the category of end or purpose as applicable only to the lower scientific order of reality. Yet, as H. Höffding[3] points out, Bergson himself actually employs the principle of analogy along with that of intuition. With him intuition is only the first step towards the interpretation of reality. As mechanism proceeds by analogy in taking the organism to be a machine, and finalism in making it respond to a preconceived plan, so is it not to go by analogy to understand life as an *élan*, a thrust, an effort? But in this instance, it must be allowed, the analogy is drawn not as in finalism from the intelligent self-conscious life, but from the spontaneous and semi-conscious psychical life. While there is force in this criticism of Bergson's position, it does not follow that Bergson's philosophy of life is thereby discredited. All metaphysic, as Leibniz said, is founded on analogy. Apart from the analogy of human experience, no kind of knowledge would be possible, and it is entirely reasonable to proceed by way of that analogy to the consideration of the truly and ultimately real. But it may be urged, as against Bergson, that the analogy of purposeful self-conscious activity—so central a feature in human experience—offers a better clue to the nature of the absolute experience than does any analogy based on experience which is subpersonal. In any case what is claimed here is that teleology is a valid principle of interpretation, and that divine purpose may be recognized as a true cosmic principle. We shall see that, if divine purpose is actually so recognized, the *analogia hominis* must not be pressed in detail. The category of purpose or end, viewed from the side of the Absolute, requires to be delicately handled.

4. Pragmatic teleology. — Pragmatism (*q.v.*) claims to be different from other philosophies in respect of the clearness of its consciousness that teleology is no more than a methodological postulate. It is astounded at the misunderstanding revealed in the recent criticism[1] that it assumes a teleological constitution of the universe guaranteeing in mediæval fashion satisfaction to human desires and needs—an assumption out of keeping, the critic adds, with the spiritual pluralism or radical empiricism which pragmatism generally professes. In reply F. C. S. Schiller[2] insists that, while the pragmatist makes use of the teleological principle, it is not for him an *a priori* truth that the universe is going to prove good and to be found favourable to his desires. His is a heuristic teleology. He assumes commensurability between the supreme reality and human faculty, and then acts upon the assumption in hope. In contrast to this methodological optimism, one recalls the attitude of Bertrand Russell,[3] who repudiates the 'will to believe' as an argument and can only face the universe with 'unyielding despair.' For, according to his naturalistic view, the universe is blind to good and evil and indifferent to human interests. Perhaps, as C. A. Richardson[4] suggests, it is the preoccupation of logical pluralism with the objective side of experience that leads it to look upon the notion of teleology with doubt and suspicion. But more likely the attitude arises out of a personal conviction or resolution of character.

5. Teleology in personal idealism.—(*a*) Where personal idealism means spiritual pluralism of a theistic type, the concept of purpose applied to the interpretation of the universe yields a conclusion that satisfies. Consider first how thoroughgoing an application of this concept is embodied in personal idealism. It conceives reality, as in the monadisms of Leibniz and Lotze, as consisting of a plurality of experiencing subjects or spiritual centres of experience. In this it builds upon the analogy in respect of purposiveness between human persons and the lower forms of organic life, and upon the conjecture that even inorganic matter is composed of purposive individuals. Like organic species arrested in their evolution, or apparently so, these exhibit the minimum of spontaneity and the maximum of habit, according to the idea expressed by J. Ward, 'Routine presupposes antecedent living purpose.'[5] The essential nature of the monads or spiritual individuals is affirmed to be their self-activity, involving self-determination (conscious, subconscious, or unconscious) in

reference to ends. Thus spirit and spontaneity, which naturalism banishes from the world, are restored on this panpsychist hypothesis throughout the whole vast range of experience. But that coherent experience may be made possible, a sympathetic *rapport* or responsive sympathy is, as with Lotze, postulated among the monads.

(*b*) With this the theory of personal idealism advances from its pluralistic base to its final theistic position, in which the world-ground is also teleologically conceived. Sympathetic *rapport* implies unity in the plurality, and unity implies a unifying principle, and the unifying principle is best stated not in the abstract terms characteristic of absolutist systems but in terms of that conative unity, that striving after the realization of ends, which is given at once in the most simple and the most complex individual experience; and in terms, moreover, of conscious and self-conscious activity, according to the teleological principle of the interpretation of the lower by the higher. Further, if we describe the world-ground as an ultimate self-conscious will, we are not to think of it, as in absolute idealism, as a purely immanent principle. Though God gives unity or system to the plurality of monads, He is not Himself the unity in which they subsist. There is a principle of distinction in a self-conscious mind, in virtue of which it belongs to itself and does not merely enter into other selves. So it is that G. Galloway,[1] *e.g.*, presses to a theistic conclusion.

(*c*) The map of reality consists, according to this theistic argument, of simple monads interacting within a common medium or environment, which is grounded in a transcendent self-conscious will. It is claimed that the theory offers a better key to the understanding of unity and individuality than absolute idealism or natural realism can supply. It is a brave attempt at any rate (and this is our particular point) to justify the teleological view of the universe on metaphysical grounds. Whether it yields too much to the voluntaristic psychology we do not pretend to judge; but we appreciate its consistency with the theism of the moral and religious consciousness, in which the teleological character of the world is felt.

'At the heart of religion and morality,' says Siebeck, 'is the feeling that the existence and development of the world is not an indifferent matter, but is designed to realise a highest Good.'[2]

When therefore ethical theism, with its religious conception of God as the absolutely good, is set beside the metaphysical theism of the pluralistic approach to reality, it seems possible to state a conclusion in terms such as these. (1) In the language of philosophy: though individual existences and personal spirits have a being for themselves and are variously endowed with spontaneity, the development of experience remains in the control of the world-ground. (2) In the language of theology: though the actions of the creature are not absolutely foreordained or predestinated but manifest spontaneity and freedom in various degrees, they fall within the providential government of God. (3) In the language both of philosophy and of theology, and in Galloway's concluding words, if the world have its ground in a self-conscious and ethical will, which comprehends and sustains all the individual centres of experience, faith in a providential order of things is sufficiently justified.[3]

6. Teleology of deism.—(*a*) While it may be said from the humanist side that the development of the universe is towards the goal of spiritual personality, it is difficult to conceive of the world-process *sub specie æternitatis*. The deistic conception of it, however, is an easy target for criticism. Its view of the world has been described as 'neter-otelic.' The world is regarded as a sphere of divine purpose, but divine purpose is as it were imposed upon it from without. There is an inherent dualism in this, as J. S. Mill realized.

(*b*) In the traditional form of the 'argument from design,' where the setting is deistic, the divine Artificer fashioned the world to its present form out of an already given matter; or else, as in the ecclesiastical doctrine, the matter was first created out of nothing by divine power, then shaped by divine wisdom and beneficence. But this initial dissociation of matter and form is inconceivable, and has been 'as much a bugbear as a chimæra.'[1] The idea of external adaptation should be replaced by that of internal or immanent purpose. God is not beyond or even alongside His world, says a truer theism; He is within it as immanent life, will, intelligence.

(*c*) In the sphere of history, as in the sphere of nature, the deistic teleology is also superficial and inadequate. Its language, if not inappropriate in the world of concrete relationships in which religion lives and moves, can hardly be literally applied in philosophy. It looks upon God as a moral governor who imposes His laws upon man after the fashion of an earthly potentate. But, says a truer theism again, the divine laws are not externally imposed, but are immanent in man's heart and conscience; and the divine providence is not exercised *ab extra*, but is an immanent righteousness working in and through free human agency.

(*d*) May we not say that the end or purpose of God in nature and history is His self-manifestation or self-communication to personal self-conscious individuals capable of a spiritual response to Him whereby His own life receives enrichment? But, even in so saying, we speak in the manner of men in terms of time rather than eternity.

7. The purgation of purpose.—(*a*) With the deepening of its philosophical interpretation, the teleology of theism loses undoubtedly much of its traditional and popular meaning, but a substantial meaning may remain. The finite element of contrivance, with external adaptation of means to end, may rightly fall away from the idea of purpose as applied to the nature of the infinite experience. No part of the world is then in danger of being handed over, as virtually in deistic theology, to mechanical necessity; and the inorganic becomes essentially related or adapted to the organic, and both inorganic and organic to the whole cosmic process. It is the strength of idealistic interpretation that it can thus dispense in the cosmic reference with the 'theistic Demiurge'[2] and associate itself with what has been called an 'autotelic' view of the world-process. When purpose is no longer thought of as superinduced in creation and providence upon particular events of the world, but is intimately applied to the world in its totality, we learn to appreciate Kant's ideal of nature as a complete teleological system, in which for the intuitive or perceptive understanding the distinction of means and end is transcended, and the whole appears as the unity of its members and the members as the differentiation of the whole.[3]

(*b*) If the notions of contrivance and external adaptation are to be dismissed as unduly anthropomorphic, is the notion of a preconceived plan to be retained, or is the so-called plan but the nature or process of the whole? It would be easier for the personal idealist or theistic pluralist to retain the notion than for the absolutist. It was the

conviction that God cannot be regarded, except by the logical imagination, as devising schemes and selecting methods that led Spinoza, from his standpoint of abstract monism or singularism, to repudiate the principle of human analogy altogether and to deny of God the faculties of intellect and will. These, as being exercised in the outcarrying of finite plans and purposes, could not be predicated of the eternal Being. There is danger as well as truth in such a position, but what we are here concerned to say is that Spinoza's views are not incompatible with the essential idea of teleology. He denounces externalism and anthropocentrism, but none the less he looks upon the world as a significant whole, necessitated indeed, but necessitated by the divine nature itself, which is the nature of the whole.

'It is the idea,' says Pringle-Pattison, 'of the divine necessity as a self-affirmed life, and not as a blind force acting within the universe like a fate which it undergoes, that constitutes the differentia between a theistic and a non-theistic doctrine.'[1]

(*c*) In support of Spinoza's objection to the notion of a pre-existent cosmic plan, it is pointed out that the conception of purpose therein involved is even inapplicable to human action of the highest kind, such as moral conduct or artistic production. We may therefore grant it to A. D. Lindsay,[2] a sympathetic interpreter of Bergson, that, if the world is a purposive system, it possesses a unity or individuality in time as well as in space. Apparently such a consideration lies behind Bergson's rejection of radical finalism—such as Leibniz's—as being only an inverted mechanism, as implying that things and beings realize a programme previously arranged ('*Tout est donné*'). To postulate the totality of the real as thus complete in the beginning is to make time (*q.v.*) of no account. If time *does* nothing, it *is* nothing. Yet, according to Bergson, time—not abstract spatialized time but concrete time or real duration (*la durée*)—is the very substance of our world, and there is no stuff more substantial or more resistant.

(*d*) The force of what Bergson here essentially contends for is acknowledged by idealistic thinkers. If the course of the world is preformed and predetermined—'the dull rattling off of a chain that was forged innumerable ages ago'[3] — there is indeed not much to choose between naturalism and idealism. In this connexion it is significant that naturalism and idealism, like fatalism and predestinarianism, often meet and, like righteousness and peace, kiss each other. It is also significant that the crusade of spiritual pluralism, in its various forms, against the absolutist systems is for the redemption of the spiritual values sold by them—'treacherously sold,' says F. C. S. Schiller[4]—into the bondage of naturalism. If then we abandon radical finalism with its illusion of preformation and predeterminism, shall we say that 'the history of the universe is the history of a great adventure'? So C. F. D'Arcy[5] puts it, in sympathy with the Bergsonian view.

(*e*) Where idealism differs from Bergsonism, if not from Bergson himself, is in holding that the adventure is not in the experience of the absolute but in the experience or from the standpoint of the finite subject. Moreover, for a theistic idealism there are bounds to the scope of the adventure. The theistic universe is fundamentally ethical. It is the very heart and core of theistic faith that an eternal purpose of good is working itself out in the world. In terms of modern Christian theology, the world is the scene of the progressive realization of the Kingdom of God.

(*f*) It is but to state the complementary side of this faith to affirm that the world must possess value and real existence for the divine experience, and that into the divine experience the time-process must enter somehow. The purpose which God possesses in Himself is independent of time, which is not as in Bergsonism an ultimate reality, yet it is somehow connected with the time-process in which it is being realized. How time is retained and yet transcended in God we do not know, nor can we. Yet we are not without a clue. In mystical contemplation and in artistic enjoyment the sense of time, as we are told, may almost vanish from the consciousness; and it is claimed that the life of the philosopher or artist bears in this respect some kind of analogy to the divine life. It is at least suggestive of the idea for which Pringle-Pattison contends, that purposive activity is the concrete reality and time only the abstract form.[1] If this be so, then Bosanquet's criticism of teleology, in the sense of 'aiming at the unfulfilled,' is so far met. Such a teleology, he says, gives undue importance to time and to the last term of a time-sequence.[2] But, says Pringle-Pattison:

'The last term is only important because in it is most fully revealed the nature of the principle which is present throughout. It is precisely this linkage of the first term with the last and, to that extent, the transcendence of the mere time-sequence in the conception of an eternal reality, that seems to me to be expressed by the profound Aristotelian idea of τέλος or End.'[3]

(*g*) The question may be raised here whether the purpose that may be attributed to the infinite ground of the universe is to be regarded as conscious or unconscious. On this question Bergson would appear to range himself in the succession of Schopenhauer (*q.v.*) and von Hartmann,[4] with this difference that for them the gates of the future are closed. Undoubtedly the *via media* of unconscious purpose avoids the difficulty of explaining how one self-consciousness may exist within another, the finite within the infinite, but it possesses inherent difficulties of its own. It has to account for inorganic arrangement and process, and for the transition from the unconscious to the conscious and self-conscious, nor can it explain the reason why the vital impetus should tend in one direction rather than another.

'If,' as W. R. Sorley says, summing up an illuminating discussion, 'purpose be admitted as necessary for the interpretation of organisms, and if organisms are held to have arisen out of inorganic material, then there is good reason to postulate that the process which led to organic and purposive life was itself animated by purpose,' not individual nor merely racial purpose, but universal purpose acting, moreover, not 'after the fashion of impulse' but 'in the manner of mind or consciousness.'[5]

This theistic postulate of universal conscious purpose is to be justified in face of the facts of dysteleology,[6] yet it appears a more reasonable postulate than that of unconscious purpose, and more hospitable too of human experience in the realms of fact and value.

8. Teleology and value.—The category of end or purpose, when purged of its finite incidents of preconceived plan and external adaptation of means to end, tends to pass into the category of worth or value (*q.v.*). In the teleological view of the universe the end, which is the nature of the whole, is an ethical end worthy of being purposed, *i.e.* worthy, so to speak, of enlisting the desire

and effort of the Absolute. And may we not attribute desire and effort—conative activity—to God? May we not say that in the Infinite Experience conation and its correlative satisfaction are to be found, that, as Bosanquet[1] strikingly puts it, 'the contradiction of a conation co-existing with fruition must somehow be realized'? It seems to us that we must say this if the world is to be regarded as truly a 'vale of soul-making,' in which Providence rules and not fate, the concurrence of the living God and not the eternal decree, and in which spiritual values are created and realized. It is our belief that God is thus present and active in the process of the world, and that the true image of Him is not the pre-existent Creator of the deistic theology, nor the static timeless Absolute of acosmic pantheism, but the eternal Redeemer of the religious consciousness.

LITERATURE.—The literature of which the writer has made most use is mentioned for the most part in the footnotes. For the historical discussion of the subject histories of philosophy may be consulted. For the general history of philosophy, J. E. Erdmann (Eng. tr., 3 vols., London, 1890–91), F. Ueberweg[8 and 9] (4 vols., Berlin, 1898–1903), W. Windelband (Eng. tr., New York and London, 1893), A. K. Rogers[2] (London, 1907), A. B. D. Alexander[2] (Glasgow, 1908), C. C. J. Webb (London, 1915). L. J. Henderson, *Order of Nature*, Cambridge, U.S.A., and London, 1917, contains a useful sketch of the subject from the scientific standpoint. For ancient philosophy, E. Zeller (5 vols., Leipzig, 1876–1909), T. Gomperz (Eng. tr., 4 vols., London, 1901–12), W. Windelband (Eng. tr., London, 1900), R. Adamson (Edinburgh, 1908); also the works of E. Caird, J. Adam, and J. Burnet already mentioned. For modern philosophy, H. Höffding (Eng. tr., 2 vols., London, 1900), *Modern Philosophers* (Eng. tr., do. 1915), R. Adamson (2 vols., Edinburgh, 1903, esp. vol. i.), J. T. Merz—for nineteenth century—(esp. vols. 3, 4, Edinburgh, 1912–14), B. Pünjer, *Hist. of the Christian Philosophy of Religion* (vol. i., Eng. tr., Edinburgh, 1887); A. Caldecott, *The Philosophy of Religion*—for England and America—(London, 1901). For the systematic discussion works on metaphysics, philosophy of religion, and philosophy of science may be consulted: in addition to the works already mentioned, J. Johnstone, *The Philosophy of Biology*, Cambridge, 1914; *The Philosophical Review*, vol. xxvii. no. 6 [1918] (a series of articles on 'Mechanism and Vitalism'); *Mind*, new ser., no. 113 [1920] ('The Categories of Biological Science,' by F. H. A. Marshall); R. Otto, *Naturalism and Religion*, Eng. tr., London, 1907; J. Watson, *The Interpretation of Religious Experience* (*Gifford Lectures*), 2 vols., Glasgow, 1912 (historical and constructive); J. Lindsay, *A Philosophical System of Theistic Idealism*, Edinburgh, 1917; O. Pfleiderer, *Philosophy and Development of Religion* (*Gifford Lectures*), 2 vols., do. 1894; P. Janet, *Final Causes*, Eng. tr.[2], do. 1883; A. Trendelenburg, *Logische Untersuchungen*[2], Leipzig, 1862, ii. 1 ff.; C. Sigwart, *Kleine Schriften*[2], 2 vols., Freiburg, 1889, 'Der Kampf gegen den Zweck,' ii. 24–67 (a useful essay); W. Wundt, *Logik*[3], 3 vols., Stuttgart, 1906–08; P. N. Cossmann, *Elemente der empirischen Teleologie*, do. 1899; L. T. Hobhouse, *Development and Purpose*, London, 1913; V. F. Storr, *Development and Divine Purpose*, do. 1906. The 'argument from design' is sympathetically discussed from a theistic standpoint in the last-named work, also by J. Martineau, *A Study of Religion*, 2 vols., Oxford, 1900; A. C. Fraser, *Philosophy of Theism*[2] (*Gifford Lectures*), Edinburgh, 1899; C. C. J. Webb, *Problems in the Relations of God and Man*, London, 1911; A. J. Balfour, *Theism and Humanism* (*Gifford Lectures*), do. 1915. See also J. M. Baldwin, *DPhP*, iii. B. 2. 1, for a full bibliography. See also the artt. END, EPISTEMOLOGY, THEISM, THEODICY, VALUE.

WILLIAM FULTON.

TELEPATHY.—Telepathy, 'feeling from afar,' is a term coined by F. W. H. Myers, on the foundation of the Society for Psychical Research in 1882, to express the apparently supernormal transmission of information from mind to mind in 'thought-transference' experiments and the like, just as 'telæsthesia' was suggested to cover the alleged facts of clairvoyance and clairaudience. It was defined as 'communication between one mind and another otherwise than through the known channels of the senses.' As thus defined, the notion was in the first place not free from vagueness. For, as a certain amount of hyperæsthesia of the known senses was admitted to occur under exceptional conditions, and this could be so extended as to amount to miracle, while it yet in a way explained away miracle, it was not clear how hyperæsthesia was related to 'telepathy.' Secondly, the definition was essentially negative, a declaration of ignorance, which suggested no agency or adequate cause for the phenomena it described. Now this was neither satisfactory nor a very strong or stable position logically. Even if the difficulty about the limits of hyperæsthesia is not raised, and if it is admitted that the possibilities of communication through the senses may be taken as fairly completely explored, we are impelled to develop such a definition in one of two directions. We may imagine some unknown sort of vibration, radiation, or 'brain-wave,' as a physical explanation of the phenomena alleged, undeterred by the facts that no positive support has yet been found for any such agency, and that, unlike physical forces, it would appear to be indifferent to distance; or else we may conceive telepathy as essentially psychic in its nature, and shall then tend to exalt it into a fundamental 'law' of spiritual being, as Myers himself subsequently inclined to do. But, so conceived, it is manifestly a challenge to further exploration of the spiritual world of which it claims to be a law; and yet it proves rather a double-edged weapon for believers in a spiritual world. It enables them indeed to hold that every mind, incarnate or discarnate, may in principle communicate directly with any other by telepathy; but it seems to formulate this possibility so broadly as to render it almost impossible for a discarnate mind to authenticate itself by communicating information. For any verifiable information must normally be, or have been, known to incarnate minds; and, if any living mind can 'tap' any other, and if knowledge can 'leak' subconsciously from any mind to any other, and still more if we entertain the somewhat fanciful but not unsupported hypothesis that all knowledge may be pooled in a vast 'cosmic reservoir' before it bubbles up in individual minds, the telepathic hypothesis can evidently be used to discredit nearly all the *prima facie* evidence in favour of 'spirit-communication.' Accordingly the opponents of this belief have made great play with it, even while holding also that the evidence for telepathy is itself insufficient to establish it as a *vera causa*.[1] This objection the believers endeavour to meet in various ways. They point out rightly that, if telepathy is a fundamental psychic law, it cannot be restricted in its operations to living minds. They argue, however, that unrestricted telepathy between incarnate minds, and such alone, is antecedently improbable, and quite unsubstantiated. Lastly, they try to develop methods of experimentation which avoid this objection, because the information communicated, though verifiable *ex post facto*, can be shown never to have been, as a whole, in the possession of any living mind. Hence the importance of 'cross-correspondences' between the information received through several channels and dovetailing into a coherent message; by this method some striking successes have been recorded, though different minds will long continue to vary widely in the estimation of their weight. Again, certain sorts of prediction may baffle explanation by telepathy. At present, however, no agreement, either about the nature of telepathy or about the degree to which it may be taken as a fact in nature, can be said to exist. More evidence is still required, and, until it is obtained, opinions will be determined not so much by the evidence itself as by the bias with which it is regarded.

The existing evidence is usually classified under the heads (*a*) *experimental* and (*b*) *spontaneous*. The former includes the evidence of hypnotization at a distance, recorded especially by Gibert and

[1] *Proceedings of the Aristotelian Society*, 33rd session, 1911–12, p. 251.

[1] Cf. art. PSYCHICAL RESEARCH.

Pierre Janet, and experiments at close quarters, though without contact between the 'percipient' and the 'agent,' in guessing such things as cards and numbers, in reproducing diagrams and figures, etc. The transition to the 'spontaneous' evidence is mediated by a few rare cases in which the experimental projection of a phantasm is attested, on the strength of which it becomes possible to conceive the ordinary 'ghost' as an apparition telepathically projected by the dying or the dead. In all these cases the transfer of information has an emotional interest which is generally lacking in experiments of the first class, and this may conceivably account for their apparent capacity to override the obstacle of distance, which conspicuously differentiates them from the former. Still it should be remembered that to ascribe these phenomena to telepathy is a hypothesis which is possible only if telepathy is established independently by experimental evidence. Accordingly it is on this that the real stress falls. Now, as regards this evidence, it may be said in general that its character is very similar to that for other supernormal phenomena. Much of it is bad, some respectable, none beyond cavil. Its quality is not better than that of the best evidence for some of the most extreme phenomena, such as 'materializations.' It is liable, moreover, to the same or similar sources of error, fraud (in the shape of codes, collusion, and mendacity), mal-observation, lapses of attention, errors of memory, coincidence. The ultimate reason for these defects is that there plainly does not exist as yet any real experimental control of the phenomena and their conditions, so that the evidence cannot be accumulated at will, crucial experiments cannot be made, and the pragmatic test cannot be used to *apply* the doctrine of the direct intercommunication of minds and to distinguish the real from the alleged phenomena. As, however, this sort of situation occurs commonly enough in the beginnings of a science and sometimes lasts for centuries, it is no disproof of the reality of what is now provisionally called 'telepathy'; it may well be dispersed by pertinacious and concerted investigation, and in any case the matter should not be left in its present ambiguity.

LITERATURE.—This is largely the same as given in artt. PSYCHICAL RESEARCH and SPIRITISM. There may be mentioned in addition E. Boirac, *La Psychologie inconnue*[2], Paris, 1912, and *L'Avenir des sciences psychiques*, do. 1917, Eng. tr., *Our Hidden Forces* and *The Psychology of the Future*, New York and London, 1918; the art. by F. C. Hansen and A. Lehmann in *Philosophische Studien*, xi. [1895] pt. 4, 'Ueber unwillkürliches Flüstern'; E. Parish, *Hallucinations and Illusions*, London and New York, 1897; J. E. Coover, *Experiments in Psychical Research at Leland Stanford Junior University*, Stanford University, Cal., U.S.A., 1917; L. T. Troland, *A Technique for the Experimental Study of Telepathy and other Alleged Clairvoyant Processes*, 1917. All but the first of these attack the historical evidence, with some success, while the last two confess also (almost) complete failure in repeating the card- and number-guessing experiments of the Society for Psychical Research.

F. C. S. SCHILLER.

TELUGU-SPEAKING PEOPLES. — See DRAVIDIANS.

TEMPERAMENT. — The doctrine of the temperaments is at once one of the earliest and one of the most persistent and popular efforts to classify the diversities of mental character in relation to bodily characteristics. It has always been recognized that there are broad differences of type in mind, and that some of these differences are inborn, and, practically at least, unmodified throughout life. It was natural that these should be looked for mainly in the feelings and emotions, which appear both more dependent upon the bodily constitution and less under individual control than either cognition or will. The temperament is accordingly a permanent disposition to certain forms or degrees of feeling, so far as such disposition is dependent on the inherited organic constitution. The number of temperaments has been variously given as two, three, four, six, eight, and even much larger numbers, but on the whole the classic 'four' has held the field down to our own day, as if it corresponded in some mysterious way to some ultimate differences in mind or body, or both.

This number was derived originally from the four elements of Empedocles, fire, earth, water, and air, and the four qualities, warm and cold, dry and moist; on these in turn was formed Hippocrates' theory of the four cardinal humours of the body—blood, corresponding to air, warm and moist; phlegm to water, cold and moist; yellow bile to fire, warm and dry; and black bile to earth, cold and dry. From these came through Galen the names of the main temperaments, *sanguine*, *phlegmatic*, *choleric*, and *melancholic*. Occasionally physiologists have suggested other terms for the phlegmatic and the melancholic, as 'lymphatic' and 'nervous,' lymph and nerve being at least known constituents of the body;[1] but the names as well as the number of the old four have kept their ground. For the Greeks the temperament meant a mixture or union of the four elements, qualities, or humours; where this contained a certain ideal proportion of each, there was bodily and mental health; where an excessive degree of one or more, or an excessive defect, there was distemper or disease. There should therefore have been only one ideal temperament, and a large variety of *in*temperaments,[2] but actually the four temperaments were regarded as falling within the limits of health and as implying only a slight predominance of one or other of the four qualities. With the progress of physiology, the physical basis of the temperaments underwent a series of changes in the conception of the theorists; first the mixture was sought in the blood itself, as conveying nutriment to all the tissues of the body—*e.g.*, the proportion of fibrin to fluid in the blood, the width of the vessels, the porousness of their walls and of those of the tissues; then stress was laid on the tissues of the body themselves, and especially the nervous tissue, its strength and its excitability (Haller); and finally on the more delicate qualities of the nerves as shown in intensity, and in rate, persistence, etc., of impression and of reaction. Here we are probably nearest to the truth, since it is with the nervous system that mental qualities and degrees are most directly correlated, but it must be admitted that we have no really scientific knowledge as yet of the precise relation of one to the other.

The problem may be approached from another side by considering the actual characterization or description of the four temperaments, the psychical qualities which each reveals; these are inferred of course from the behaviour, more especially the emotional expressions and the reactions of the will upon impressions; and here also there has been a constant tendency to simplify by seeking the main features of the temperaments in two pairs of mutually opposed characters, such as receptivity and spontaneity; change and persistence; feeling and action; pleasure and pain, etc. The most satisfactory of these psychological accounts is that of Wundt, based on the strength or weakness, and on the quick or slow rate of change in feeling and in mental life generally.[3] Strong and quick is the choleric temperament; strong and slow, the melancholic; weak and quick, the sanguine; weak and slow, the phlegmatic.

[1] Henle, *Anthropolog. Vorträge*, i. 108.
[2] Volkmann, *Lehrbuch der Psychologie*[4], i. 207 f.
[3] Wundt, *Grundzüge der physiologischen Psychologie*[5], iii. 637.

As E. B. Titchener has put it, 'the man who thinks quickly and feels strongly, is choleric, the man who thinks quickly and feels weakly, sanguine. The phlegmatic thinks slowly and feels weakly, the melancholic thinks slowly and feels deeply.'[1]

The classification does not adequately explain, however, the fact that the feelings of the sanguine are predominantly cheerful or pleasant, those of the melancholic predominantly painful or gloomy; and Höffding has suggested another pair of temperaments, or another division—'the bright and the dark temperament'—in order to explain 'the tendency to one or other of the two great opposites of the life of feeling, which gives colour and direction to the whole disposition.'

'This opposition is more fundamental than that upon which the other four temperaments are based, for it has its root in the fundamental conditions for the preservation of the individual organism.'[2]

More recently an interesting attempt to analyse the dominant characteristics by experimental methods has been given by Narziss Ach;[3] he finds that it is mainly on the strength or weakness of the 'determination,' along with the persistence or rapid falling away of the determining force, that the feelings, the associations, and generally the whole mental life depend; accordingly he makes these characters the basis of his five temperaments—for he adds a fifth, the *reflective* (*besonnene*) temperament.

Whatever the ultimate characters may be, mental or physical, they must be such as exercise a decisive influence on the whole life, inner and outer, of the individual. The facts that the pure temperament is rare; that it makes, as Volkmann says, 'an almost uncanny impression,' when it does appear; that most of us are of 'mixed' temperament (however illogical such mixture may be); that the old terms have lost all meaning, and that the scientific analysis is still to seek—these facts, which have led many psychologists to drop the doctrine of the temperaments altogether, do not dispose of the existence of broad and deep differences of mental type, mainly in the spheres of feeling and action, for which *some* names, and a scientific analysis, must be found.

The organism, through the afferent nerves, sends from its every part a stream of influence to the brain; to the functions of every tissue there correspond impressions and feelings which may or may not reach or effect separate consciousness, but which produce a mass-effect in the cœnæsthesia, or organic sensibility, and in the general feeling-tone which corresponds to it. This is the basis of the self-feeling: it is the inner or subjective aspect of the temperament. There is, as Henle says, a *tonus*, or degree of tension, in every nerve, even when the muscles which it contracts or the sense-organs from which it is impressed are 'at rest'; it differs in degree in different individuals; for each individual it varies from time to time, under varying conditions of health, fatigue, etc., but there is a relatively constant value for each below which it does not fall, so long as the nerves have life. Where the tension is high, response of feeling and action will be energetic and rapid; where it is weak, or low, response will be feeble and slow. The *tonus* is the physiological fact corresponding to the mass-feeling—vague and indefinite as it necessarily is—out of which the different moods of the individual, and his emotions, his passions, down to the simplest feelings of sensory pleasure and 'unpleasure,' emerge like waves on the sea. Like all feelings, the temperamental feeling is both an index of bodily condition and a cause of bodily expression and action; like all feelings, it influences alike the intensity, the quality, and the course of thought. Hence the detailed descriptions of character which we find in the older and even in some of the later writers on temperament are not without interest.

Johannes Müller,[1] who regards the *phlegmatic* as the highest type—the ideal temperament—finds that in such a man, with a well-developed intelligence, his phlegm enables him to accomplish results impossible to others, even with their livelier feelings and desires; easily retaining control of himself, he cannot be induced to acts 'of which he would repent on the morrow'; he can calculate in all security the chances of the success of what he undertakes; in danger, at the decisive moment, he is master of himself, wherever it is not a question of sudden decision and energy; 'he feels his ills little, and bears them patiently, nor is he much moved by those of others'; speed and quickness of choice often give others an advantage over him; but, 'when he has time before him, he arrives quietly at the goal, while others, heaping mistakes upon mistakes, are lost in endless side-issues.' On the other hand, Müller finds that the species of phlegm characterized by laziness, apathy, insensibility, irresolution, ennui, slowness of intellect, and the like, is not the true type, but a pathological form. The *choleric* has a remarkable power of action, both in energy and in persistence, under the influence of passion; his passions inflame at the least obstacle; his pride, his jealousy, his desire of vengeance, his thirst for domination, know no bounds, as long as his passion moves him. He reflects little, acts without hesitation, on the spur of the moment, because he is convinced that he is right, and above all because such is his will. He rarely turns aside from error, but follows the course of his passion to his own ruin and that of others. With the *sanguine*, pleasure is the dominant tendency, along with great excitability, and a short duration of any mood. Sympathetic and friendly to others, but without persistence or constancy; quick to anger, but equally quick to regret; prodigal of promises, but equally ready to forget them; credulous and confident, he loves to make plans, which he soon lays aside; indulgent to the faults of others, he claims the same indulgence for his own; easy to appease, frank, open, amiable, sociable, incapable of interested calculation. With the *melancholic*, sadness is the prevailing tendency; his excitability is equal to that of the sanguine, but disagreeable sensations are both more frequent and more durable than those of pleasure. The sufferings of others call out his sympathy to a high degree; for himself he is fearful, undecided, distrustful; a trifle wounds and offends him; the slightest obstacle discourages him, and renders him incapable of reasoning to overcome it; his thoughts are full of melancholy, and his sufferings appear to him beyond all consolation.

In their *Psychology in the Schoolroom*[2] T. F. G. Dexter and A. H. Garlick venture to describe, on behalf of teachers—for whom it is necessary to know their pupils' temperaments—not only the mental but also the external physical appearance of the types. The *sanguine*, lively, excitable, quickly but not deeply roused, with feeling generally uppermost in his character, has the circulatory and respiratory systems well developed, has red hair, blue eyes, skin fair, and face animated. The *choleric*, self-reliant and confident, with will uppermost, has the muscular system well developed, hair and eyes dark, complexion sometimes sallow, face impassive. The *phlegmatic* or lymphatic, mind heavy and torpid, sometimes nearly stupid, patient, self-reliant, and slow, has the abdomen large, face round and expressionless, lips thick, body generally disinclined to exertion. Finally the sentimental (i.e. *melancholic*), with great love of poetry, music, and nature, and marked indifference to the practical affairs of life, has the head large, eyes bright and expressive, figure slender and delicate, movements quick.

It may be doubted whether teachers would be well advised to guide their treatment by such physical characters as these, when noted in their pupils. Nor has the attempt been very successful to look in the different temperaments for predisposition to certain diseases of the body. It is, however, antecedently probable, and appears to be confirmed by experience, that different temperaments are liable to different forms of insanity; at least it is true that in insanity the differences of temperament are as clearly marked as in health.

As in drunkenness one man is 'talkative and boastful,' another 'maudlin,' another 'tetchy and violent,' another 'melancholy and silent'; so 'the lunatic of sanguine temperament . . . is puffed up and vain, his dreams are of marble halls and flattering voices; the choleric patient suspects everywhere the plots of his enemies, and hears voices insulting him or urging him to deeds of violence; and whilst his hallucinations are more often auditory than visual, the contrary is the case with the

[2] London, 1905, p. 343.

melancholic, and especially, as the name implies, with religious "visionaries."'[1]

It is especially in the melancholic, nervous, or, as it is called in extreme cases, the 'neurotic' temperament that the tendency to insanity is marked. T. S. Clouston gives a striking description of the modern phase of this temperament.

'The man of this temperament is in body small, shapely, tending towards a dark complexion, thin skin, with delicate features, a well-shaped head, a quick, bright, restless eye; in figure small and wiry, nervous, highly strung and sensitive, feeling pain keenly and tolerating it badly, subject to dyspepsia and insomnia. His muscles are incessantly active. He is quick in mind and body, imaginative, keen, sensitive, ever alert, fine in the grain, subtle, fond of intellectual work, not always resolute in decision because he sees there are two sides to every question, often artistic in feeling, ambitious, and with an ill-concealed contempt for fools. When run down, this man is "ill to do with." When he grows old he gets thin, dyspeptic, irritable, and often neuralgic. The diseases he is specially subject to are nervous and mental.'[2]

In religious psychology also the temperaments are of considerable importance, owing to the great suggestibility of some (the sanguine and melancholic) as compared with others, the greater excitability of the sanguine and choleric, the brooding tendency of the melancholic or nervous, the insusceptibility of the phlegmatic, and the excessive self-centring of the sanguine and choleric.[3]

The relative permanence of the temperament in the individual is not inconsistent with some gradual change over long periods of time, although there is no doubt that the temperament is that part of our mental and physical endowment which requires greatest effort or most violent and prolonged change of circumstances to modify. It has been thought that broadly the different stages of individual development and of racial evolution are marked by differences of temperament. Childhood is sanguine, youth sentimental or nervous, mature age choleric, and old age phlegmatic. The temperaments of primitive races are less obvious, but they seem to move from the phlegmatic and choleric (Negroes, Malayans) to the melancholic and sanguine (Mongolian, Caucasian); in Europe we have the sanguine Frenchman, the choleric Spaniard or Italian, the phlegmatic Teuton, and the nervous Briton. Women on the whole are sanguine or nervous, men choleric or phlegmatic.[4] These are of course mere rough general impressions. It has also been remarked that there has been a change of fashion in temperaments, or in what has been regarded as the ideal temperament: at one time the sanguine, it became the dark and melancholic (in the days of Byron), later the phlegmatic or indifferent, to-day perhaps the choleric—the man of energy.[5] Character in the highest sense of the word is something very different from temperament; the latter has to do with the form and manner, the quantity and degree of mental life, character with its quality, the intellectual, moral, and æsthetic values which that life recognizes and pursues; temperament gives the foundation on which character must build—it sets the problems which the training and the making of character have to solve; whatever we may think therefore of the popular classification of the four temperaments, the individual differences themselves on which it is based—differences of sensitiveness to impressions and to feelings, of strength and quickness of reaction, of energy and endurance—are of the utmost importance. It is to such differences and their measurement that the modern individual psychology is directing its attention; and from it we may hope in time to obtain a scientific account of temperament.

J. LEWIS MCINTYRE.

TEMPERANCE.—

There is much difference of opinion among writers on moral theology as to the true relationship between the three virtues of sobriety, moderation, and temperance. Each has had its claims to be the archetypal virtue, which includes the others, advocated by representative writers; but there seem to be very strong reasons why temperance should be regarded as the inclusive virtue, the chief being that it has held a place from early times among the 'cardinal' or principal virtues. From the first, Plato seems to accept this grouping of virtues as based upon a current classification, and it passes through Aristotle and Stoics into Christian thought. The definition of temperance given by Cicero may be accepted as typical:

'Temperantia est rationis in libidinem, atque in alios non rectos impetus animi, firma et moderata dominatio. Ejus partes sunt, continentia, clementia, modestia.'[1]

Plato shows a tendency to identify 'temperance' with 'continence'; in *Rep.* iv. 430 E he defines σωφροσύνη as follows:

κόσμος πού τις ἡ σωφροσύνη ἐστὶ καὶ ἡδονῶν τινῶν καὶ ἐπιθυμιῶν ἐγκράτεια.

Aristotle, however, defines the word as *μεσότης περὶ ἡδόνας* and distinguishes it from *ἐγκράτεια*. The temperate man (*σώφρων*), he says, does not feel the pressure of inordinate desires; the continent (*ἐγκρατής*) feels it, but holds desire in restraint.[2] So Cicero: 'Continentia est, per quam cupiditas consilii gubernatione regitur.'[3] In the NT the word *σωφροσύνη* occurs only in 1 Ti 2^{15} (*σώφρων* in 1 Ti 3^{2}, Tit 1^{8} $2^{2,5}$). *ἐγκράτεια* occurs in Ac 24^{25}, Gal 5^{23}, 2 P 1^{6}; *ἐγκρατεύομαι* in 1 Co 7^{9} 9^{25}; *ἐγκρατής* in Tit 1^{8}.

The general idea of temperance or moderation as an element in all virtue is peculiarly Greek, and it re-appears in Christianity.

'Temperance,' says Aquinas, 'is a cardinal virtue because that *moderation* which is common to all the virtues is peculiarly praiseworthy in the case of temperance.'[4]

This has been pointed out elsewhere.[5] It is perhaps most in accordance with modern ways of thinking to take as a basis the fact of personality and to consider the Christian as standing in a threefold relationship—to God, to his neighbour, and to himself. According to Augustine, there is a virtue corresponding to each of these relationships, as is implied in Tit 2^{12}, *ἵνα . . . σωφρόνως καὶ δικαίως καὶ εὐσεβῶς ζήσωμεν.*[6] Temperance is the form which

[4] *Summa*, II. ii. qu. cxli. art. 7, concl.; cf. Aug. *de Beata Vita*, 32: 'Modestia utique dicta est a modo, et a temperie temperantia. Ubi autem modus est atque temperies, nec plus est quidquam nec minus.'

[5] See art. MODERATION.

[6] Bern. *Serm. 2 in temp. Res.* 11, alludes to this passage: 'Haec enim tria sunt conversationis nostrae maxime necessaria: quoniam primum debemus nobis, secundum proximo, tertium Deo.'

true self-love, duty to self, necessarily takes. It is the spirit of discipline, or rather the spirit of love consecrating itself—body, soul, and spirit—to God.

The function of temperance 'consists in restraining and moderating the desires wherewith we yearn for those things which are apt to turn us away from God's laws.'[1]

Hence the virtue of temperance consists in the moderate and regulated use of those pleasures of sense, especially of touch and taste, which are most apt to draw the soul away from God, and to overthrow the supremacy of the rational faculty in man.[2] Temperance implies the control of appetite at those points where its demand is most importunate and difficult to resist. While 'moderation' (*modestia*) means self-control in matters of less difficulty, 'temperance' is concerned with the instincts and passions which in average human nature are the strongest and the least easy to restrain.

The following points seem to be worthy of special note.

1. The aim of the 'temperate' man is *positive*, not negative. He aims not merely at the subjugation of his lower nature, but at the cultivation of moral and spiritual power. Temperance is the virtue of the man of high ideals who strives to win a 'sovereign self-mastery.' It implies 'no monotonous restraint, but an ordered use of every gift.'[3] The temperate man faces life and uses its gifts and blessings in the temper of an athlete training for a contest (1 Co $9^{25f.}$) or of a soldier engaged in a campaign (2 Ti $2^{3ff.}$). He exercises self-control 'not only in cutting off superfluities but in allowing himself necessaries'[4]—watchful against any form of self-indulgence that may bring him under the power of the world or of his lower nature (1 Co 6^{12}). He is not hindered or overpowered by circumstances, but controls them; he makes them subservient to his spiritual progress; he passes through them upwards and onwards to God.

So Augustine describes temperance as 'that action whereby the soul with the aid of God extricates itself from the love of lower (created) beauty, and wings its way to true stability and firm security in God.'[5]

2. Temperance holds a very prominent place in the earliest Christian teaching (cf. Ac 24^{25}). In the *Acts of Thecla* the substance of St. Paul's teaching is described as λόγος θεοῦ περὶ ἐγκρατείας καὶ ἀναστάσεως. In the early Christian usage of the word ἐγκράτεια was probably identified with sexual purity, and was gradually extended to include any form of world-renunciation and mortification of the body.[6] The words ἐγκράτεια, ἐγκρατεύεσθαι occur frequently in Hermas, but already the tendency is to connote by them the temper of self-control or temperance in general.[7] It includes control of appetite in the sphere of sex, food, and drink; but also the temper of moderation in expenditure, of sobriety in judgment and self-esteem, of self-restraint in matters of speech, etc. There follows a list of virtues in respect of which δεῖ μὴ ἐγκρατεύεσθαι. According to Hermas, ἐγκράτεια is in fact an archetypal and inclusive virtue. It is coupled with ἁπλότης in *Vis.* ii. 3.[8] It has a saving virtue. The 'first commandment' is ἵνα φυλάξῃς τὴν πίστιν καὶ τὸν φόβον καὶ τὴν ἐγκράτειαν.[9] Self-restraint is a fundamental duty because it is directly involved in that conflict between flesh and spirit which is the condition of our mortality and the occasion of moral victory or defeat. So Augustine asks:

'Cui peccato cohibendo non habemus necessariam continentiam, ne committatur? . . . Universaliter ergo continentia nobis opus est ut declinemus a malo.'[1]

3. Temperance or self-control forms part of 'the fruit of the Spirit' (Gal 5^{22}). 'Walk in the spirit and ye shall not fulfil the lust of the flesh.' As a gift or endowment of the Spirit it was supremely manifested in our Lord.

'Where,' asks Bernard, 'is temperance to be found if not in the life of Christ? Those alone are temperate who strive to imitate *His* life, . . . whose life is the mirror of temperance.'[2]

It is of self-control that Augustine is speaking when he exclaims, 'Da quod jubes et jube quod vis.'[3] The presence of the Spirit in man gives him liberty—the true freedom which consists not in following the impulses of the lower nature, but in fulfilling the will of God. Accordingly in Eph 5^{18} St. Paul seems to imply that the one infallible safeguard of temperance is the realization of the presence and action of the Holy Spirit in the soul.

4. The sin of intemperance is wrongly limited to one particular form of excess.[4] It may include want of restraint in work, in recreation, in intellectual speculation, in the pursuit of wealth or power, in the use of the faculty of speech. On this last point much stress is laid by some Christian moralists.[5] The fact is that the habit of loose, unrestrained speech paves the way for grave lapses from truth, purity, or good faith. It 'defiles the man' (Mt 15^{11}). It hinders or weakens that power of controlling 'the whole body' (Ja 3^{2}) which is essential to Christian perfection. St. James implies that the 'sovereign sway of the Christian conscience' must be exercised even in what seems a small sphere, and thence gradually extended to the whole field of human nature till man becomes 'Deo solo dominante liberrimus.'[6]

R. L. OTTLEY.

TEMPLES.—A temple, in the original sense of the Latin word *templum*, meant a rectangular place marked out by the augur for the purpose of his observations, which were taken within a rectangular tent. An extended sense gave it the meaning of a consecrated place or building, of rectangular shape, 'inaugurated' by an augur. In this sense it was applied to the house of a god, though, strictly speaking, this meaning belonged to the *ædes*. In its primitive sense *templum* corresponds to the Gr. τέμενος, a place marked off as sacred to a god, in which a ναός, or house of the god, might be erected. As we shall see, an enclosed consecrated space often precedes an actual temple in our sense of the word, viz. the house of a god, a structure containing his image, and sometimes an altar, though not infrequently the altar stands outside the god's house (as in Greece) but within the sacred place, in the open air, as it did before any house for the god was erected. As images became more decorative and costly, it was natural to provide a house for them, though this might be done for a quite primitive image or even a fetish.[7] Less often, however, the chamber or house of the god contained no image; it was merely a place where he might invisibly dwell or which he might visit

from time to time.[1] Where a god has his image in such a place, those of other divinities may also stand there or in subsidiary chambers connected with it. In the popular sense of the word, 'temple,' while it is connected with worship, is not usually a place within which the people worship. The priests alone enter it; the laity may worship only within the precincts, if even there. Temples vary from the simplest and smallest buildings, as they mostly were at first, to the most elaborate and vast structures.

In studying the origin of temples, no single source for all can be found, as this differs in different regions. Nomads could have no temples, though they might have tribal sacred places, or sacred tents carried in their wanderings. With the advent of a more fixed mode of life and permanent dwellings, a similar dwelling for the deity became necessary, as is seen in 2 S 7[2]. A variety of primitive temples is known, and it could have been only in the course of a long period of time that the more elaborate buildings came into existence, while, generally speaking, the intermediate stages are not always discoverable.

1. **Origin of temples.** — (*a*) *Sacred places.* — Among savages, and probably also among most groups of primitive men,[2] most of the rites of worship are carried on in the open air, sometimes because no images of divinities exist, or, where they do, they are not always enclosed within walls, and sometimes because spirits are regarded as connected with natural objects. Sacrifices are simply laid on sacred stones, or cast into the waters, or into the fire, or hung upon trees.[3] Worship takes place in the open air among many of the lowest tribes (Veddas, Australians, Mūṇḍās and other Dravidian tribes, Melanesians, Sakai, and Jakun), as well as among tribes at a higher level (some American Indians, Lapps, Buriats, etc.). This is often the result of a nomadic life, yet even nomads carry sacred images with them[4] or have a tent for these or for other sacred things.[5] Such open places for worship tend to become sacred and to be preserved inviolate for cult purposes, and there images are set up.

Examples of this are found among the Sakai, Jakun, Mūṇḍas, Fjort, and Indians of California.[6]

This is obviously necessary where a sacred tree or stone stands in such a place. Sometimes sacred places are associated with the traditional appearances of spirits, gods, or ancestors, and must therefore be holy for all time. The mere fact that a religious gathering takes place in a certain spot once is enough to give it sanctity, and the gathering becomes recurrent there. Such sacred places will usually be marked by images or symbols, or by boundary-stones forming an enclosure.[7] Single graves, often with a structure over them, and places of sepulture also become recognized places of cult.

The same preference for open-air worship in a recognized sacred place is found among the Chinese—*e.g.*, in the cult of the Altar of Heaven, which dates back to early times when the *genius loci* was worshipped at an altar under a tree.[8] The practice is also found in the primitive cult of the Indo-European races, as a result of their conceptions of deity, not dissimilar from those of savages. The sacred stone, the sacred tree or grove, the sacred spring, were places of cult and usually possessed an altar. The limits of the τέμενος were marked by boundary-stones, and within these stood an altar and a stone or post in which the deity resided. In early Indian worship there were no temples nor indeed permanent sacred places for cult—probably a result of earlier nomadic conditions prevailing after the people had become settled—and to some extent this is the case even now when temples have existed for centuries. So in early Rome there were holy places but no temples; and in ancient Persian religion there were neither images nor temples.[1] The custom and method of building temples were borrowed by the Romans first from the Etruscans and then from the Greeks. Teutons and Celts also worshipped first in the open air, and in their case the earlier cult is especially associated with the sacred tree or grove, though a spirit or god might be worshipped also on a mountain top, in a cave, or at a spring.[2] For the Gauls the evidence of Lucan is interesting in the passage where he describes a sacred grove near Massilia. The grove was tabu to the people; even the priest feared to walk there at midday or midnight, lest he should meet its sacred guardian. The trees were stained with sacrificial blood, but there were also altars, and the images of the gods were misshapen trunks of trees. The marvels of the grove are of a mythical kind.[3]

While sacred groves were general over the Celtic area, temples had begun to be built in both Cisalpine and Transalpine Gaul. The Boii had a temple in which were stored the spoils of war, and the Isubri (Isombri) had a similar temple.[4] Plutarch speaks of the temple where the Arverni hung Cæsar's sword, and Diodorus of 'temples and sacred places.'[5] The temple of the Namnite (Samnite) women, unroofed and re-roofed in a day, must have been a simple building.[6] In Gallo-Roman times elaborate temples were built after Roman models, as well as smaller shrines at sacred springs.[7]

Similar sacred groves existed among the Teutons, as many passages of Tacitus show.[8] 'What we figure to ourselves as a built and walled house, resolves itself, the farther back we go, into a holy place untouched by human hand, embowered and shut in by self-grown trees.'[9]

The use of the sacred grove continued during many centuries. But in these groves simple temples also stood, and are referred to by Tacitus, while sagas and later ecclesiastical writings speak of them, and the latter show that, when they were destroyed, a Christian church was often built on the site.[10]

The Latin names used for these are *fanum*, *casula*, and *templum*. The first was probably a mere hut in which stood the sacred image; the others were more elaborate buildings, whether of wood or of stone.[11]

The grove is thus a primitive holy place, which may have as an accessary a small structure for the image which later becomes a more elaborate temple. This worship in groves, which might become the seat of a temple, is also found among lower races.

The village shrine among the Dravidian tribes of India is an example. Under a sacred tree or grove stands a heap of stones or a mound; this may be replaced by a mud platform or a mud hut with a thatched roof, or by a small building of masonry with a domed roof and platform. These form an abode for the deity and are thus a primitive kind of temple.[12]

The early Semitic sanctuary was a sacred place associated with a theophany or with the continued presence of a spirit or divinity. This might be at a tree, a stone, on a hill, or in a cave.

These holy places were sacred territory enclosed by boundary stones or walls, with altar and *ashērāh*, or sacred pole. The 'high place,' or *bāmāh*, as its name denotes, was on a height, and in the enclosed space or court there were the altar, the *ashērāh*, and the *maṣṣēbhāh* (*q.v.*) the abode of the divinity), while connected with these were 'houses,' probably of the priests, which sometimes contained images (2 K 17[29]), though these were also enclosed in tents (2 K 23[7], Ezk 16[16]).[13] These houses or tents represent a primitive temple within the *bāmāh*, and, though no clear traces of actual temples have been met with in excavations, these may have been the origin of actual Canaanite temples such as those at El Berith and Gaza (Jg 9[46]).

[13] A tent was used as a sanctuary in the temple of Beltis at Harran, and elsewhere (D. A. Chwolsohn, *Die Ssabier und der Ssabismus*, St. Petersburg, 1856, ii. 33), and by the Carthaginians as a portable shrine (Diod. Sic. xx. 65).

16[29]), probably consisting of an outer hall and an inner sanctuary for the image. The tents referred to resemble that provided for the Ark by David (2 S 6[17]), though it had previously been kept in some kind of building (1 S 3[3-15]; cf. 2 S 7[6f.]), just as there were family or tribal houses of a god (Jg 17[5] 18[18. 30c]). Remains of simple Phœnician temples suggest Egyptian influence; they are little more than a *cella*, rectangular, but open in front.[1]

Examples of 'high places' among other races are found among the Aleuts and Bhils,[2] while they existed also in primitive Greek religion, and indeed wherever a cult was carried on on hilltops.

(*b*) *Shrines at graves.*—The grave as a sacred place may be another point of departure for the temple, when it is associated with a structure—though it be no more than an enclosing wooden fence with shrubs, as among the Tami of New Guinea[3]—where a cult is carried on. Sometimes an altar is placed over a grave, as with the Mayans and possibly the Nicaraguans,[4] and by the Chinese for the half-yearly sacrifice to the spirits of the dead.[5] Sometimes a series of memorial stones is erected, not always, however, over a grave, like the menhirs and dolmen-like structures of the Khāsis,[6] the stone circles with a rectangular niche in their circumference found in Algeria, the rectangular, elliptical, or circular groups of stones in Syria,[7] and the stone circles in Britain, varying in size and elaboration up to that at Stonehenge.[8]

These circles, long regarded without evidence as 'Druidical temples,' were probably connected with a cult of the dead in pre-Celtic times, and so were a kind of temple, like the Fijian *nanga* presently to be referred to. Some have regarded such a circle as that of Stonehenge as a temple dedicated to the sun or other heavenly bodies.[9]

Akin to these are the sacred stone enclosures, or *nanga*, of the Fiji islanders, now existing only as ruins.

These formerly presented the form of a rough parallelogram enclosed by flat upright stones, divided into three compartments by cross walls called respectively the little, great, and sacred *nanga*, the last enclosing the sacred *kava* bowl. Trees stood round the enclosure, and outside, beyond the sacred *nanga*, was the *vale tambu* ('sacred house'), a bell-roofed hut. Here the foreskins of youths circumcised on behalf of a sick parent were offered to ancestral gods with prayers for the patient's recovery. In the *nanga* 'the ancestral spirits are to be found by their worshippers, and thither offerings are taken on all occasions when their aid is to be invoked,' and here firstfruits are presented to them. They were also used in the elaborate initiation ceremonies, the object of which was the introduction of the candidates to the ancestral spirits.[10]

Where large chambered tombs exist, as they do in many parts of the world, they have been used for worship of the dead, either at the time of the burial or at stated intervals thereafter. To this extent, therefore, they form temples, and sometimes they contain a conventional image of the dead like the human figures roughly sculptured on the walls of rock-hewn tombs in France.[11] The structures built over graves may be no more than large huts, of logs and thatch, like those built over the graves of kings and chiefs among the Banyoro and Baganda, but these are regarded as temples, with priests and attendants, where the spirits of the dead are consulted.[12]

In Fiji certain temples of a primitive kind are associated with graves and with the cult of the *kalouyalo*, or ancestor-gods.[13] Not unlike these are the huts of reed and grass built over the graves of chiefs in pre-historic Egypt, where offerings were made. They gave place to mud houses, and these again to structures of stone. Of the latter the *maṣṭaba* had a chamber for the statue of the deceased and a tablet for offerings. Funerary chapels were part of the tomb-structure, but, where pyramids were built, this chapel or temple was erected outside the pyramid, and in it gifts and offerings were made. Sometimes they developed into large temples, which, like the smaller funerary chapels, had lands attached to them for their maintenance.[1]

(*c*) *Caves and temples.*—Caves occasionally served as scenes of a cult, and by their shape and enclosed space may have suggested the structural temple. The caverns of mid-Magdalenian times, which contained elaborate paintings of animals or even of human figures, have been regarded as the scene of religious or magical rites, but of this there is no direct evidence.[2] Where cave-dwellers used part of the cave as a shrine for an image or fetish, it might easily through conservatism still be regarded as the dwelling of a god, when men no longer used it for a dwelling. It might become a temple or be associated with a temple built above it. Caves used for burial purposes would doubtless also acquire a sacred character and be used for commemorative rites.

Thus some of the Canaanite 'high places' are associated with caves, which may have been abodes of the living or burial-places, and which, it has been conjectured, were used for oracular purposes or regarded as sanctuaries of a god.[3] Natural or artificial grottoes also constituted the earliest Phœnician temples.[4] An example of gods incarnate in animal shape inhabiting a cavern which served as a temple occurs in Fiji in the case of the gods Ndengei and Ratu-Mai-Mbulu, to whom prayers and offerings were made there.[5] Names of divinities worshipped in caves among the ancient Berbers are known, as well as the caves themselves with inscriptions to them. Sacrifices were probably offered in front of the entrance; within the cave niches contained sacred objects.[6] Rock temples are known in early Egypt and in N. Arabia, but they are most elaborate in India and Ceylon, where they are both hewn out of solid rock and sculptured in caverns. Some originated in Buddhist times, and many still exist as examples of striking architectural skill—*e.g.*, at Elephanta and Ellora.[7] Their prototypes are caves used as shrines and for the cult of Hindu gods in N. India.[8] Among the Caribs two caves were the places where sun and moon emerged and fertilized the earth. They were places of pilgrimage, were adorned with paintings, and contained images. Spirits were supposed to guard them.[9]

Another reason for caves becoming associated with worship is the belief that men first came out of them from their subterranean home. Examples of this are found in ancient Peru and other parts of America.[10]

Caves may also be the depositories of sacred or cult objects or of images of gods, and thus serve a purpose to which temples are also put.

The Arunta *ertnatulunga* is a rock crevice and sacred store-house containing *churinga* and their indwelling spirits. They are visited ceremonially and are highly sacred.[11] The Veddas keep their sacred arrows in caves to prevent them from being contaminated, especially by women.[12] The Hopi use clefts in the rock in which to place the *bahos*, or prayer-sticks, in honour of their deities, and the Coras and Huichols deposit ceremonial arrows and images in sacred caves.[13] The Ostyaks keep their images or stones representing the gods in sanctuaries in the hills guarded by a shaman.[14]

(*d*) *The village-house, men's house, etc., as temple.*—In many regions where separate temples are unknown, the men's house, council-house, village-house, or the *kiva*, to some extent serves the purpose of a temple among its many other uses, and corresponds to the *prytaneum* of the Greeks and the *curia* of the Romans.

Religious dances or sacred dramatic plays are held in the 'village-house' among the Aleuts or in the 'assembly-house' of the Californian tribes, which may consist of a circular dome-shaped structure or a mere brushwood enclosure.[1] To the latter corresponds the bough *wurley* used in the fire-ceremony of the Warramunga tribe, in which certain men maintain for hours a continuous singing to the accompaniment of beating boomerangs.[2] Among many American Indian tribes, especially in the south-west, religious rites are associated with a 'sacred house,' as with the Hupa, which does not differ in construction from other houses in the village. Here sacred dances take place, and traditions are connected with it.[3] With the Pueblo tribes the *kiva* serves at once as sacred council-house, medicine-lodge, and temple of the members of a mystery society. In some districts *kivas* of ancient date are circular; more generally they are square and often below the surface of the ground. The pre-historic *kivas* of Colorado and Utah are of similar type. Women might not enter the *kiva* except to give food to husband or sons. *Kivas* are often very large, but the well openings are small, and entrance is gained by a ladder up to the roof, whence by another ladder descent is made to the interior from a hole in the roof. The walls are often decorated with symbolic paintings and are surrounded by a bench. At one end is an altar on which the symbolic objects of the society are placed, and before it is a dry sand 'painting,' representing gods and forces of nature.[4] Corresponding to these are the sacred lodges and club-houses of Melanesia and Papua, which are generally the nearest approach to temples in those regions. Examples are found in the 'sacred houses' of the Solomon Islands;[5] in the *toreu* of New Britain, etc.—a sacred enclosure with a large room where the dresses and masks were prepared and members of the society met, whence the spirit-personators of the ceremonies emerged, and which no woman or uninitiated male might approach;[6] in the *marawot* of the Bismarck Archipelago, a similar construction to the *toreu*, but with a special part containing images and visited by the *tena*, or magician, alone;[7] and in the house used in the *asa*-cult at Astrolabe Bay, where an ancestor-cult is practised.[8] The structure consisted mainly of wood and thatch. The 'men's house' in the same regions has often a sacred significance, and contains skulls and beads, effigies of the dead, and symbols associated with ancestor-worship, and sometimes masks, drums, and flutes connected with the mysteries and concealed from the uninitiated. These houses are often used for the worship of ancestors.[9]

(*e*) *The house-shrine as temple.*—Still another aspect of the primitive temple, sometimes suggesting a point of departure for more exclusive temple structures, is the hut or house a corner of which is set apart as a place or shrine for an image or sacred objects. This custom is well-nigh universal, and only a few examples need be noted.

Among the Banyankole in each hut is a special place for fetishes, consisting of a mound of earth a foot high, beaten hard, with grass laid upon it.[10] With Gold Coast tribes the *suhman* containing a spirit has an honoured place in a corner of the hut, where offerings are made to it, or, as with the Yoruba, the house-god Olarosa, represented in human form, is set up at the door, and huts have a recess in the wall for the fetish.[11] Here and there in Melanesia and Papua images of ancestors are kept in houses, or, as in certain islands off the western end of New Guinea, in a separate room of the house in which miniature wooden houses are placed for the souls to reside in. Offerings are made to them. In the chief's house are shrines for the souls of all who have died in the community. 'Such a house might almost be described as a temple of the dead.'[12] Among the Klemantans images are kept in the hut, or, as also with the Kayans, stand before them.[1] The Votiaks set their *vorsud*, or clan-god, on a shelf in the out-house.[2] In higher religions the household shrine is well known. Most Buddhist houses have their shelf with an image of Gautama. Shintōists treasure objects of private cult on a house-altar. In ancient Egypt each house had its domestic shrine, usually a recess or a cupboard with the figure of a household god.

In certain regions the temple seems to have arisen out of the private sanctuary of the king. In Mycenæ houses, especially the king's palace, had chapels as part of the structure, and the palace later became the temple. With the Phœnicians the temple was at first an annexe of the palace, like Solomon's temple at Jerusalem. Where a cult of the hearth-divinities, with libations thrown into the fire, existed—*e.g.*, in Roman houses—the house itself was a temple with the hearth as altar.

2. **Actual temples in the lower culture.**—We have seen that, while in many savage religions actual temples are unknown, many approaches to temples exist. Yet even savages are not devoid of temples of a primitive kind, for it was natural to suppose that, as the worshipper had a house, the god or spirit also should have one, either as the permanent shelter of his image or as the place whither he might resort and be approached by men in worship.

(*a*) The most primitive temples are probably those found in Africa, both Negro and Bantu. While frequently the 'place of praying' is a mere clearing under the tree in the village courtyard,[3] thus conforming to what was found in early Indo-European worship, sometimes an actual hut is provided for a god, not differing much from the ordinary hut.

On the Lower Niger the temples contain images standing on mud platforms, and the *ju-ju* house in the bush is secret to all but the priests, and contains images, while the walls are decorated with plates.[4] Similar temples exist among the Ewe, and that of the rain-god is painted with the colours of the rainbow.[5] The celebrated serpent-temple at Whydah was merely a circular hut, thatched with grass—a privilege allowed only to shrines and temples—standing in an oblong enclosure. In it the sacred snakes were kept.[6] In Dahomey temples are circular huts, so low that a man must bend double to enter one. Images stand in them on a platform of clay, before which are earthen pots and vessels smeared with blood, eggs, and oil. Some temples are elaborately decorated, and they as well as sacred groves are distinguished by calico streamers fluttering from poles or trees.[7] Among the Yoruba—*e.g.*, at Benin—the *ju-ju* temple consisted of a space of ground 150 yards by 60, surrounded by a high wall, and covered with short grass. At one end a long shed extended across the breadth, and under it stood the altar, made of three steps the whole length of the shed. This was slightly raised in the centre, and on it stood ivory tusks on bronze heads. In the centre of the enclosure were a kind of candelabra with hooks, and a well for the reception of the bodies of victims.[8] Among the Baganda temples resembled the king's house. They were conical structures with an elaborate reed thatch coming nearly to the ground, and supported on posts, with hide curtains for the doorway. They had also a sort of pinnacle composed of layers of reeds bound together and fastened to the top of the roof. The floor was strewn with a carpet of scented grass, dried, and cut to uniform length. These temples took some time to build, and their structure was frequently renewed. Some had also a court surrounding them, and in the case of the more important gods only the priests and mediums could enter it. In others the temple attendants had their huts in the court. Temples without courtyards could be approached and even entered by the people. The temple of the god of war was surrounded on three sides by a thick forest sacred to him. Each temple had its priests and mediums who lived in huts near by, where their vestments, worn on entering the temple, were kept. Young girls tended the sacred fire always burning in the temples, save in those which might not be entered by a woman. The larger temples had estates attached to them for their upkeep. Temples of gods had no images, for images were unknown, but they had a dais on which the invisible deity was supposed to sit, or on which his relics were kept. Sacred drums were stored in certain temples. Fetishes had also temples with priests and mediums, and there were special temples for the king's jaw-bone and umbilical cord,

and others for his ghost.[1] Similar temples for divinities and for the royal jaw-bone existed among the Busoga, Banyoro, etc., but with these and the Baganda the creator-god had no temple.[2]

(*b*) In Melanesia temples are not common, but in the Admiralty Islands wooden, thatched huts of a beehive shape, with carved door-posts representing male and female figures, serve as temples. The doorway is closed by a hurdle. Skulls of pigs and turtles are attached to the rafters, as well as balls of human hair. A mystery was always made about the principal temple, which contained images, and was sometimes open, sometimes closed.[3] In Fiji each village had one or more temples (*bure*), built on a mound faced with stone rubble-work. The roof was high-pitched, with a projecting ridge-pole, and the height of the structure was twice its breadth. Each *bure* had two doors and a fire-place, and contained images, jars, boxes, mats, etc. From the roof hung a long piece of bark cloth reaching to the floor at one of the corner-posts, and marking the holy place which none but the priest approached to be inspired by the god, who descended by this cloth. The dead were sometimes buried in the *bure*, but the building was only used for worship on special occasions and often became ruinous in the interval. It served also as a council-house and chiefs' club-house. *Bures* were also erected in memory of the dead, and had an altar for offerings.[4] In the district of Tumleo, New Guinea, *paraks*, or temples, built of wood and standing on piles, are found. They consist of two storeys and have high gables, and are approached by ladders with hand-rails carved in the form of crocodiles and ape-like figures. Nothing but drums and flutes is found in the *paraks*, and these, played by men, signify the presence of the spirits, for whose worship the temples exist. A certain degree of mystery attaches to the *paraks*; no woman or child may enter them or loiter in their vicinity.[5]

(*c*) In certain parts of Polynesia—Society and Sandwich Islands—the temples, or *marœ*, were enclosures open to the sky and they were of three classes: national, local, and domestic.

The national temples, called *tabu-tabu-a-tea*, perhaps because of their wide-spread sacredness, were depositories of the chief images and the places where great festivals were held. Each of them was composed of several *marœ*, some with inner courts for the images, altars, and sacred dormitories for the chief divinities, all enclosed by stone walls on two sides. In front was a fence, and at the back a pyramidal structure often of large size, with images and altars before it. At Atchura this structure was 270 ft. long, 94 broad, and 70 high. Steps led to the top, which had a surface area of 180 by 6 ft. Within the enclosure were the priests' houses, and trees grew both within and around it, forming a dark grove. Offerings were placed in the *marœ*. Men alone usually took part in the festivals, but on the completion of the year women and children also attended, but were not allowed to enter the sacred enclosure. Local *marœ* were those belonging to the different districts; the domestic *marœ* were for the family gods. In both of these, as well as in the royal *marœ*, the dead were deposited, and were there under the guardianship of the gods.[6] In other districts —*e.g.*, Samoa—temples resembled the beehive thatched huts, or, again, the village house where the chiefs met served as a temple. In some cases groves as well as temples were used as places of sacrifice.[7]

(*d*) Among the coast Veddas temple structures exist. One is 12 ft. by 10, roofed, and facing eastwards, with the roof carried forward beyond the front wall and door. Outside this structure are a long pole, a well, and a tree with a platform, and just outside the door stands an altar. The interior is decorated with cloths and branches on the occasion of a ceremonial dance, and ceremonial garments are kept within it. Some of the village Veddas have temples of bark or of mud resembling their own huts. In these the shaman dances, and symbols of the spirits are kept.[1]

(*e*) With the Todas, worshippers of the sacred buffalo, the dairy forms the temple or sacred place, with its ceremonial vessels and other things, which are preserved there; and precautions are taken to prevent their contamination by the touch or look of unauthorized persons. Relics of heroes are also stored in them. These temple-dairies have usually two rooms, and are of the same form as the native huts.[2]

(*f*) As an example of various stages in the evolution of temples from simple to highly elaborate, over a large area, we may cite those known in N. and S. America. Most of the lower tribes, and some of the more advanced (Hurons, Iroquois[3]), had no temples. But usually there were sacred spots or shrines where ceremonies were performed, sacrifices offered, and images set up.[4]

Among the Hopi such places were called *pahoki*, 'prayer-house,' and often had nothing to mark them but prayer-sticks —sticks with feathers attached. Others were denoted by circles of stones—*e.g.*, the sun shrine with an opening to the direction of sunrise at the summer solstice—by a single stone, or by some natural mark on a rock.[5] To these correspond the sites on which are erected bowers or lodges for the public performances of mystery societies in other tribes, often containing an altar with sacred objects.[6] More elaborate shrines also exist among the Hopis and will be described later. In S. America corresponding to such shrines is the secret spot where the *botuto*, or sacred trumpet, of the Orinoco tribes is kept, so that women and children may not see it. With other tribes the insignia of a *piai* are tabu and are kept in a special shed or hut, which is also used as a place where he may be consulted. It is called a 'spirit-house' and is tabu.[7] Here also may be mentioned the special 'medicine-lodge' of many tribes, erected for the performances of the shaman, corresponding to that found among the Ural-Altaic tribes of N. Asia.[8]

With other tribes—*e.g.*, the Omaha—the sacred structure consisted of three sacred tents, or *tipis*, which were carried from place to place, like the Hebrew 'tent of meeting.' They consisted of poles tied together at the top, arranged in a circle, and covered with bison skins. They sheltered the three sacred objects—the sacred pole, the sacred buffalo-cow skin, and the sacred bag.[9] The household tent as a shrine containing an altar is also sporadically found—*e.g.*, among the Siksika, with whom each tent has an altar, a mere hole in the ground, in which sweet gum is burned.[10]

With the Apaches, Sioux, and others, sacred caves took the place of temples, where religious rites (tabu to women) were performed, or which were used as resorts for prayer.[11] In Florida the Apallachians had a cave-temple on the sun-mountain, Olaimi, 200 ft. long, and containing an altar and images. Images also stood at the entrance, which faced eastwards, so that the earliest beams of the sun fell upon it.[12] More elaborate still was a cave-temple of the Wiyataos, which had been used to celebrate rites by the followers of a culture-hero Wixipecocha, but was later turned into a structure with galleries, halls, and apartments. Into it the priests descended to perform sacrifices and ceremonies hid from the vulgar eye.[13]

Among the Chibchas the temples, each of which was dedicated to a god, were mere huts with clay walls, containing small stools on which idols were set. The floor was covered with grass, and mats hung on the walls. Those of greater importance had the distinction of having their chief posts set on the body of a sacrificed slave. Small shrines also existed

throughout this region, on hills or by lakes.[1] Among some Californian tribes structural temples, or *vanquechs*, in honour of the god Chinigchinich, consisted of an oval enclosure, four or five yards in circumference, with interior divisions formed by branches, stakes of wood, and mats, and containing a hurdle supporting an image.[2] The temples of the Natchez, one in each village, which stood on mounds, were huts about 30 ft. square and of a somewhat elaborate structure. They contained the sacred fire as well as a division in which sacred objects were kept. On a platform rested the remains of the 'sun-chiefs,' with sacred images, and in an innermost sanctuary was the holy image of the sun-god or hero. This temple was the object of great reverence.[3] Such sun-temples existed over a wide region in Florida, Arkansas, and Virginia, and were no more than large wigwams with thick mud walls and a dome-shaped roof with figures of eagles. Images stood in them, and women were excluded from them.[4] No more elaborate were the temples described by travellers among Virginian tribes, in the Mississippi region, among the Fox Indians, or in S. America with the Tupinambas.[5] Among the Huichols are temples (*tokpia*), 'god-houses,' and sacred caves, though the difference between the first two is not clear. The temples are larger than but otherwise resemble the houses, which are circular, stone-built, and roofed with thatch, and which possess a low entrance to the east. The roof is supported by upright beams. In the centre is a fireplace—a circular basin of clay. Niches in the interior walls contain ceremonial objects, and each of them is devoted to a god, and in charge of an officer of the temple. Flowers are offered with prayer in these niches. In front of the temple is a square open space for the 'god-houses,' in which the officers live who watch the temple. They are rectangular, of stone and mud, with a thatched gable-roof. The interior contains symbolic objects to please the gods. The people meet in the temples for shamanistic ceremonies. Chairs are placed for the deities invisibly present. Images are kept in sacred caves in the mountains, sometimes set in miniature temples there.[6] In the Pueblo region the more elaborate shrines were of the nature of temples. They consisted of sealed stone enclosures, sometimes with symbols painted on them, and they contained images and symbolic representations of supernatural beings. Among the Hopi the shrine of the earth-goddess is a sealed chamber in which is her image, seated. Every November at the 'new fire' ceremony a slab is removed, and offerings are placed in the shrine, while every four years the image is carried in procession. In all Pueblo shrines are placed permanent objects (images, stones, carved slabs, etc.) and temporary objects (prayer-meal, pollen, sticks, bowls of water, clay images).[7]

The council-house, men's house, the *kiva*, etc., as serving *inter alia* all the purposes of a temple, have been already referred to.[8] In the case of a *kiva*, or lodge of a mystery society, this is particularly marked. None but priests or the initiated may enter the sacred place; in it are made the sacred objects used in the ritual; and here prayers are said, smoke offerings presented, and other ceremonies—*e.g.*, purificatory rites—are carried on.

The rude stone structures just described form a primitive aspect of the more elaborate stone temples of barbaric peoples in N. and S. America. It was also natural that, where wooden temples existed, they should be replaced by temples of stone, as soon as more elaborate architectural methods were attained. Intermediate stages between these simple structures and the massive and elaborate temples—the ruins of which still command respect—are seldom met with, but Peter Martyr describes one in Hayti, and Schoolcraft another at Cayambe—a circle of sunburnt bricks 48 ft. in diameter and 13½ ft. high, with a small door, open to the sky.[9] Probably many of the Peruvian temples were of such a simple character, and even the great temple of the sun at Cuzco, comprising many buildings and apartments, though it was richly adorned with gold plates, cornices, and studs, and was provided with gardens and fields, had no great architectural character—mere squares and parallelograms of one storey, roofless or thatched.[10] Previous to the Inca rule, the temple was strictly a lofty altar with a chapel for the image. Under the Incas the chapel increased in size, encircling the altar, and was made elaborate by the addition of other buildings.[1] Certain remains of temples in Peru, however, show a greater architectural complexity than those described by early Spanish travellers.

The Mexican temples, *teocalli*, 'abode of the gods,' may be described as gigantic altars on which stood chapels for the images. There were many temples in each city, varying much in dignity.

The larger *teocalli* had a great outer court capable of holding a crowd of people. Within this space stood priests' houses, oratories, and chapels for lesser gods. There arose from it a pyramidal structure of earth faced with brick or stone, rising in stages, three to nine in number, each with a platform, to a height of 80 to 100 feet. Stairways, differently arranged, rose from the base to each platform, and thence to the top. Sometimes the stairway rose directly from base to summit up one of the faces of the pyramid; or it ascended at one of the angles to the first platform, at another angle to the second, and so to the top, in order that a religious procession in ascending might make a circuit of the structure. The platforms had palisades on which were stuck the heads of human victims. On the summit stood a tower or chapel, or sometimes two, containing the image of the god or gods to whom the temple was dedicated. In front of them stood the great stone of sacrifice and altars on which perpetual fire burned. The great procession of priests at the numerous religious services was visible to all who directed their eyes to the *teocalli*, as it made the ascent.[2]

The practice of placing temples on pyramidal structures is also found among the Mayans and throughout the whole area of Central America, but here the buildings were of a more ambitious kind, with elaborate architecture and sculpture.[3]

The mounds of the Mississippi region were thought to be of Mexican or Mayan origin, but it is now accepted that they were the work of Indian tribes—Cherokees, Shawnees, Delawares, Choctaws. Nor is it proved that every mound was crowned by a temple or altar. 'Whether these were sacred enclosures, sacrificial and temple mounds, are questions to be settled, if possible, by investigation and legitimate deductions.' Houses were built on some of the mounds, but occasionally travellers speak of a temple on a mound. In such a case the mound was of no great height, and the temple was a simple structure like that of the Natchez.[4]

3. Miniature temples.—Among many African tribes there is a custom of making a small hut for the spirits, about 2 ft. high. This stands in the village or outside, and offerings are made at it. It is supposed to contain 'an uncanny something,' and is a kind of temple of the dead, whose spirits are supposed to visit it.

In Uganda the hut is a veritable sanctuary, with a sort of altar for offerings.[5] In New Guinea some of the tribes set up little houses in the forest for the use of ancestral spirits, or place these within inner rooms of their own dwellings; others place the skull of the dead man in such a hut in the forest.[6] Similar miniature structures for ancestral ghosts are found in Indo-China and among the Gilyaks.[7]

4. Temples in the higher culture.—In higher civilizations the temple usually has a prominent place in religious life, and is architecturally of great importance. But here also it was evolved from simple structures, though these as well as the intermediate stages cannot always be traced in archæological sequence or from historical evidence. The series of articles on ARCHITECTURE deal with the structure of such temples in the greater religions, and it is unnecessary here to do more than offer a few general remarks.

(*a*) The great temples of ancient Egypt were preceded in pre-historic times by a simple structure of dried mud or a hut of wicker-work, not differing much from human dwellings and probably

resembling African native temples. The hut was sometimes square, sometimes domed, and stood on a platform of earth to save it from inundation. Within it was the image of the god, and the only opening for light was the doorway or portico, with a mast at each side. In front was a court fenced with a palisade.

The hut gave place to a stone building, but, when additional rooms were built round the central 'house of the god,' and when the whole structure of the temple, with its spacious sphinx-guarded approach, pylons, courts for the worshippers, pillared halls for processions of priests, etc., was elaborated, the dark central chamber of the god, accessible to the higher priesthood only, remained as a constant factor, and contained the divine image or the sacred animal. The door was solemnly sealed with papyrus and clay at night, and as solemnly opened in the morning, before the day's ceremonial began. Thus what had once been the temple itself was now the inner sanctuary of a wide-spread temple, with all its multifarious buildings and chambers for purposes connected with the cult. The height of the Egyptian temple diminished from front to back.[1]

(*b*) The great temples of Babylon had probably originated in a structure of simple kind, oblong in shape, with a recess for an image. Excavations show that the great temples stood in a court with a vestibule, flanked by chambers.

The temple building consisted of a long outer hall, opening into a smaller one with the holy place, or *parakhu*, where stood the image of the divinity and an altar. The holy place was open to the priests alone, or to a worshipper accompanied by a priest for special religious purposes. An altar stood in the court and perhaps in the outer hall also. The names of temples are many, and some of them show their great sanctity, others are suggestive of height—'the house of the shining mountain,' 'the lofty house.' This points to the high tower-like structure, the *ziqqurat*, which stood beyond the important temples, or towered within the sacred enclosure where stood many temples dedicated to various gods, as well as the houses of priests—a grouping of religious buildings found in the larger cities. The *ziqqurat* was a storeyed tower or pyramid, consisting of a series of diminishing and superimposed cubes. These varied in number, and symbolized the mythical mountain of the world. Where it consisted of seven storeys, these represented the planetary zones, or the seven zones of the earth. Each storey was approached by an inclined pathway or a flight of steps, either directly up the face or diagonally across it, until the top, which formed a broad platform, was reached. On the platform stood a chamber for the god, containing a couch and throne, and perhaps an image. As with the Mexican *teocalli*, processions winding up the tower could be plainly seen below, and, while the Egyptian temple in its grandest development was spread over a large area, the Babylonian, as far as the *ziqqurat* was concerned, aimed at reaching a lofty elevation, and represented in miniature the structure of the universe. It seems to have been regarded also as the grave of the god to whom it was dedicated, and persons of importance were sometimes buried round it.[2]

Both Egyptian and Babylonian temples were endowed with lands which yielded large revenues. Hence, outside their religious purpose, they had great influence on the economic life of the nation. In the Babylonian temple area also, as the priests were administrators of the law, there were courts of justice, chambers where national archives were stored, and even banks.

(*c*) The Greek temple was preceded by the τέμενος, the open sacred place with its ἄγαλμα of the deity, altar, and other *sacra*. In the Ægean religion the sacred cave served as a temple where the Mother-goddess was worshipped, as in the double cave (upper and lower) of Dicte in Crete, where a rich store of cult objects has been found in recent years.[3] Palaces had their domestic chapel or shrine, plain and of small size, with a ledge at one end for images and sacred objects. The ruler was a priest-king, and in one instance, that of the palace of Knossos, 'the Place of the Double Axe' (λάβρυς), the whole building has the character of a temple.[4] Free-standing shrines or temples also existed, like that discovered at Gournia, a small enclosure 12 ft. square, in the heart of the town, in which were found many images and cult objects.[1] With the perfecting of the divine image, a house to shelter it became necessary, and the earliest type was no more than a rectangular oblong *cella*, or σηκός. To this was soon added an additional chamber, with open front and a couple of columns supporting an architrave, the corners of which rested on flattened columns attached to the ends of the side walls. These columns were at first of wood; the earliest stone columns date from the 6th cent. B.C. Throughout the whole period of Greek religion the rectangular *cella* remained as the central part of all Greek temples, though it was sometimes prolonged back and front with additional chambers, or surrounded by single or double rows of columns, while these were sometimes also introduced within the *cella*. Vitruvius, indeed, classifies temples according to the arrangement of the columns in relation to the *cella*.[2] The temples of the gods faced eastwards, and opposite the entrance stood the image of the god. The *cella* also contained an altar or altars, votive offerings, and treasure, the last being also stored in the chamber behind the *cella*. The temples were never large; they were merely houses for the image, and hence were often kept closed. They were decorated with sculpture and painting both within and without. The temple stood within a τέμενος, where the great altar was placed, and where the worship was carried on.[3]

(*d*) The Roman *templum*, as already shown, was originally a rectangular space of ground marked off by the augur, in which a tent was pitched for augural purposes, like the 'medicine-hut' of the shaman. Strictly speaking, the house of a god was the *ædes*, but the word *templum* was now applied to such a structure, inaugurated by the augurs, and usually of larger and more complicated structure than the *ædes*. In the earliest times divine dwellings were unknown. The grove, the cave, the hearth, were the earlier sacred places, or the *sacellum*, a small place consecrated to a god, enclosed by a fence or wall, but roofless, with an altar and possibly an image. The Romans, in erecting houses for the gods, were influenced by the Etruscans and the Greeks. The Etruscan temples were of wood, oblong, with one or more chambers and an open portico. The Roman temple had also a central *cella*, but of much greater breadth than the Greek, this feature being probably a result of Etruscan influence. The structure of temples, whether simple or elaborate, was generally determined by Greek architecture, though there were differences in detail—*e.g.*, the absence of columns at the back. Circular temples were also built; these had become common in Greece from the 4th cent. B.C., though it is not impossible that the form may be copied from the early Italian house.

Before building a temple, a space of ground was *liberatus et effatus* by the augurs, and consecrated by the *pontifex*. When the building was erected, it was dedicated to a god. In some instances, however, a building might be consecrated to religious use without the preliminary augural ceremony. Such buildings were *sacra*, or *ædes sacra*, like the temple of Vesta.[4] Outside the temple stood the altar, and within burned the sacred fire. In the temples were stored votive offerings, gifts, treasure of all lands, as well as the images of the gods.

(*e*) During the Vedic period in India, as has been seen, there were no temples. No trace of temples in the pre-Buddhist period is known, but, if any existed, they must have been of wood, as they still are in Burma, the use of stone in

architecture not having been introduced until Aśoka's reign, as a result of contact with the West. Religious edifices are certainly known for the first time in Buddhism. The primitive sacred object in Buddhism was not an image, but a relic. This at first was not set in a temple, but enclosed in a *stūpa*, or *tope* (Siṅhalese *dāgaba*) —an elongated hemispherical structure standing on a base, the exterior often richly carved or ornamented, and crowned with a square capital and the *chhattra*, or umbrella. Many *stūpas* contained no relic, but were erected as commemorative objects. A path fenced by a railing surrounded the *stūpa*, for circumambulation. The *stūpa* was decorated with flags, streamers, and flowers; and it was the chief religious edifice of early Buddhism.[1] Another religious edifice was the *chaitya*, a name applied to any religious monument—*e.g.*, a *stūpa* with relics—but also restricted to a building corresponding to a temple or church, the '*chaitya* hall,' with pillared aisles and an apse containing a *stūpa* and an altar.

The earliest known structural building of this type—*e.g.*, at Ter, Haidarābād—consists of an apsidal chamber with high barrel-vaulted roof. In front is a square hall, or *mandapa*—perhaps a later addition, lower in height, with a flat roof supported by pillars. The façade above the roof of the hall has a niche containing now a Hindu image, which was probably at one time a window. Within the apse stood a *dāgaba*, now replaced by a Vaiṣṇava image. *Chaitya*s of this type must have been common in India. Buddhism made use of rock excavations at an early time for *chaitya* halls, which sometimes had aisles.[2]

A third structure was the *vihāra*—a hall where the monks assembled, with cells at the sides for sleeping. The *vihāras* were later used as temples and became the centre of monastic buildings grouped around them. They usually stood beside *chaitya*s, though they came to be furnished with chapels in which religious services could be performed as well as in the *chaitya*.

During ten centuries from Aśoka's time onwards cave *chaitya* halls and *vihāras* were excavated all over India.

In early examples at Bihār the *chaitya* halls are merely oblong chambers, sometimes with a cell or apse at the farther end for the *dāgaba* with its relic. Others are more elaborate. The façade of the cave represents the exterior of a wooden *chaitya* in all its details. The interior is apsidal. Pillars are cut in the sides, and in the apse is the *dāgaba*, which now has the image of Buddha in front of it. Some of these caves are highly elaborate in their carving both within and without, and are also pillared structures with aisles. The cave *vihāras* have a central pillared hall with cells at the sides for monks. Beyond the hall are one or more inner sanctuaries for images of Buddha. These are later additions. Here again the architecture and adornment varies from simple to highly elaborate. The earliest free-standing *vihāras* were probably simple halls with cells attached, and were sometimes of a storeyed pyramidal form, each successive storey decreasing in size, and giving a series of pillared halls one above the other, with cells for the monks on the terraces. This architectural structure supplied a form for all the later temples of southern Hinduism.[3] Attached to great monasteries, as at Peshawār, was a court, or *vihāra*, with cells for images, and beyond that, opening from it, a circular or square court surrounded by similar cells, and with a *stūpa* in the centre. These belong to the period of Mahāyāna Buddhism.

One of the earliest known temples, or *chaitya*s, is at Bodh Gayā, in front of the Bo-tree of Buddha's enlightenment. Frequently restored, it was probably erected in the 6th cent., and is 160 ft. high by 60 ft. wide. It is rectangular with an elongated pyramidal form of nine storeys, each with exterior niches for images, and the interior *cella* contained originally an image of Buddha. Such a nine-storeyed tower-temple is unique in India, but is found frequently north of the Himālaya.[4]

Hindu temples doubtless owe much in their inception to Buddhism, and are of great variety in structure, size, and ornamentation. But there are two principal groups, one in Southern India of the so-called Dravidian style, and one in Northern India, each of which shows great uniformity in general plan. In S. India the structure consists of the temple proper, or *vīmana*, 'the vehicle of the gods'—a square building with a pyramidal roof which may have one or several storeys, like the storeyed *vihāra* of Buddhism. In this is the square cell containing the chief image of the god, and lit only from the doorway. Between the wall of the inner cell and the outer wall is the procession path, or *pradakṣina*. Pillared porches or halls called *mantapams* (Skr. *mandapa*) precede the entrance, and are usually larger than the *vīmana*. *Vīmana* and *mantapam* stand in a walled enclosure with gate-pyramids, or *gopurams*, corresponding to the Egyptian pylons and often very imposing. Within the enclosure stand a pillared hall, priests' dwellings, tanks, and other structures. These temples are devoted to the Vaiṣnava and Śaiva cults, and are not otherwise distinguishable apart from the sculptures and images. The earliest examples of the *vimana* show its derivation from the Buddhist apsidal *chaitya* hall. The apse for the relic-shrine has become a cell for an image and is entered by a door. In another early example the circular apse has given place to a cell with altar and image, surmounted by a tower, and the hall in front, distinct from the cell, is pillared. Cell and pillared nave or *mantapam* are reproduced in all Jain and Hindu temples of later date, together with the storeyed tower. The enormous size and elaborate architectural and sculptural design of these buildings make them still marvellous rivals of the cathedrals of Europe. Some, besides the original enclosure with its gate-pyramids, have a second or even third exterior enclosure, with *gopurams*, shrines, porches, cells, etc. The *vīmana* in itself corresponds to the ordinary Hindu village temple, and in some examples has either been such a temple or is little more imposing than one of these. Sometimes two *vimanas* dedicated to different divinities stand within the central enclosure. In S. India the largest group or congeries of temple buildings is at Śrīraṅgam. There are seven enclosures, leading gradually to the central shrine, and the three surrounding the central enclosure are crowded with temples, porches, halls, etc., while in each wall there are two or three *gopurams* of great height. 'The idea is that each investing square of walls . . . shall conduct the worshipper by regular gradations to a central holy of holies.'[1] While the temples of this kind are of comparatively late date, others of earlier date, but presenting the same general features, have been carved out of the solid rock and excavated internally, so that they are monolithic temples. The chief examples are the raths (*ratha*=*vīmana*) at Mamallapuram and the beautiful *kailāsa* at Ellora.[2]

The Northern temples (Fergusson's 'Indo-Aryan style')—*e.g.*, in Orissa—are characterized by a pyramidal curvilinear tower on a polygonal base in which is the central shrine, often quite small. The interior plan is square, and in the Orissan examples there are no pillars, or these are found only in modern additions. In front is a square porch with pyramidal roof, and sometimes in front of this again additional porches. The enclosing wall is always insignificant, if it is present at all, and has no *gopurams*. Other shrines are always subordinate to the towering temple proper with its porch. Even the more elaborate temples preserve these essential features—*e.g.*, the Kandarya Mahadeva, or temple of Śiva, at Khajurāho.

In all Hindu temples the inner cell or shrine with its image is the central feature round which all the other parts are grouped, and to which, however elaborate, they are all subordinate. The cell is cubical, of small dimensions, unornamented,

and unlit save by the doorway, and is too sacred to be entered by any but the priests. The exterior building surrounding the cell is of the most elaborate workmanship, often of a kind which offers little clue to the method of producing it. In some districts enormous numbers of temples exist, ancient and modern, and at Benares, the sacred city, there are 1500, though none are older than the 18th century.

(*f*) In Nepāl the *stūpas* do not contain relics. Some are of flattened hemispherical shape with a square capital, 'umbrella,' and lofty finial or spire, like those in Tibet and China, and stand on a plinth on which are built shrines of the five Dhyanibuddhas. Others are lower and flatter; and others again stand on a structure with successive roofs. Buddhism in Nepāl is mingled with Saivism, and the characteristic temple is a square structure of several decreasing storeys divided by sloping roofs. Some are mounted on a pyramidal-stepped platform. These buildings are of wood and stone.[1]

(*g*) In Burma the *stūpa* (*tsedi*) is bell-shaped and stands on a series of platforms, and is crowned with a conical finial. The temples are of square form with projecting porches. In the thickness of the walls are narrow corridors with niches in which are images. A series of storeys arranged pyramidally and crowned with a slender steeple forms the roof. Ancient Buddhist temples in Siam have a rectangular outer enclosing wall, within which is the *bot*, also rectangular, with a porch. The interior is divided by pillars into a nave and single or double side aisles. Within are the high altar and image of Buddha. Behind the *bot* stands a *stūpa*, or *phra*. *Vihāras*, or *vihāns*, and *kamburiens* are buildings similar to the *bot*, but smaller, where the laity come to pray or hear sermons. The *bot* is accessible only to the priests. The *mondob* is a rectangular building enclosing a huge image of Buddha. One enclosure sometimes contains several of these structures, erected from time to time by devout Buddhists.[2]

(*h*) The earliest Chinese religion had no temples, and apparently the general use of these is due to Buddhism. With few exceptions the temples of the three religions, Confucianism, Buddhism, and Taoism, are mainly of one type, though they differ in size. The religion to which each is dedicated can be discovered only from their interior decorations and the images which they enshrine.

Buddhist temples are enclosed by a wall with an ornamental gateway. The temple has a series of porches or halls, opening from each other. Two of these form antechapels to the main structure with its altar and images of the three Buddhas, facing the entrance, and stalls for the monks. Before the images stands the table for offerings, with lamps and flower-vases. Beyond this another hall contains a *dāgaba*, and a final one enshrines the image of Kwan-yin. Within the enclosure are the various buildings for monks, pagodas, drum-tower, bell-tower, and other structures. The roof has the characteristic form of all Chinese buildings, concave, with projecting eaves, but more elaborately decorated than in secular buildings. Confucian temples are of the same general plan, the central 'Hall of Great Perfection' containing the tablets of Confucius, his disciples, and the twelve sages. Tables for offerings stand before these. Taoist temples contain the images of the Three Precious Ones, in imitation of the three images of Buddhist temples.

(*i*) In Japan, as in China, the earlier worship was in a consecrated enclosure open to the sky. Tradition assigns the first temples to a period near the beginning of the Christian era. Shintō temples are not large and conform in structure to the architecture of an age when tools were few and primitive. The quality of the wood used in the structure is of more importance than ornamentation and carving, whereas the carvings on Buddhist temples are highly elaborate, and have much gilding, lacquer-work, and painting. The oldest Shintō temples and many of the smaller ones are thatched. The type is similar to that of China, showing that Chinese influences prevailed.

The temple area, at least in the case of the greater temples, has several enclosures, with fences and gateways preceded by flights of steps. The grouping of the various structures differs according to the nature of the ground, usually on a slope, giving the chief eminence to the main shrine. Shintō temples, but rarely Buddhist, are preceded by the characteristic *tori-wi*, of two wooden uprights with cross-bars, the upper one projecting and curving upwards at the ends; they correspond to the gateways of *stūpas* and temples in India, like that of the *tope* at Sanchi, and to similar structures in religious architecture elsewhere.[1] The temple consists of two or three halls, one an oratory or prayer-hall for worshippers, an intervening hall, and the sanctuary open only to the priests. Shintō temples have no images, a mirror usually constituting the symbol of deity. Some temples are dedicated to more than one divinity. An altar stands in the shrine. The lay-worshipper, entering the prayer-hall, pulls a rope attached to a gong and so announces his presence to the deity before beginning his devotions. Within the temple enclosure, as in China, the grounds often being laid out artistically, stand a pagoda, drum-tower, belfry, stage for religious dances, library, votive-offering hall, store-houses, kitchen, priests' rooms, etc. This general description applies to both Shintō and Buddhist temples, though the latter are generally more gorgeous and imposing, and contain images, lights, votive offerings, lotus-flowers of silver-gilt, while the priestly ritual is elaborate. They are usually built of wood, with gilding and porcelain casing, and metal work; the roofs are of tiles.

(*j*) In Tibet the Buddhist monasteries are the chief architectural structures, occupying large areas and containing a square for assemblies, in which stands the temple.

This is a stone rectangular building, on the top of which is a pavilion with a roof of Chinese type. The interior is divided into a nave and side aisles by pillars, which are painted in yellow and red. The three great Buddhist images with their altar stand at one end. Other images stand along the side walls. There are no windows, and the interior, which is richly coloured or decorated with frescoes and hung with banners, is lit by lamps. Seats for the various officials and Lāmaist congregation are arranged according to a definite order. The temple is approached by a flight of steps and a gateway guarded by demoniac figures. In the vestibule are images of the kings of the four quarters, and also prayer-wheels. These, in larger temples, are placed in detached chapels, in which are images of lower divinities. Occasionally, as at Gyan-tse, a temple is built in stepped terraces, like a *vimana*, crowned by a drum-like structure, on which are a square and a *chhattra* canopy. Shrines to the different Buddhas occupy the various storeys.[2] The great 'cathedral' at Lhasa faces eastward, and is three-storeyed, the roof being of gold. The approach is through a pillared hall, adorned with pictures. Beyond this is an antecourt, leading to a pillared hall, shaped like a basilica and divided into aisles by a series of colonnades. It is lit from above, as there are no side windows. On the side walls are chapels. Lattice-work separates the cross aisles from the longer aisles, and on the west the sacred place is approached by a staircase. This is in form of a square, with six side chapels, three on each side. An altar stands in the centre, and on the west is a recess with an image of Buddha. Here too are the seats of the Dalai and Tashi Lāmas, and of abbots and lesser officials, as well as images, relics, prayer-wheels, etc.[3]

(*k*) The Hebrews had different kinds of sanctuaries before the Temple was built at Jerusalem. The 'tent of meeting' referred to in E was pitched outside the camp in the wilderness. There Moses communed with God, who appeared in a pillar of cloud (Ex $33^{7ff.}$, Nu $11^{24ff.}$ 12^{5} 14^{10}). It is not described, and was obviously of a simple character. Its one guardian was Joshua, who 'departed not out of the tent' (Ex 33^{11}). The tent may have contained the sacred Ark, a kind of abode of deity, as Nu 7^{89} shows (cf. 2 S 15^{25}), though tent and Ark are never mentioned together. Such portable sanctuaries were used by the Semites, either in nomadic or in more settled times, in the latter case certainly in connexion with war, when the images were carried with the army. The Hebrew 'tent' was used for sacred divination like the Semitic portable sanctuary, and it may be compared with the sacred tents of the Omaha.[4] The Tabernacle, elaborately

described by P, and containing the Ark, was probably never more than an ideal priestly construction projected upon the past. The Ark was later kept in a 'house' or temple at Shiloh (1 S 1^9 $3^{3.15}$), which may have been destroyed by the Philistines, who carried off the Ark. On its recovery, it was kept from time to time in private houses, and possibly in a tent (2 S 7^6), as it was so kept later by David at Jerusalem (2 S 6^{17}; cf. 11^{11}). Tents were also used after the settlement in Canaan on the 'high places' (2 K 23^7, Ezk 16^{16}, 'sewn high places').

What the 'house' at Shiloh was like we have no means of knowing, but probably it was not elaborate. Micah's image and other religious objects were kept in an apartment of his house (Jg 17^5 18^{18}). When captured by the Danites, these were placed in a sanctuary at Laish. At Nob there was a sanctuary with its priesthood, containing an ephod and a table of holy bread (1 S 21).

Tent and high place were succeeded by the Temple built by Solomon. It stood within a great court as one of a series of buildings, including the palace, and was thus dominated by the latter, to some extent, though it was itself the chief building. It had its own 'court of the temple,' surrounded by a wall of stone and cedar.

The Temple was an oblong structure of stone, faced by a porch, in front of which stood two bronze pillars called Jachin and Boaz, like those in front of other Semitic temples. The structure, exclusive of the porch, which was of equal breadth with the Temple, was 60 cubits long, 20 broad, and 30 high. It was divided by a partition with doors into a Holy Place (*hēkāl*) and an Oracle, or Most Holy Place (*debîr*)—a square dark chamber 20 cubits in each direction, leaving a space of 10 cubits above it. The interior walls were lined with cedar, carved, and ornamented with gold, and the floor was of cypress. Between the walls of the structure and an outer wall, running round the sides and back to the height of 20 cubits, were three storeys of rooms for treasure and Temple ornaments. In the Temple wall, above these, there were latticed windows. The Oracle, or Most Holy Place, the *adytum*, was the dwelling of Jahweh, and contained the Ark with the cherubim. In the Holy Place stood the altar of shewbread, the altar of incense,[1] and ten candlesticks, five on each side. Outside the porch, which faced east, was the altar of burnt-offering, and near it a brazen sea supported by metal oxen, as well as ten smaller lavers on wheels. The people gathered for worship in the court, though it is called 'the priests' court.' The Holy Place was for the priests alone—a suggestive difference, appearing now for the first time.[2]

Thus the main features of the Temple were common with those of Syrian and Phœnician temples of the period—porch, outer chamber, and *adytum*—though some have suggested Egyptian influences in its construction.[3]

Ezekiel's ideal Temple has the same division of inner and outer sanctuaries and porch, but there are two courts, an inner one for the priests, an outer for the laity; and the sacred building was to be entirely dissociated from all secular buildings, and was also to be shut out from Jerusalem by the lands of the Zadokites.[4]

Zerubbabel's Temple of the restoration period had an outer court with walls and gates, and an inner court in which stood the altar of unhewn stones, and perhaps a laver. Into the inner court the laity appear to have had access for a time at least. The Temple itself had a Holy of Holies, but was unique among temples in possessing no representation or symbol of deity, the Ark having been lost. The presence of deity, however, was marked by the ritual of the Day of Atonement. The Holy of Holies was separated from the Holy Place by a curtain, and this chamber contained the table of shewbread, altar of incense, and the seven-branched candlestick. The Holy Place was entered by a curtain.

Herod's Temple, built about 20 B.C., was on a larger scale than any of its predecessors, but the general plan was the same.

A large outer court—'the court of the Gentiles'—was surrounded by porticoes or cloisters with marble pillars, built against the enclosing battlemented wall. Within the area, on a raised platform, was a second court surrounded by a terrace and an enclosing wall with nine gates, and with chambers and porticoes on its inner side. Within this none but Jews might enter. A wall across the breadth of this inner court divided it into two parts, the smaller of which was 'the court of the women.' The other part was open to male worshippers, and within its area stood the temple building, surrounded by a breastwork of stone enclosing the court of the priests. Within this court priests only could enter, except when a layman offered a sacrifice which required his presence. The Temple within this inner area was preceded by a lofty porch and gateway. This gave access to the *hēkāl*, or Holy Place, across the great door of which hung a curtain, and this again to the *debîr*, the Holy of Holies, across the entrance to which hung two curtains. Above these was an upper storey, and a side building of three storeys surrounded the Temple on three sides. In the *hēkāl*, which was open only to the priests, stood the table of shewbread, altar of incense, and seven-branched candlestick. The *debîr* was empty and quite dark, and was entered by the high-priest alone on the Day of Atonement. In front of the porch outside stood the altar of burnt-offering and the laver. The building was of white marble, and the eastern front and part of the walls were covered with gold.[1] The *debîr* was 20 cubits square; the *hēkāl* 40 cubits long, 20 broad, and 40 high. The porch was 100 cubits high, 100 broad, and 20 in depth, and extended on both sides beyond the Temple, with its side buildings, by some 15 cubits. Herod had raised many pagan temples throughout his dominions, and he erected this for the Jews in his capital partly as a matter of policy.

5. **Conclusion.**—A general survey of temples shows that the essential part is the *cella*, or chamber, for the image of the god, and that, whatever additions are made by way of increasing the splendour of the temple or as adjuncts to it, this remains constant, and is indeed its most important feature. It is the holy place, and is seldom if ever entered save by the priests. The temple at Eleusis forms an exception, for apparently there all was open to the worshippers. But generally worship takes place in the temple area or within the hall preceding the *cella*, which is very often dark and unlit by windows. The Jewish synagogue, the Muhammadan mosque, and the Christian church are not strictly temples, for they are not houses enclosing a divine image, but places of public prayer. Yet even in the mosque the recess, or *mihrāb*, indicating the direction of the *ka'bah*, towards which the worshipper prays, has a certain parallel to the *cella* with its image which the worshipper also faces. The great mosque at Mecca also contains the *ka'bah* with the sacred black stone, and the *ka'bah* is an old but reconstructed sanctuary within the mosque. In the Christian church the chancel and the sanctuary with the altar are not ordinarily open to the laity assembled in the nave, but yet they approach the altar at the Holy Communion.

Certain temples are national holy places, like the Pantheon at Rome, the *ka'bah* at Mecca, and similar great temples in important centres. Pilgrimages are often made to temples, and temples form asylums whither criminals flee for safety. Frequently there is much symbolism connected with the temple, and attention is paid to the direction in which it faces, most temples facing the east or the place of the rising sun. Very often in connexion with one great temple there will be a series of lesser shrines for other divinities, all forming a group of sacred buildings within the area. The area is usually enclosed by a wall with gates, which are often most elaborate, and avenues, while pillars and poles stand about it, and it is often decorated with flags and streamers. It is interesting also to notice how frequently with the change of a religion the old sacred places are retained, and successive buildings occupy the old site, or the same temple serves for new deities.

TEUTONIC RELIGION.—I. *INTRODUCTORY.*—**1. Position of the Teutonic peoples.**—We have no detailed information (and indeed little historic evidence of any kind) relating to the Teutonic peoples before the time of Julius Cæsar (58 B.C.). For the first one and a half centuries A.D., however, a comparatively large amount of evidence is obtainable. During this time the area occupied extended from the Rhine to the basin of the Vistula. From the Roman empire it was separated by the rivers Rhine and Danube and by a fortified line connecting these two rivers. On the east and south-east the boundaries of the Teutonic area cannot be determined with any precision—the plain of Hungary was occupied largely by Sarmatian peoples, but it seems probable that the Teutonic peoples extended into the basin of the river Dneister. In the north they undoubtedly occupied the kingdom of Denmark and considerable portions of the Scandinavian peninsula.

From the 3rd to the 6th cent. the Teutonic peoples extended their dominions considerably to the south-east, south, and west. The Goths conquered a large portion of S. Russia, and from about 260 to 270 the Romans had to give up to them their territory of Dacia (north of the Lower Danube); moreover, about the same time the Alamanni occupied the Black Forest region. During the 4th cent. bands of warriors, in ever-increasing numbers, began to enter the Roman service, and towards the close of the century a large section of the Goths was admitted *en bloc* within the Roman territories in the Balkan Peninsula. Between 406 and 486 all the western territories of the empire were conquered by the Teutonic peoples, of which the most important were: (1) Visigoths, who occupied S. France and Spain after 412; (2) Ostrogoths, who occupied Italy, 489–553; (3) Vandals, who crossed the Rhine in 406, and in 429 passed over into Africa, which they held for over 100 years; (4) Burgundians, who crossed the Rhine shortly after the Vandals and in 443 occupied S.E. France; (5) Alamanni, who went into Alsace and Switzerland about the same time; (6) Bavarians, who occupied the Alpine regions farther east probably about the same date; (7) Franks, who conquered and occupied successively one part after another of Gaul from 428 onwards, becoming supreme by their victory over the Visigoths in 507; (8) Langobardi, who, after occupying for some time the province of Austria and the Alpine regions to the south, passed into Italy about 568 and brought the greater part of the peninsula under their dominion; (9) English, who conquered and occupied most of the southern half of Britain from about the middle of the 5th cent. onwards.

Before the end of the 8th cent. a new series of movements began among the Northern peoples, an activity almost entirely maritime and lasting throughout the 9th and 10th centuries; this period was commonly known as the Viking Age. While it lasted, large numbers of piratical adventurers settled on the coasts of the Scottish islands, of Ireland, of the Netherlands, and of N. France. The last named, occupied by the vikings under the leadership of Hrólfr, son of Rögnvald, officer of Harold the Fair-haired, king of Norway, became after 911 the earldom of Normandy. From 866 onwards a large part of England too came under Scandinavian rule, though this domination was only temporary. In 870, however, those Norwegian chieftains who were unwilling to accept the sovereignty of Harold the Fair-haired began permanently to settle in Iceland, and more than 100 years later, in 985, Greenland was colonized from Iceland. Contemporaneous with these events were similar movements across the Baltic, which probably emanated mainly from Sweden. The establishment of the Russian kingdom (traditional date 859) was due to such bands of adventurers. In the East we hear of raids by parties of Scandinavians as far as the Caspian.

2. The conversion of the Teutonic peoples.—As conversion was in general due to direct contact with the Romans, we find those Teutonic peoples first converted who were settled within the territories of the empire. Before the middle of the 4th cent. the conversion of the Goths by Wulfilas to the Arian form of the Christian religion had begun and was practically complete within a generation. From them this religion must have spread very rapidly to the Gepidæ in E. Hungary and to other neighbouring peoples, since the Vandals appear to have been converted before the great movement to the West began. The Rugii in the province of Austria, the Langobardi, and some of the Burgundians also adopted the Arian form of Christianity, while the Franks before the close of the 5th cent. and the English in the 7th were converted to Catholicism. It was due largely to the efforts of Irish and English missionaries that between the 6th and 8th centuries the remaining peoples on the Continent (except the Danes), viz. Alamanni, Bavarians, Old Saxons, and Frisians, were converted. In the 8th cent. after great difficulty Charlemagne enforced the adoption of Christianity throughout the territory of the Old Saxons who had been conquered by him. Among the Danes and the Swedes missionary enterprises met with some temporary success, especially in the 9th cent. during the time of the missionary bishop Ansgar (826 to his death in 865). But Christianity was not permanently established in Denmark till after the defeat of Harold Gormsson by Otto II. in 973. In Norway Hákon I. (934–960) and his successors Harald II. and his brothers (960–975) were Christians, but the country was very little affected till the time of Olaf Tryggvason (995–1000), to whom conversion was really due. Many of the Scandinavians settled in the British Isles were converted before the close of the 9th cent., and these countries had become entirely Christian in the course of the 10th century. Some of the early settlers of Iceland had been converted to Christianity in the British Isles, but it was abandoned by their descendants and not established in the island till 1000. The traditional date of the establishment of Christianity in Sweden was 1008, but it was only towards the close of the 11th cent. that the heathen religion was entirely abolished. The adoption of Christianity by the Russians dates from 988.

3. Authorities.—(1) The little information which we possess relating to the religion of the Teutonic peoples during the period before their invasion of Roman territories in the 5th cent. is derived from the writings of Cæsar, Strabo, and Tacitus—especially from Tacitus' *Germania*, written in the 1st century. Some little evidence is also furnished by Roman inscriptions. Still less information is to be obtained from the period during which the Teutonic peoples living on the Continent were converted, though a few scattered notices are preserved in the writings of Ammianus Marcellinus (late 4th cent.), of Jordanes (*c.* 550), and especially of Procopius (about the same

date). In the 8th and 9th centuries a little evidence is to be derived from laws and capitularies in which heathen practices are prohibited, and survivals of heathen practices are occasionally noticed in writings of a much later date. The authorities until the 6th cent. are entirely Greek and Latin, in the 7th Latin alone, and with the exception of Jordanes, a monk of Gothic family, we have no records of Teutonic nationality.

As to actual beliefs we learn very little. The only myth which has come down to us is of Langobardic origin and connected obviously with an attempt to explain the name of that people. It occurs for the first time in the *Origo gentis Langobardarum*, an anonymous work dating probably from the 7th century. There are also two German metrical charms from Merseburg which deal with mythological subjects (10th cent. MSS). Beyond this we have scarcely more than a few names, particularly those of the days of the week, which are translations from Latin and date probably from the 4th century.

(2) *English.*—In England most of the evidence available, which is but little, is contained in the writings of Bede († 735), who in the *Chronicle* attached to the *de Ratione Temporum* has left an account of the calendar used by the English in heathen times. A few references to their religion before conversion are preserved also in the *Ecclesiastical History*. No Anglo-Saxon poems have come down to us in a purely heathen form, but a certain amount of information relating to heathen practices and beliefs may be obtained from *Beowulf* and also from certain shorter poems, especially from charms. We may also learn something of the mythological conceptions of the English from glossaries, letters, and other writings.

(3) *Danes and Swedes.*—Certain foreign Latin works throw light on the religion of the Danes and Swedes. Particular mention may be made (for the Swedes) of the *Life of St. Ansgar* written by his disciple Rimbertus, and of the work of Adam of Bremen, who in the 4th book of his *History of the Church of Hamburg* gives an important description of the sanctuary at Upsala. Later Danish historians add considerably to our knowledge both of religion and of mythology for Danes and Swedes. In particular we have the *Danish History* of Saxo Grammaticus (*c.* 1200), much of the information in which is obtained from Icelandic sources. He himself acknowledges this in his reference to the men of Thule:

'Their stores, which are stocked with attestations of historical events, I have examined somewhat closely, and have woven together no small portion of the present work by following their narrative.'[1]

Some important evidence from earlier times is also to be obtained from inscriptions and sculptured monuments of the heathen period.

(4) *Norway and Iceland.*—(*a*) For the religion of Norway and Iceland far more abundant information is available from the Icelandic sagas, the evidence of which varies greatly in value. First in importance are the *Íslendinga Sögur* ('Stories of the People of Iceland'), anonymous works written chiefly in the 13th cent., though a few may be slightly older. These are based on oral sagas—stories preserved by oral tradition in a more or less fixed form of words—from the latter part of the 10th and early 11th centuries. Among these special mention may be made of *Eyrbyggja Saga*, which in its early chapters gives an account of the religious practices of a certain Thórólfr of Mostr, who emigrated to Iceland *c.* 884 to escape from Harold the Fair-haired. Much information relating to religion is also given in *Egils Saga*, *Njals Saga*, *Viga-Glúms Saga*. These sagas tell us not only of the religion of Iceland itself, but also of the homeland Norway both before and after the settlement. For throughout the period covered by the *Íslendinga Sögur* (till *c.* 1030) it was customary for Icelanders to visit the home country, and consequently the scene of the sagas is often laid in Norway.

Next in order to these come the *Stories of the Kings of Norway*, contained in the important collection known as the *Heimskringla* by Snorri Sturlason († 1241). As an authority for the period of Harold the Fair-haired, he is not inferior to the writers of the *Íslendinga Sögur*, but his account of earlier periods, contained in the first saga, *Ynglinga Saga*, is legendary. The longer sagas of *Olaf Tryggvason* and of *St. Olaf*, in the *Flateyjarbók* and in the *Fornmanna Sögur*, offer a large amount of additional information, which in general is of a more legendary character than Snorri's sagas of the same kings, but all these sagas deal primarily with Norway. Much information too about religious practices and beliefs is contained in various stories of ancient time—the *Fornaldar Sögur*—which, like the *Íslendinga Sögur*, are for the most part anonymous, but of which the authority is much inferior to that of the latter. In part they are derived from earlier poems, some of which are inserted in the text. But there is no doubt that much fiction is embodied in these stories. The most important are *Hervarar Saga ok Heidhreks Konungs* and *Gautreks Saga*.

(*b*) For Norse mythology the chief sources of information are the poems commonly known as the Older Edda, the MSS of which date only from the 13th century. The poems themselves, on the other hand, are for the most part considerably older, most of those on mythological subjects dating probably from the 10th cent. and even in some cases from the 9th, and belonging consequently to the heathen period. The poems which give us most information are *Völuspá*, *Vafthrúthnismál*, and *Grimnismál*. The first deals with the cosmogony and fate of the gods. The second is in the form of a dialogue on mythological lore between Othin and the giant Vafthrúthnir. The third is a monologue by the disguised Othin, who gradually reveals himself by his mythological knowledge. Next in order of importance are *Lokasenna*, another dialogue poem in which Loki attacks various gods and goddesses with scandalous charges; *Skirnismál*, which tells of the wooing of Gerthr for the god Freyr; *Hymiskvitha* and *Thrymskvitha*, descriptions of the adventures of the god Thor; *Vegtamskvitha* ('Balder's Dreams'), a dialogue between Thor and a ferryman supposed to be Othin; *Alvíssmál*, a dialogue between Thor and a dwarf; *Hyndluljóth*, a dialogue between the goddess Freyja and a giantess Hyndla. Much mythology is also contained in the philosophical poem *Hávamál*, and incidentally in some of the heroic poems in the same collection.

In addition to the Edda poems there have been preserved the so-called 'skaldic' poems dating from the 9th and 10th centuries by known authors. The earliest of these (early 9th cent.) are fragments of poetry by Bragi Boddason, some of which are preserved, and which we know come from *Ragnarsdrápa*. To the late 9th cent. belong the *Ynglingatál* and *Haustlöng* by Thjóthólfr of Hvin, a genealogical poem describing the ancestors of the Norwegian royal family. To the same century belongs the poet, Thórbjörn Hornklofi. The *Eiríksmál*, an incomplete poem whose authorship is unknown, describes the death of Eric Blood-axe shortly after 954.

There are also extant two poems by Eyvindr Skaldaspillir, the *Hákonarmál* recounting the death of Hákon I. in 960, a copy of the *Eiríksmál*, and the *Hdleygjatál*, a genealogical poem dealing with the ancestors of the earls of Lathir, and modelled on *Ynglingatál*. References to mythology are also contained in many other poems.

It is to be noted that our knowledge of mythology comes almost entirely from Icelandic sources, for even the Norwegian poems—including the poems of the Edda, many of which were doubtless composed in Norway—are preserved only in Icelandic MSS. The chief reason for this phenomenon is doubtless to be found in the peculiar faculty for oral tradition developed in Iceland during the 11th cent. or slightly earlier, for which it would be difficult to find a parallel in Europe, except in Ireland. The unusual conditions under which Iceland was converted afford another reason, for there Christianity was not forced from above, as in countries with monarchical government. Indeed in Iceland there existed no strong central power which could effectively stamp out the observances and eradicate the remembrance of the old faith. The traditions of the heathen age survived the hostility of the Church in the 11th cent. and formed evidently a leading source of literary and antiquarian interest to subsequent generations.

A systematic account of Norse mythology is given in Snorri's Edda (commonly called the Prose Edda), the first part of which, *Gylfaginning* ('the Befooling of Gylfi'), is entirely devoted to the subject. Much mythology too is also introduced incidentally into the second part, *Skáldskaparmál* ('the Language of Poetry'). The chief authorities used by Snorri here are the poems of the Edda (*Völuspá*, *Vafthrúthnismál*, and *Grimnismál*). He makes use also of some lost poems and also no doubt of oral tradition.

Another account, which, however, has very little in common with the Edda, is given by the same author in the opening chapters of *Ynglinga Saga*. In it the gods are represented as having lived on earth as the rulers of the Swedes in ancient times—an account in which the euhemeristic element is prominent. A certain amount of mythological information also is afforded by the *Fornaldar Sögur*.

(*c*) The chief authority for the ethics of heathen times is the Edda poem called *Hávamál*, which, properly speaking, appears to be a composite work, made up of five different poems. In substance it may be compared with Hesiod's *Works and Days* or with the early Egyptian *Wisdom of Ptah-hetep*.[1] Such maxims occur in several other Edda poems, particularly in *Fáfnismál* and *Sigrdrífumál*. They are also common in the earliest Anglo-Saxon poems, though these do not often contain distinctively heathen precepts. The ethical standards of heathen times are no doubt faithfully portrayed in early Norse poetry and in sagas relating to the same period. With certain reservations the same may be said of *Beowulf* and other Anglo-Saxon poems.

4. Difficulties.—One of the greatest difficulties which the student of Teutonic mythology has to face is the question of how far the mythology and religious practices found in Iceland alone or in Iceland and Norway were shared also by the Danes and Swedes or by the Teutonic peoples in general. Indeed so little evidence is available, except for Iceland and Norway, that neither positive nor negative conclusions can be drawn with any confidence. Thus we have no information except from Norwegian-Icelandic sources of some of the more important deities, such as Freyja and Heimdallr; yet are we justified in assuming that these deities were unknown except in Norway and Iceland? One is forced to hesitate; for occasionally evidence is forthcoming for characters or conceptions which one might justifiably have assumed to be the creation of Norse literature. Othin's horse, Sleipnir—to quote one instance—is

[1] Tr. O. Elton, p. 5.

[1] Tr. by E. A. W. Budge ('Egyptian Library').

represented as having eight legs in Norse mythology, and we find a clear representation of such a horse on an engraved monument at Tjängvide, Götland.[1] The riding *valkyrjur* too (one of the most picturesque conceptions of Norse mythology) might well have been regarded as the creation of Norwegian poetry, had we not met with the same conception on a Swedish inscription at Rök; indeed with great probability it may be traced also in an Anglo-Saxon charm.

Another difficulty which confronts the student is that at first sight there appears to be an irreconcilable discrepancy between the account of Norse mythology given by Snorri and the references to religious beliefs and observances recorded in the *Íslendinga Sögur*. The former represents Othin as the chief and most important god of the Norse pantheon; and the early poems of the Edda and of the skalds agree with this representation. The *Íslendinga Sögur*, on the other hand, scarcely records a single instance of worship of Othin. In them Thor is by far the most prominent deity, and after him Freyr. It is only in the *Fornaldar Sögur* and in the other sagas relating to the legendary period[2] that we find Othin prominent. The explanation of this fact is probably that the worship of Othin and that of Thor belong to different classes of the population; the former was the god of the royal families and of their military followers, while the latter was the god of the free population in general. Kingship never existed in Iceland, and very few settlers appear to have been of royal blood, and consequently the god of this class of society, though still celebrated in poetry, does not seem to have received any actual worship.

Lastly, one characteristic of Norse mythology may doubtless be accounted for by the fact that so much of our information is drawn from Iceland. In peculiar contrast to the mythologies of other peoples, the Norse deities are not associated with particular localities, and herein no student can fail to contrast Norse and Greek mythologies. Freyr indeed is traditionally associated with Upsala, and there are indications which connect Gefjón with Sjaelland; but these instances are rare. The homes of the gods mentioned in the Edda poems—Breithablik, the home of Balder, Himinbjörg, the home of Heimdallr, etc.—seem to be purely mythical. Some evidence is to be found in place-names, however, that various deities were connected with localities in Norway, Sweden, and Iceland as well as with districts in other Teutonic lands. The reason for this comparative absence of local association is obviously to be found in the fact that by their emigration the colonists were cut off from the ancient sanctuaries of their race.

II. *GODS, SPIRITS, AND MYTHICAL BEINGS.*—Since Norse literature offers an abundance of material for the study of its mythology and religion, it seems almost necessary to make it the basis of any description of Teutonic mythology and religion. In the following account under each heading an attempt will be made to show also how far the testimony available for the mythology of the other Teutonic peoples is corroborative or discordant. In the first place, it is convenient to distinguish between (1) beings essentially mythical and (2) beings or phenomena in themselves natural but treated mythologically.

i. BEINGS ESSENTIALLY MYTHICAL.—This class consists of the following: (1) *aesir* (sing. *áss*) and *vanir*, (2) *jötnar* (sing. *jötunn*), (3) *dvergar* (sing. *dvergr*), (4) *álfar* (sing. *álfr*), (5) *nornir* (sing. *norn*), (6) *valkyrjur* (sing. *valkyrja*), (7) *fylgjur* (sing. *fylgja*), (8) *landvaettir*, (9) such impersonal conceptions as Yggdrasil's ash.

[1] Cf. Du Chaillu, *The Viking Age*, i. 58.
[2] Cf. *Ynglinga Saga*.

1. **Aesir and vanir.**—(*a*) *Norse.*—It is a peculiar characteristic of Norse mythology that it possesses two classes of gods. To the *aesir* belong Othin, his sons Thor, Balder, Vali, Vithar,[1] his brothers Vili and Ve,[2] and others. To the *vanir* belong Njörthr and his children Freyr and Freyja. Possibly also to the same class belongs Heimdallr, for, though this is not altogether proved by *Thrymskvitha*, 14, yet the fact that he is often associated with Freyja, apparently as her guardian, points in this direction.[3]

The story of the relationship of the two sets of gods is told most fully in *Ynglinga Saga*, 4. There had been a war between them, which was eventually settled by an exchange of hostages. Njörthr and his children were given as hostages to the *aesir*, and Hoenir accompanied by Mímir was sent as a pledge to the *vanir*. This story, in part at least, is known to early poetry. In *Völuspá*, 24, it is suggested that the *vanir* were successful, while in *Vafthrúthnismál*, 39, we are told that Njörthr had been given as a hostage to the *aesir*, and that he would return home to the *vanir* at the '*Ragnar Rök*.'

Apart from the *vanir* the divine mythology is confined to the *aesir*, in which term all the gods collectively are included. With them there are goddesses, known comprehensively as *ásynjur*, the chief of whom is Frigg, wife of Othin. Often Freyja of the *vanir* is included with this group.[4]

Besides the *aesir* and the *vanir*, we find two deities who belong to neither class and who indeed are never brought into connexion with the Norse pantheon, viz. Thorgerthr Hölgabruthr and her sister Irpa. Their worship was very prominent in Norway during the last years of the heathen age, especially under Earl Hákon of Lathir, who ruled Norway from 975 to 995 and who was specially devoted to their cult. Of myths connected with them we have no mention in Norse literature except what is apparently a confused reminiscence in *Skáldskaparmál*, 45. Their story is told only by Saxo,[5] who says that Thora (Thorgerthr) is the daughter of Cuse (*i.e.* Gusi), king of the Lapps, and wife of Helgi, the eponymous hero of Halogaland. It is generally believed that these deities hail from the north of Norway, and their character is Finnish (Lappish) rather than Norse.

Under the lordship of Othin the gods form an organized community, which is evidently modelled after the fashion of the ancient Scandinavian community. They have a council of twelve, whose duty it is to keep up the sacrifices, to deliberate on the government of the country, and to judge between man and man.[6] Councils of this type are found in many early Scandinavian countries, and there can be little doubt that in heathen times they had religious as well as judicial functions. In *Grímnismál* the gods are said to meet daily at Yggdrasil's ash. From the same poem we learn that each of the gods had a home of his own, the names of which are apparently mythical and generally adapted to the character of the god, Breithablik for Balder, Alfheimr granted as a tooth gift (*at tannfé*) to Freyr, etc. The most frequently mentioned is Othin's home of Valhöll ('the hall of the slain'), where he, together with the valkyries, entertains hosts of slain warriors, who pass their days in combat and their nights in feasting. In *Gylfaginning*, 23, some verses are quoted indicating that Njörthr loves living by the sea-shore, while his wife Skathi, daughter of Thjazi, a *jötunn*, prefers to dwell in her father's home, the mountains. Wherefore a compact is made by which they divide their time between the two places—Njörthr's home is called here

Nóatún. The association of Freyr with Upsala does not belong to this category.

Besides their individual homes, the gods collectively are said to inhabit Asgarthr. Their meeting-place is called Ytha-völlr.[1] In *Gautreks Saga*, 7, the hero Starkathr is represented as attending a conference of them held in a forest clearing. The significance of this (together with Yggdrasil's ash and the fact that *völlr* originally meant 'wood') is seen below, § IV.

A totally different account of the gods is given by Snorri, curiously enough, in the early chapters of *Ynglinga Saga*. Here they are represented as men who had once lived on the earth and come to Sweden from S.E. Europe. Othin is represented as dying and being succeeded in the leadership of the gods by Njörthr, whose reign was marked by prosperity and peace. The latter on his death was succeeded by his son Freyr, whose reign was of the same character. Freyr was succeeded by his sister Freyja, and she in turn by Freyr's sons, grandsons, etc., who are no longer represented as gods.[2] This story is no doubt of euhemeristic origin, but the association of Freyr with Upsala is ancient and traditional. In Saxo he is represented as instituting the Upsala sacrifices and is said to be the ancestor of certain Swedish warriors. *Ynglinga Saga* itself is largely based on an early poem *Ynglingatál*, which traces the ancestry of the ancient Norwegian royal family through the Swedes to Freyr, who is no doubt to be identified with Fricco of Adam of Bremen's account.[3]

There are many stories relating the appearances of the gods to men. These occur most frequently in the *Fornaldar Sögur*, and the deity most mentioned is Othin.[4]

(*b*) *Danish and Swedish.*—On examining non-Norse sources, we find a number of the Norse gods mentioned by Saxo, including Woden (Othin), Thor, Freyr, Frigg, and Oller (Ullr), as well as Balder and Hoder (Höthr), who, however, are by him represented as demi-god and human being respectively. It is not always clear how far Saxo draws from Icelandic sources, but there can be little doubt that these deities were known to him from Danish tradition. Freyr is constantly associated with Upsala and Sweden, and Saxo is also the only authority who gives the story of Oller (Ullr).[5] With Saxo the home of the gods is sometimes called Byzantium, which apparently is used to translate Asgarthr.

With regard to Swedish beliefs, we have important earlier evidence in Adam of Bremen's description of the sanctuary at Upsala. This contained the images of three gods, Thor, Woden (*i.e.* Othin), and a deity Fricco, who is in all probability to be identified with Freyr. No stories of the gods are, however, recorded from Sweden. In much earlier times we have a short account of the religion of the people of Thule (*i.e.* Scandinavia) written by Procopius.[6] The only deity specially mentioned by him is Ares, and it is not clear whether by this name we are to understand Othin or Tyr. An early trace of worship of Freyr may be preserved in the name Prove(n)—the god among the Wagri of N.E. Holstein.[7]

(*c*) *English.*—For the mythology of the heathen English we have little or no information except that to be obtained from names. The A.S. word *os*, corresponding to the O.N. *áss*, occurs as the name of one of the letters of the Runic alphabet (though here apparently its meaning is forgotten).[8] It also is to be found very frequently in personal names, as in Oswald, and the plural form occurs only in the genitive *esa* in an A.S. charm.[9] The form *van-* does not occur, except rarely in personal names—*e.g.*, Wanraed—unless this is possibly the origin of the prefix *wan-* in *wanseoc* ('epileptic'), in which case we might compare *elf-adl* in Saxon *Leechdoms*,[1] ii. 344. 20.

Othin's name also is preserved—A. S. Woden—as the ancestor of all the royal families except that of Essex, which traced its genealogy to a certain Seaxneat. His name is also preserved in 'Wednesday' (as a translation of 'Mercurius'). Thunor (O.N. Thorr) is known only from 'Thursday' (where his name is used to translate 'Juppiter') and from certain place-names, *e.g.*, Thunresleah and Thunresfeld.[2]

The name of Fri (*i.e.* Frigg) is preserved only in 'Friday' (as translation of 'Venus'), and Ti (Tiig) (O.N. Tyr) occurs in glossaries as translation of 'Mars,' and, like *os*, is the name of one of the letters of the Runic alphabet His name is preserved also in 'Tuesday.' In Bede's account of the heathen English calendar two months (corresponding to March and April) are said to derive their names from goddesses called Rheda (Href?) and Eostre (Eastre). The existence of these deities has been doubted by some modern writers. We also find a reference, in a charm which appears to be a mixture of Christian and heathen beliefs, to Erce ('Mother of Earth'), with which we may compare Semnes Mate (Lettish).

Lastly, mention may be made of Ing, the name of one of the letters in the Runic alphabet. In the verses dealing with Ing he is said to have been seen first among the East Danes, but afterwards he went east over the sea, his car speeding after him.

(*d*) *German.*—With regard to German mythology, a fragment relating to gods is preserved in one of the Merseburg charms, in which we are told that Wodan and 'Phol' were riding to the forest when the pastern joint of the latter's horse was dislocated. Various deities tried by their incantations to put it right. The names mentioned are Frija and her sister Volla,[3] and Sinthgund and her sister Sunna. The only other myth recorded occurs in certain Langobardic writings and is rather striking.

'The two tribes of Vandals and Langobardi (then called Winniles) appealed to the gods for victory in their war with each other. The Vandals approached Woden, who replied: "Whatsoever I shall first look upon when the sun rises, to them will I give victory." The Winniles appealed to Frija, wife of Woden, who gave counsel that at sunrise the women of the Winniles should come with their husbands and let down their hair about their faces, like beards. And when Woden saw the Winniles women, he said: "Who are these Longbeards?" And Frija replied: "As thou hast given them a name give them also victory." And he gave them victory.'[4]

Apart from these references, the gods are known from the names of the week: Donar (O.N. Thorr; A.S. Thunor) throughout the German area; Fria (Frigg, Fri) at least in the greater part of German area; Wodan (Othin, Woden) only in the north-west and in Holland; Tiu (Ti, Tir) only in the south-west. Occasional references to the gods are also found in lives of missionary saints. Thus the worship of Wodan among the Alamanni is mentioned in Jona's *Life of Columbanus*, while in other cases German deities are no doubt intended by old names such as Juppiter. In a formula used after baptism and commonly supposed to have come from the region of the Old Saxons (though the language is rather peculiar) the convert is required to abjure Wodan and Thunor and Saxnot together with other monsters (*Unholden*) associated with them. This Saxnot is doubtless to be identified with the name that stands at the head of the genealogy of Essex. Lastly, in Alcuin's *Life of St. Willibrord* we hear of a god called Fosite. He was worshipped on a certain island, called after him and identified

by Adam of Bremen with Halogaland.[1] Grimm and others have identified this deity with Forsete, the son of Balder,[2] but discrepancies in the spelling of the two names offer difficulty.

In Gothic no names of deities have been preserved, unless we place in this category the name of the Runic letter Enguz (A.S. Ing). The word *ansis*, however (O.N. *æsir*), is mentioned by Jordanes in a curiously interesting connexion. He states that the Goths called their chiefs to whose good fortune they thought they owed their victory, 'non puros homines sed semideos id est anses.'[3] In earlier times Tacitus,[4] though unfortunately he seldom mentions Teutonic gods by their native names, twice mentions Mars and Mercurius among the deities of the Germans, and in the *Germania* specially mentions Mercurius as the deity most worshipped by them. There can be no doubt that the deities meant are the later Ziu and Wodan (N. Tir and Othin). In ch. 9 too he mentions Hercules and in *Annals*, ii. 12, a grove sacred to him. It is not so easy to ascertain the identity of this deity. Some modern writers believe Donar (O.N. Thorr; A.S. Thunor) to be intended; others think the reference is to a tribal deity.[5] In the same chapter Tacitus states that some of the Suevi worship with the symbol of a ship. Here again we are left in doubt as to the identity of the deity. Perhaps we may include the 'templum Tamfanæ' mentioned in *Annals*, i. 51, and 'lucum quem Baduhennae vocant' in iv. 73, if these be the names of deities. In *Germ.* 43 he speaks of a grove in which Castor and Pollux are worshipped under the name of deities. The fullest account, however, of a Teutonic deity is that of Nerthus,[6] who was worshipped by certain maritime peoples including the English, and whose sanctuary was situated on an island, the position of which is not clearly stated by Tacitus but is probably to be placed in the S.W. Baltic. It is to be observed that the name Nerthus is identical with the O.N. Njörthr, and, in spite of the difference in sex, we need scarcely doubt their original identity. Rites similar to those which Tacitus describes in connexion with Nerthus are associated with Freyr, son of Njörthr.

Apart from Tacitus, practically the only references to Teutonic deities occur in inscriptions upon altars raised by soldiers in the Roman service. Besides Mars, these inscriptions sometimes record a deity Nehalennia with the prow of a ship, and this may point to the identification with the Isis of Tacitus. In the introduction to *Germ.* 2 Tacitus states that in their ancient poems the Germans trace the origin of their race to a god called Tuisto ('son of earth'). His son was Mannus (? 'man'), and he again had three sons from whom three groups of peoples were named and descended—the Ingaevones (or Inguaeones), Ermi[n]ones, Istaevones. These group-names are mentioned also by Pliny the Elder, and a genealogy of the kind classifying Teutonic and other peoples is found in Merovingian times. We have no trace elsewhere of any god or hero called Istio, but there is some slight evidence for an Irmen. The name Ingaevones (or Inguaeones) is undoubtedly to be connected with A.S. Ing, who is associated in tradition with the Danes and with the titles Inguina Eodor and Frea Inguina, used in *Beowulf* of the king of the Danes. It is further to be noticed that in Norse the god Freyr and his descendants sometimes bear the title Yngvi, the full title of the god being Yngvi-Freyr or Ingunar-Freyr. His descendants—the ancient kings of Sweden—are known collectively as Ynglingar. It will be seen that there is some discrepancy between Norse and English tradition, the former connecting the name with Sweden, the latter with Denmark. Whatever may be the explanation of this, the association of the word with Freyr, the son of Njörthr, seems to point to some connexion with the worship of Nerthus—a conclusion which is confirmed by the fact that Tacitus, with whom Pliny is substantially in agreement, describes the Ingaevones as 'proximi oceano.'

2. Jötnar.—(*a*) *Norse.*—Giants or monsters play an important part in the stories of Norse mythology. When viewed collectively, they are called *jötnar* or *thursar*. Sometimes also we hear of the *hrímthursar* ('frost-giants') and *bergrisar* ('cliff-giants'). Most often, however, they appear singly, and the corresponding feminine form of the word *jötunn* is *gygr*. Unlike the *æsir*, they do not appear to form an organized community as a whole, though sometimes individual *jötnar* (like Thrymr, 'Lord of the Thursar') seem to have communities under their dominion. The home of the giants is known as Jötunheimar, lying, according to early story, far to the north-east, remote from Asgarthr, the home of the *æsir*. The general characteristics of the giants were huge form and superhuman strength.

The story of Skrymnir[1] tells dramatically how huge and strong a giant was conceived to be in Norse literature. For the god Thor took refuge one night in the thumb of one of his gloves, and, when he attempted to kill the giant with a blow of his hammer, Skrymnir only asked whether a leaf had fluttered down into his face.

Although the giants may have had monster shapes, it seems clear that sometimes the giantesses were deemed very beautiful, as in the case of Gerthr, to whose radiant beauty Freyr lost his heart.

It is necessary to distinguish between anthropomorphic and theriomorphic giants, though it is difficult to draw a definite line between them; *e.g.*, Loki has theriomorphic children. Many of the former class are mentioned in myth, the best known being Thrymr, Hymir, Hrungnir, Geirröthr, and Thjazi, all of whom fight with Thor, and are slain by him.

Sometimes the *jötnar* are on friendly terms with the *æsir* Hyrrokin, a giantess, attended Balder's funeral, and it was through an appeal to her strength that the funeral ship was able to be launched. Further, we find a number of marriages between gods and giants; Njörthr married Skathi, the daughter of Thjazi.[2] Freyr married Gerthr, daughter of Gymir; and even Thor, despite his general hostility, had a son Magni by a giantess Jarn-Saxa. This giantess, with others, including the daughter of Geirröthr, appears as the mother of Heimdallr in *Hyndluljóth*, but this part of the poem (the short *Völuspá*) is commonly believed to be a late composition. The giants too are often represented as wanting to marry *dsynjur*; Thjazi carries off Ithunn, and Freyja was sued for by Thrymr. It may here be mentioned that anthropomorphic giants often had the power to assume the form of animals. In the incident referred to above Thjazi assumes the form of an eagle, and in *Vafthrúthnismál*, 37, the wind-demon Hraesvelgr is described as a *jötunn* in the shape of an eagle.

Although the giants are presumably gifted with tremendous physical strength, they are not always lacking in intelligence, for we have the incident of Othin's visit to the giant Vafthrúthnir in order to learn of his store of wisdom.

The chief theriomorphic *jötnar* are the Mithgarthsormr, or Jörmundgandr, and the Fenrisulfr, both of whom together with Hel are said to be the offspring of Loki and the giantess Angrbotha ('she who bodes distress'). Mithgarthsormr is represented in *Gylfaginning*, 34, as a kind of vast sea-serpent stretching round the earth. In *Hymiskvitha*, 23, Thor goes fishing and catches it on his hook. Fenrisulfr is a wolf which the gods succeed after great difficulty in fettering, though not until he has bitten off Tyr's hand, which has been placed in his mouth as a pledge of the good faith of the gods.[3] At the end of the world he will burst his bonds and attack the gods in conjunction with Mithgarthsormr, Loki, Surtr (a fire-demon), and other monsters. Although usually found in the company of the *æsir*, it would seem that Loki belonged to the *jötnar*. Here also we should perhaps mention Ægir, also called Hlér, a sea being, who is on friendly terms with the gods and visits them.[4] From *Fornaldar Sögur*, ii. 17, it seems clear that he was the son of Fornjotr, and in *Hymiskvitha*, 1, 2, he is described as a *berg-búi* ('cliff-dweller'), an epithet which is elsewhere synonymous with *jötunn*. His wife is called Ran,

2 According to *Hdleygjatdl*, she was later also the wife of Othin.
3 Cf. *Gylf.* 34.
4 Cf. *Lokasenna* (prose introduction); *Bragaroethur*, 55.

and is said to have a net in which she catches all who perish in the sea. There is a suggestion too from the story in *Frithjófs Saga*, 6, that a man fearing death by drowning would do well to carry gold on his person in order to be received well in the halls of Ran.[1]

Apart from mythological works monsters are not infrequently mentioned both in the *Íslendinga Sögur* and in sagas of the kings, as well as in the *Fornaldar Sögur*, though they are more usually called *tröll* than *jötnar*.

As examples we may refer to the two demons (male and female) at Sand Haugar in the north of Iceland encountered by Grettir;[2] the female demon who ate eleven merchants in a rest house in the Norwegian mountains;[3] and the monster Brusi and his mother in the form of a black cat encountered by Ormr Stórolfsson in the *Saga of Olaf Tryggvason*.

In those *Fornaldar Sögur* which deal with the north of Norway, viz. *Ketil Saga Haengs* and *Grims Saga Lothinkinna*, monsters are frequently mentioned. It may be noticed that Thorgerthr Hölgabrúthr once appears among them,[4] and Saxo's *Danish History* abounds with such stories. Tales like these recall Procopius's remark: 'The rest of the inhabitants of Thule . . . worship many gods and demons in heaven and in air and in sea and certain other daemonias which are said to be in the waters of springs and rivers.'

A spring was the home of Mímir. His story is given in *Ynglinga Saga*, 4, where the *æsir* send him with Hoenir as pledges to the *vanir*, who cut off his head and return it to the *æsir*. Othin then smears the head with worts to preserve it and keeps it for divining purposes. In *Völuspá*, 45, Othin is said to converse with Mímir's head. We are told further[5] that under one of the roots of Yggdrasil's ash is Mímisbrunnr ('Mímir's spring'), in which are hidden cunning and wisdom. Othin came to the brook asking a drink and was refused until he left his eye as a pledge. This he granted, and in *Völuspá*, 28, the sybil says: 'Mímir drinks mead every morning from the pledge of Othin.'

A reference to a Miming is made by Saxo[6] in his story of Balder and Höthr. Here Miming is called the 'silvarum satyrus,' and is said to have in his possession a sword and magic bracelets, the former of which alone of all swords will prevail against the charmed life of Balder. At the beginning of *Thithreks Saga* too Mímir is the name of the smith, teacher of both Sigfrit and Velint. It is to be noted also that Miming was the name of Weland's famous sword in the poem of *Waldhere*.

Perhaps originally Mímir was famed for his wisdom, but later tradition laid stress on his skill in smith's work. His name is preserved in modern Swedish folk-lore—Mímis-sjö and Mímis-ä ('sea of Mímir' and 'river of Mímir'), both of which preserve his connexion with water. His name is also mentioned in the mediæval German poem *Biterölf* as 'Mîme the old.'

(*b*) *Anglo-Saxon.*—The A.S. forms corresponding to the Norse *jötunn* and *thurs* are *eoten* and *thyrs*, and both terms are applied in *Beowulf* to the monster Grendel, who with his mother dwells under a pool in the fens and makes attacks on the hall of the Danish king whose knights he devours. As far as we can gather, these beings are anthropomorphic. The story of Beowulf's encounters is clearly to be connected with those of Grettir and of Ormr Stórolfsson and presumably has its origin in a folk-tale. In A.S. literature ancient weapons are sometimes described as being made by the giants.[7] In the *Gnomic Verses*, which form the introduction to the Abingdon text of the *Anglo-Saxon Chronicle*, the *thyrs* is said to have his home in the fens.

[1] For Ymir, the primeval giant out of whose flesh the world was made, see art. Cosmogony and Cosmology (Teutonic).
[2] *Grettis Saga*, ch. 65.
[3] *Saga of Olaf the Holy* (*Heimskringla*), 151.
[4] *Ketil Saga Haengs*, 5.
[5] *Gylf.* 15 (drawn from *Völuspá*, 29). [6] P. 35.
[7] '*Eald sweord eotenisc*' (*Beowulf*, l. 1558). The same expression is used for buildings of the past: 'Visible from afar are the (cities) skilfully built by the giants.'

(*c*) *German.*—There is no doubt that these monsters were known also in Germany, where we find for them the words *duris* (i.e. *thurs*) and *risi*. No stories dating from very early times happen to have been preserved, but mediæval German poetry and legend abound with references to such beings.[1]

3. Dvergar.—(*a*) *Norse.*—*Dvergar* is the name given collectively to the dwarfs in Old Norse literature, and to many of them are assigned individual names in *Völuspá*, 15 ff., where also their creation is mentioned. In *Gylfaginning*, 14, Snorri tells us that they first received life as maggots in the flesh of Ymir, but were endowed with intelligence by the gods, and given human shape. The *dvergar* were said to live either down in the earth or more frequently in stones (rocks), in front of which they were sometimes seen in the evening.

Svegdir one evening at sunset saw a dwarf sitting under a stone, and, when the dwarf called him to go into the stone, he assented, whereupon it shut behind him and naught has been heard of him since.[2]

It is perhaps to their connexion with rocks that the word for echo—*dvergmál* ('dwarf-speech')—owes its origin. In Norse literature they were renowned particularly for their skill in metal-work, and many were the wonderful things fashioned by their hands—so much so that a compound word has been formed to denote great skill, viz. *dverg-hagr*.[3]

On most occasions the dwarfs appear in human form, though small, but in *Reginsmál* Andvari lives in a water-fall in the shape of a pike and is caught in that form by Loki, who borrows Ran's net for the purpose. It is from him that Loki gets the gold required to ransom himself and his companions, Othin and Hoenir, from Hraethmarr, and this incident afterwards plays an important part in the *Völsunga Saga*. After this episode Andvari withdraws into the stone and curses all who shall possess the gold.

Possibly, too, 'Mimingus, sylvarum satyrus' mentioned by Saxo is associated with dwarfs, and possibly this Miming is identical with Völundr or Weland, the most famous of all smiths.

(*b*) The word corresponding to O.N. *dvergr* is to be found in all languages of the Teutonic peoples extant—O.H.G. *twerg*, A.S. *dweorh*. In A.S. literature we find a charm against a dwarf. Dwarfs also figure in German folk-lore. Thus in the *Seyfriedslied* the treasure which the hero won again after killing the dragon belonged in reality to some dwarfs, sons of Nybling.

4. Álfar.—For these see art. Demons and Spirits (Teutonic), vol. iv. p. 633.

5. Nornir.—For these see art. Doom, Doom Myths (Teutonic).

6. Valkyrjur.—(*a*) *Norse.*—Valkyries, or 'choosers of the slain,' were supernatural maidens sent by Othin to determine the course of battles and to choose warriors for Valhöll. They are also known as *valmeyjar*, *skjoldmeyjar*, and *óskmeyjar*, and in *Völuspá*, 31—if the phrase is not an interpolation—they are called *nönnur herjans*. By the Edda poems, *Grímnismál*, 36, and *Völuspá*, 31, we are given certain information about them, and of the former poem Snorri has made use in *Gylf.* 36. In *Grímnismál* our attention is drawn mainly to one aspect of the valkyries—their duties in Valhöll; for Othin is represented in the poem as crying to his maidens to bear him the ale as they do to the *einherjar*, when they are feasting in the evening in the hall. Here we have the names of thirteen valkyries given.

Snorri inserts this stanza from *Grímnismál* in his elaborate account of Valhöll in *Gylf.* 38, expanding it in prose and adding that Othin sends these maidens to battle. He specially mentions

[1] Cf. art. Demons and Spirits (Teutonic), vol. iv. p. 634.
[2] *Ynglinga Saga*, 15; also *Hervarar Saga*, 2.
[3] See art. Demons and Spirits (Teutonic), vol. iv. p. 633b.

Guthr, Rosta, and Skuld, the youngest norn, as undertaking this work. It is this function of the valkyries that the poet of *Völuspá* deals with in str. 31 of the poem. He gives us a picture of a band of valkyries, six in number and named, equipped and ready to ride into battle. From other references in Norse literature we learn that they were seen riding through the air and over the sea ('*lopt ok lög*'), white and shining with their helmets, shields, and spears—a splendid company of maiden warriors.[1]

With the valkyries may perhaps be compared the Slavic conception of the *vila*, who was thought to ride a seven-year-old stag and bridle him with snakes. The characteristic, attributed to her by the Slavs, of discharging fatal darts at men while in the air is especially interesting when compared with a similar reference in an A.S. charm.[2]

Other valkyries, who became the wives and lovers of heroes, and are represented as human in origin, although included by Othin among his battle-maidens, are mentioned below.[3] From a story in Saxo[4] we hear of maidens called 'nymphæ sylvestres,' who seem to be valkyries.

Hotherus (O.N. Höthr), the enemy of Balder, was hunting in a wood when he came to a lodge where he was greeted by certain wood-maidens. They told him that it was their lot to determine the fortunes of war and that often they secretly assisted their friends in battle, and gained for them the victory.

Since the valkyries were so closely bound up with the fate of warriors and the issue of battles, it is clear that they cannot be entirely dissociated from the norns. The close relationship between the two conceptions is clearly seen in the poem given in *Njáls Saga*, 156.

There in the accompanying prose account a certain Darruthr saw women riding twelve together to a bower, and, looking within, he saw that they had set up a loom of which 'men's heads served for weights, men's entrails for the weft and warp, a sword for the *skeith*, and an arrow for the *hrsell*.' They sang at their work and in their song seemed to describe themselves as valkyries, and finally they rode away, six to the south and six to the north.

Moreover, in *Gylf.* 36 Skuld, the 'youngest norn,' is included among the valkyries. In contrast with the norns, however, the valkyries are in Norse mythology associated chiefly with Othin, whose messengers they are, though in one passage quoted from Saxo they seem to assist Hother, who is an enemy of the gods.

(*b*) *Anglo-Saxon.*—In A.S. literature we find on several occasions the word *waelcyrge* (O.N. *valkyrjur*). In glossaries[5] it is glossed 'Erinys,' 'Bellona,' 'Tisiphone.' In Wulfstan's *Sermo ad Anglos* the *waelcyrge* are classed together with other undesirable people, and in a charm mention is made of certain women who ride over the land and array their forces. They hurl darts at human beings, who are thereupon seized with sudden pain. The word *waelcyrge* is not mentioned in the latter example, but there can be little doubt that the lines refer to them.

(*c*) *German.*—In German the word does not occur, though the idea does in the Merseburg charm, where they are called *idisi*. They are represented as fastening bonds, holding back the host, and tugging at the fetters.

7. Fylgjur.—For these see art. SOUL (Teutonic).

8. Landvaettir.—Just as the *fylgja* presided over the individual, so the *landvaettir* presided over the country as its tutelary spirits. A certain number of references are to be found to them in Norse literature, not the least interesting being the heathen law mentioned in the *Landnámabók*, iv. 7, which ordered that figure-heads of ships were to be removed on approaching the island, lest they should frighten the *landvaettir* with their 'yawning heads and gaping snouts.' In *Egils Saga*, 57, Egill turns a curse against the *landvaettir* of Norway in order to force them to drive away King Eric and Queen Gunnhildr, from whom he was fleeing. Sometimes *landvaettir* seemed to favour certain individuals, as was the case with Björn, the he-goat whom they accompanied to the assembly, while his brothers were accompanied by them when hunting and fishing.[1]

The *landvaettir* seem not always to be very clearly distinguished from the *fylgjur* of individuals; *e.g.*, in the *Saga of Olaf Tryggvason* (*Heimskringla*), 36, it seems to be suggested that the *landvaettir* of Iceland seen by the wizard are connected in some way with the great chiefs of the land. The word *vaettr* (pl. *vaettir*) is identical with A.S. *wiht*, 'creature,' etc., although the latter has not the specialized meaning of Old Norse. For the idea itself we may refer to the *genius loci* of the Romans.

9. Yggdrasil's ash. — Our information for Yggdrasil's ash is mainly derived from *Völuspá*, 19, 20, 27, and *Grímnismál*, 29–35. References also occur in *Fjölsvinnsmál*, 13–18. From *Völuspá* we learn that the ash Yggdrasil stands ever green over the well of Urthr ('Fate'), and from it falls dew into the vales beneath. Under this tree dwell the three norns. In *Grímnismál* not only do we learn that the *aesir* go daily to the judgment-seat under the ash, but we are given many details about its appearance.

It has three roots stretching in three directions. Hel dwells under one, the frost-giants under a second, and under the third the children of men. Its branches are the home of an eagle, a hawk, and a squirrel Ratatöskr, who bears messages to Nithhöggr dwelling below. Four harts gnaw the topmost branches, and many are the serpents which lie under its boughs.

In *Gylf.* 15 f. Snorri adds that in the spring of Fate dwell two swans, from whom are sprung all birds of that race, and also from the branches of the ash drops dew called 'honey-dew,' on which bees feed. The ash is sometimes called Yggdrasil, Askr Yggdrasils. Laeráthr, Mjotvithr, and Mímameithr seem to be names for the same tree. In both *Grímnismál* and *Fjölsvinnsmál* we have indications that the ash is being gradually destroyed; a hart bites it from above, it rots in its side, and Nithhöggr gnaws it from beneath. And, according to *Völuspá*, 47 f., when the last days come, it will shiver and groan. The golden foliaged Glasir which stands by 'Sigtyr's halls'[2] is perhaps to be identified with it. One other striking passage must be mentioned—*Hávamál*, 138, in which Othin is described as hanging on that tree of which no one knows from whose roots it proceeds.

A similar conception to that of a world-tree is certainly to be found among other Teutonic peoples—*e.g.*, among the Old Saxons, who worshipped the Irmensul. Several features in Adam of Bremen's description of the tree beside the temple of Upsala also recall Yggdrasil's ash.[3]

ii. NATURAL THINGS VIEWED MYTHOLOGICALLY.—**1. Day and night.**—From references in *Vafthrúthnismál*, 13, 25, Night, the daughter of Nörr, is depicted as driving across the sky her chariot and horse Hrímfaxi, from whose bit falls the spume which makes the dew in the valleys. Of Day we are only told that he is born of Dellingr. In *Gylf.* 10 Snorri gives further genealogical details.[4] In *Alvissmál*, 30, is given a list of names by which Night is known among the *jötnar*, elves, and gods. In the document *Hversu Noregr Bygthist* we find a genealogy traced back to Swan the Red, son of Dagr, son of Dellingr, and of Sól, daughter of Mundilfari. For the personification of Night and Day, we may compare

Greek mythology, especially the allusions to the chariots of the Sun and the Moon.[1]

2. Sun and moon.—For these see art. SUN, MOON, AND STARS (Teutonic and Balto-Slavic).

3. Rainbow.—To the old Norse people the rainbow was the bridge built by the gods to span the space between earth and heaven. Bifröst or Ásbru was its name, and it was triple-hued. Though it is made with cunning and of great strength, Snorri tells[2] that the day will come when it shall be broken. This bridge is referred to as Bifröst in the Older Edda, though it is not explicitly identified with the rainbow. In *Gylf.* 27 Heimdallr is named as guarding it against the frost and cliff giants.[3]

4. Winds and seasons.—In *Vafthrúthnismál*, 27, 37, references are made to the winds and seasons. The winds, according to the poet, arise from beneath the wings of the giant Hraesvelgr, who sits at the end of heaven in the likeness of an eagle. In *Vafth.* 27 Vindsvalr is said to be the father of Winter and Svasudhr of Summer. In *Gylf.* 18 f. Snorri gives further details, explaining that the difference between Summer and Winter is to be accounted for by the difference of parentage, for each has inherited the disposition of his father.

5. Thor.—In the preceding paragraphs we have been dealing with mythological conceptions which are scarcely distinguished from the natural bodies or phenomena which have given rise to them. There can be no doubt, however, that other mythological conceptions originated from similar phenomena in early times, though their identity with these was subsequently forgotten. Thus the name of the god Thor is identical with the word for 'thunder' preserved in English and German. The identity was practically forgotten in Norse owing largely to the fact that the word had gone out of use, but it is clearly preserved in Adam of Bremen's account of the Upsala sanctuary, where he speaks of Thor, 'qui tonitrus et fulmina . . . gubernat.'[4] We may refer also to the 'malleos joviales' which were carried off by the Danish prince Magnus on one of his raids among the Swedish islands, and which, according to Saxo,[5] had been venerated as symbols of thunder.

In English and German the name of the god is not distinguished, and consequently with the small evidence at our disposal it is not always clear which of the two was meant. The thunder-god (especially personifications of thunder) is of course wide-spread among the people of Europe. It is sufficient here to refer to the Taranis of the Celts (whose name appears to be identical with that of the Scandinavian Thorr), Jupiter Tonans of the Romans, Zeus Keraunios of the Greeks.

6. Othin.—Many writers hold that Othin originated in a personification of the wind. This view is largely bound up with the association of the god with the raging host, the antiquity of which is not very clear. The name Woden itself, which seems originally to have meant 'inspired or frenzied,' hardly furnishes a parallel to the case of Thor.

7. Jötnar.—It has been supposed by many writers that not only gods but also *jötnar* largely owe their origin to personification of natural phenomena. The *hrímthursar* ('frost-giants') indeed, of whom we often hear collectively, can hardly be of other origin. The friendly *jötunn* Aegir is very closely associated with the sea, for which his name is often used in poetry. There is some reason also for suspecting that Thrymr, the *jötunn* who steals Thor's hammer, may originally have been a counterpart of Thor, a rival thunder-god. It has been proposed by some that the *eoten* Grendel in *Beowulf* arose from a personification of storm-floods, but this explanation is open to the objection that the story is clearly based on an early folk-tale, the original locality of which has not yet been determined. If the *jötnar* in general had been derived from the personification of natural phenomena, one would expect to find an obvious meaning for their names, as in the case of Thor and perhaps of Thrymr, but as a matter of fact the etymology of the majority of their names is quite obscure.

According to another view, which has obtained more currency in recent times, the *jötnar* largely represent the communities of a more primitive race or civilization. This view also can be justified in some cases by the records. The giant Hrungnir fights against Thor with a hone, which may perhaps represent a stone hammer, and the word *berg-búi* ('cliff-dweller') points in the same direction. In some stories, as in the case of Grendel, the *jötnar* have cannibal propensities, and for this practice there is thought to be evidence in the way human bones are found mixed with those of animals in some caves. We may note also that the name Heithr is sometimes applied to witches of 'Finnish' (Lappish) origin, while in *Hyndluljóth* Heithr is said to be the daughter of the *jötunn* Hrungnir.

Occasionally also the word *jötunn* is applied in some MSS to persons also described as *Finnar*, as in the case of Swasi, father-in-law of Harold the Fair-haired. In the genealogies given in a document *Hversu Noregr Bygthist* some connexion is hinted at between *Finn* and *jötunn*. With the evidence at our disposal we are not yet in a position to determine their origin. It has been suggested also that the *dvergar* may be derived from communities of more primitive inhabitants.

8. Nornir.—The *nornir* bear so close a resemblance to the *völur*[1] ('wise women'), not infrequently mentioned in the sagas, that there can be little doubt that they are at least partly derived from them. Sometimes indeed the words *norn* and *völva* are used interchangeably.

9. Valkyrjur.—It is not unlikely that the *valkyrjur* have a similar origin. Sometimes the name is applied to human beings endowed with supernatural powers, as, *e.g.*, to Svava, the heroine of *Helgakvitha Hjörvarthssonar*, and to Sigrun in *Helgakvitha Hunding-bana II.*, and to Sigrdrifa, a valkyrie who was punished by Othin for not carrying out his commands. And, as most authorities identify her with Brynhildr, the term is applied to the latter also. This conception of human valkyries is not confined to the North. For, in Wulfstan's *Sermo ad Anglos*, *waelcyrgean* are mentioned beside *wiccean*, among a list of bad characters, from which the country is said to be suffering.[2] It is more difficult, however, to explain how the conception arose. We hear of fighting women more than once in Saxo, and the human *skjáldmeyjar* in the *Atlakvitha* point perhaps in the same direction.

10. Kings.—Among other human beings we may notice especially kings who were credited with supernatural powers both during their lives and after death. Two of the legendary kings of Sweden, Dómaldi and Olaf Trételgja, are said to have been put to death owing to bad harvests for which they were held responsible.[3] This belief lasted down to late times, since Gustavus Vasa is

said to have complained that the Swedes blamed him for bad weather. Nor was it peculiar to the North. According to Ammianus Marcellinus, xxviii. 5. 14, it was customary among the Burgundians to depose their kings in time of famine as well as after military disaster.

11. The dead.—Norse literature shows by constant reference that to the dead were attributed supernatural powers. Among those most commonly referred to is that of bringing prosperity and abundant harvest.

In *Ynglinga Saga*, 12, the god Freyr is said to die, but his death is not announced to his subjects the Swedes. His dead body was preserved that prosperity might abound in the land. A similar story is told about Halfdan the Black, for his body after death was cut in four pieces, which were buried in different parts of the kingdom, so that all sections of the land might have plenteous years.[1] A similar belief underlies the story of Olaf Geirstatha-alf,[2] and that of Guthmundr,[3] who after death was thought by his people to be a god, and was therefore worshipped. Yet another example is to be found in *Landnámabók*, i. 14, where Thórólfr Smjörr is mentioned as being worshipped after death. A curious instance of worship of the dead occurs in *Kristni Saga*, 2, where the missionary Thorvaldr is taken by a heathen Kodran to see a stone in which the ancestor (*ár-maðr* or *spá-maðr*) of the latter is said to have dwelt for a long time. Kodran averred that, when the missionary had sprinkled the stone with holy water, his ancestor had come out and complained that the water had scalded his little children.

12. Yggdrasil's ash.—This is a very complex conception, as may be seen from the variety of phenomena attached to it.[4] The descriptions indeed are hard to visualize and are apparently inconsistent. Sometimes the ash seems to spread out over the whole world; sometimes again it is represented as a definite locality to which the gods ride or walk to hold their court. If the tree called Laeráthr in *Grímnismál*, 25 f., is to be identified with the ash, as seems probable, it must be regarded as standing very near to Othin's hall. Now it was, and indeed still is, the custom for country houses in the North, especially in Sweden, to have standing by them a tree known as *vårdträd* ('protecting tree'), on which the welfare of the house is supposed to depend. Such trees were doubtless regarded as especially sacred in heathen times, and it is not unreasonable to suppose that the original conception of Yggdrasil's ash may have been that of a *vårdträd* of the divine community. In *Völuspá* the reference to the ash seems to point to a tree on which the destiny of the gods depends rather than to an all-comprehending world-tree. That its origin is to be found in actual trees is rendered probable by the Irmensul, which likewise was all-comprehending ('universalis columna . . . quasi sustinens omnia'),[5] for this was a real tree, or rather a tree-trunk, in spite of the property assigned to it. Further, the adjuncts mentioned in *Grímnismál* and *Gylfaginning*—the harts, snakes, etc.—link it with grove sanctuaries. We may refer particularly to those of the Lithuanians and Prussians, especially to the sacred one at Romove. It was forbidden to injure any birds or animals in such groves. The description indeed of the sacred oak at Romove furnishes an interesting parallel to Yggdrasil's ash from real life. In the North itself we can find parallels for all the features involved; *e.g.*, snakes seem to have disappeared from the Northern sanctuaries before the date of our records, yet a very interesting analogy in some respects is furnished by the description of the sacred tree at Upsala in scholium 134 to Adam of Bremen's *History*.

III. *WORSHIP.*—The Teutonic festivals are treated separately under the heading FESTIVALS AND FASTS (Teutonic). There are also separate articles on SACRIFICE (Teutonic) and HUMAN SACRIFICE (Teutonic). The various superstitions are covered under the headings DIVINATION (Teutonic), MAGIC (Teutonic), and ORDEAL (Teutonic). It remains in this section to speak of prophecy and the priesthood.

1. Prophecy.—According to Tacitus, *Hist.* iv. 61, numbers of women among the Germani were considered to possess the gift of prophecy 'in consequence of which many were revered as goddesses,' though he denies elsewhere[1] that the veneration paid to them was so great as this. One of the chief of these prophetic women was known as Veleda, a prophetess of the Bructueri, who ruled over considerable territory. To increase the honour in which she was held, she lived at the top of a high tower, and questions and oracular responses were conveyed between her and the public by a near relative 'like a messenger who had converse with the gods.'[2] The name Veleda, strictly speaking, does not appear to be a proper name but a Gaulish word for 'prophetess.'[3] We may here mention the story of the older Drusus, who in his last campaign was met on the banks of the Elbe by a woman taller than human who prophesied to him the manner of his death even as it afterwards came about.[4] According to Strabo,[5] the Cymbri had prophetesses who practised divination with slaughtered prisoners.[6]

2. Priesthood.—(*a*) *Priest.*—(i.) In Norway, and especially in Iceland, the duties of the priest were performed by the political leader of the people. During the colonization of Iceland the more important of the chiefs who went out from Norway built their own temples, not infrequently of the wood of which their temples had been made in Norway.

Thus we read in *Eyrbyggja Saga*, 4, that Thórólfr of Mostr built a temple to Thor of such wood. To this temple all the men in his own district had to pay a tax called 'temple-toll'; but the chief himself paid for the upkeep of the building and performed all the necessary duties in connexion with the temple and the temple services, while at the same time exercising judicial authority over the people of the neighbourhood. Again in *Hrafnkel's Saga Freysgóða*, 2, we are told that Hrafnkel raised a great temple in Athalból, where he 'made offerings to Freyr of the half of all the best things that he had.' Hrafnkel settled the whole of the valley and gave land to people on condition that he should be regarded as their chief and exercise the authority of priest over them.[7]

The priest was called *góthi*, and his office *gothorth*. In each *gothorth* was a consecrated place set apart for the *thing* (gathering of the people). Small settlers who were not of sufficient substance and authority to build temples of their own joined one or other of the *gothorth* so as to have the benefit of the temple services and the temporal protection of the *góthi*. So inseparable was the political function from that of the priest in Iceland that the *gothorth* formed the starting-point for the foundation of the constitution of Iceland. The title of *góthi* continued in existence after the adoption of Christianity, although now it had lost all religious significance and meant no more than magistrate (*lögsögumathr*). It is interesting to observe that the *gothorth* was a hereditary office and could even be bought and sold like any other property.[8]

This combination of priestly with secular authority existed also no doubt in Norway, whence the original priests of Iceland came, though—and here is a difference from Iceland—the power of the

[8] Cf. *Vatnsdœla Saga*, 41 f.; *Bandamanna Saga*, 3

local chiefs in Norway was subordinate to that of kings. The word *góthi* is occasionally applied to local chiefs—*e.g.*, to Thorhaddr the Old, who was *hof-góthi* at Maeren in Trondhjem [1]—and on several occasions we hear of priests in Iceland who had formerly possessed temples in Norway. The *Saga of Hákon the Good* (*Heimskringla*), 16, gives an account of a great sacrificial feast at Hlathir of which Earl Sigurthr sustained the whole cost himself; and from the *Saga of Olaf Tryggvason* (*Heimskringla*), 75, we learn that it had been the custom of Olaf's predecessors to offer sacrifice in Trondhjem. In poetry we sometimes meet with such expressions as *vörthr véstalls* ('guardian of the altar') applied to kings of the past. In all cases, here as in Iceland, it is clear that no exclusively priestly class existed, and that priestly duties were in all cases combined with temporal power.

For Denmark very little evidence is available. On three Runic inscriptions found in Fyn, and dating approximately from the 9th cent., the word *kuthi* (i.e. *góthi*) is found in combination with some proper name to form a compound word. Hróulfr and Ali are said to have been *nuRakuthi* (*Nora-góthi*) and *sauluakutha* (*Sölva-góthi*) respectively. It has been suggested that Nori and Sölvi are the names of men; but it seems at least equally probable that they are place-names.[2] If this is so, Hróulfr and Ali may have been local chieftains, like those on the west coast of Norway. It is significant that Saxo, who frequently refers to the laws and customs of heathen times, makes no references to a priestly class in Denmark.

For Sweden the evidence is more abundant. Adam of Bremen states in connexion with the great temple at Upsala:

'Assigned to all the gods they have priests to present the sacrifices of the people.'[3]

It does not necessarily follow perhaps from this statement that the duties of these persons were of an exclusively priestly nature. Elsewhere the evidence seems rather to point to a union in Sweden, like that in Norway and Iceland, of priestly duties with secular authority.

Thus we read in *Ynglinga Saga*, 47, that a famine which arose in the days of the legendary king Olaf Trételgja was attributed by the people to the king's remissness in offering sacrifices; and even towards the end of the 11th cent. we read in *Hervarar Saga, ad fin.*, of one Blótsveinn ('sacrificing-Sveinn') obtaining the throne in virtue of his promise to offer sacrifice on behalf of the people, which he actually carried out. Rimbertus[4] describes the formal deification of the Swedish king Ericus; and it will be remembered that the native dynasty, the Ynglingar, traced their descent from the god Freyr.

Thus, while the evidence is perhaps less direct and convincing for Sweden than for Norway, it seems on the whole to indicate a close union from the earliest times between secular and religious power.

(ii.) Except in Tacitus references to priests among the Teutonic peoples are of rare occurrence. In later times we read in the *History* of Ammianus Mercellinus[5] that the priests of the Burgundians were presided over by a chief priest who held his office for life. Jordanes[6] states that the priests of the Goths were of noble extraction.

(iii.) We learn from Bede[7] that the priests of the ancient English were forbidden to bear arms and to ride except on mares. Heathen priests are also referred to,[8] perhaps the most interesting instance being that of Coifi.

Eddius,[9] in his description of the shipwreck of Wilfrid off the Sussex coast, refers to the 'princeps sacerdotum idolatriae' standing before the country-people on a high mound and by his magic arts seeming to cast fetters on the hands of the people of God.

(iv.) Among the Teutonic peoples of the Continent in ancient times the priest seems to have combined to a great extent spiritual with temporal powers. According to Tacitus, his duties were threefold: (1) the consultation of omens on public occasions, together with divination, the casting of lots, and the observation of the sacred horses;[1] (2) duties in connexion with the tribal assembly such as the proclamation of silence at the opening of the meeting, and the administration of punishment at the assembly and in time of war;[2] (3) the guardianship of the sacred groves, symbols, and other holy objects,[3] which they also carried with the host to battle.[4] They no doubt had duties also in connexion with the public sacrifices. Indeed it may be said that their functions as a whole were essentially of a public character. There is little or no trace of any mystical relationship existing between the priest and the god, or of any peculiarly spiritual qualification in the priest such as we find noted, *e.g.*, in the case of prophetesses like Veleda, or in the account of the Druids given by Diodorus Siculus.[5]

(*b*) *Priestess.*—(i.) In Iceland the word *gythja* ('priestess') occasionally occurs,[6] and seems to be applied to women belonging to the ruling families of Iceland (*i.e.* those who held *gothorth*).

In *Kristni Saga*, 2, we are told of a woman Frithgerthr who was 'in the temple offering sacrifices' while Thorvaldr was preaching the Christian faith hard by. The term *gythja*, however, is not applied to her, and it is possible that she was only acting as deputy for her husband, who was absent at the *althingi* ('general assembly'). Mention is made in *Vápnfirthinga Saga*, 10, of a woman called Steinvör, who is described as a *hof-gythja* ('temple-priestess') and who owned a *höfuth-hof* ('public temple') and claimed temple-toll. When she wished to enforce the civil authority of the *gothorth*, she was obliged to apply to her kinsman Brodd-Helgi for help. But that she was conscious of her full religious responsibilities seems to be borne out by the amusing account given in *Kristni Saga*, 5, of a 'flyting' between Thangbrandr the priest and one Steinvör, the mother of the poet Ref, who is without doubt to be identified with the *hof-gythja* of *Vápnfirthinga Saga*. Here we are told that, after she had preached heathenism to Thangbrandr at some length, she made the startling announcement that 'Thor challenged Christ to fight in single combat; but he dared not fight against Thor!'

Beyond this, references to priestesses in the old Scandinavian countries seem to point to persons of a different character, though these references are not very satisfactory.

In *Sturlaugs Saga Starfsama*, 18, we are told of 60 *hof-gythjar* in a temple, which, however, was Finnish. Again in *Ynglinga Saga*, 4, we are told that the goddess Freyja was a *blót-gythja* ('sacrificial priestess'), and that after Freyr's death she kept up the temple and sacrifices at Upsala.

Here also we may mention the story of Gunnarr Helmingr, who is related in ch. 278 of the *Saga of Olaf Tryggvason* (*Flateyjarbók*) to have personated the god Freyr after destroying his idol. Freyr's image was kept in a temple in Sweden, and his shrine is said to have been attended to by a young and beautiful woman who was known as his wife, and with whom he used to make an annual progress through the land, driven in a chariot. This person is not actually called a priestess (*gythja*), but at all events she apparently had charge of the sanctuary and interpreted the answers of the god. We may here compare the account of Freyja, who in *Ynglinga Saga*, 18, is said to have upheld the sacrifices at Upsala after the death of Freyr.

(ii.) We have no definite evidence for the existence of priestesses in the strict sense of the term among the other Teutonic peoples. Tacitus speaks of 'numbers of women of prophetic power,'[7] but these recall the *völur* rather than the priestesses of the North. The former existence of a priestess may, however, perhaps be inferred from the account of the sacred grove of the Nahanarvali, which is said[8] to have been under the charge of a priest 'muliebri ornatu.'

IV. *TEMPLES AND SANCTUARIES.*—(*a*) *Iceland.*—(i.) In Iceland the temples formed centres of jurisdiction, one belonging to each of the 39

1 In the last duty he was accompanied by the king; cf. *Germ.* 10.

gothorth. One of the fullest descriptions of such temples which we possess occurs in *Eyrbyggja Saga*, 4.

Here we are told that Thórólfr of Mostr set up a great temple to Thor by Thor's river. There was a door in the wall near one end. Inside stood the high-seat pillars containing the pegs which were called *reginnaglar* ('holy pegs'). On one of these pillars the image of Thor was carved.

'The interior of this temple was a very holy place. At the end of the temple farthest from the door there was an annexe like the choir of a church at the present time, and there in the midst of the floor stood a *stalli* which served as an altar, and thereon lay a jointless ring weighing twenty ounces on which all oaths are said to have been sworn. The priest wore this ring upon his arm at all assemblies. On the *stalli* stood also the sacrificial bowl wherein was a *hleitteinn* which served as a sprinkler, wherewith was sprinkled the blood from the bowl which was called *hlaut*. That was the blood which was shed by such creatures as were sacrificed to the gods. In the annexe round about the *stalli* were the gods ranged. To this temple all men had to pay tribute, and they were under an obligation to accompany the temple priests on all such journeys as *thingmen* now take with their chiefs, and the *góthi* kept up the temple at his own cost so that it should not fall out of repair, and in it he upheld the sacrificial feasts.'

Some additional details are furnished by the descriptions of the temple at Kjalarnes in *Kjalnesinga Saga*, 2, 4.

This temple was 60 ft. in breadth, and, like the one built by Ingimundr in Vatnsdaela,[1] 100 ft. in length. Thor was the god most honoured in this temple. The inner sanctuary was circular like the hull of a ship. Thor stood in the midst of it, and other gods on both sides. In front of them stood a *stalli* made with great skill and covered with iron. On it there was a fire which was never allowed to die down. They called it the 'consecrated fire.' On that *stalli* there lay also a great 'ring' of silver. The temple priest wore it on his arm at all assemblies. Men took their oaths on it in all law-suits. On that altar there lay also a great bowl of copper into which was poured the blood which came from the cattle which were sacrificed to Thor or from the men. This blood they called *hlaut*, and (the bowl they called) *hlaut-bolli*. Men and cattle were sprinkled with the *hlaut*, but the cattle which were sacrificed there were used for entertaining the company when sacrificial feasts were held. And the men who were sacrificed were sunk in the pool which was outside by the door, and which was called *blótkilda* ('sacrificial spring'). The temple was surrounded by a wooden fence too high to climb, and both the temple and the fence contained doors that locked. Finally we are told that the beams of the temple were very excellent.[2]

Thorhaddr the Old, like many another, took the temple-mould and the high-seat pillars from his Norwegian temple and used them for his temple in Iceland.[3] We are also told that Jörundr *góthi* raised a temple in Svertingsstathir.[4] Numerous other instances might be cited.

In *Kristni Saga*, 2, heathen sacrifices are mentioned as being offered in a temple at Hvamm. In *Hrafnkels Saga Freysgótha*, 3, we are told that Hrafnkel raised a great temple to Freyr in Athalból. This temple stood on a rock above a deep pool in the river and contained images of the gods which had some kind of robes or ornaments upon them. A temple dedicated to Freyr is also mentioned in *Víga Glúms Saga*, 5, as being 'on the south of the river at Hripkelsstathir.'[5] In ch. 24 of the same saga we read that there were three temples on Eyjafirthr. In ch. 25 we have an interesting confirmation of the accounts of the oath-ring mentioned above. In the temple in Diupadale on Eyjafirthr 'whoever took the temple-oath took in his hand the silver ring which was reddened in the blood of the cattle sacrificed and which weighed fully three ounces.' Possibly the ring of Tomar (Thunor) which was carried off from Dublin by King Charles Malachy II. in 994 was one of the sacred rings upon which oaths were sworn.[6] Here we may compare the *Anglo-Saxon Chronicle*,[7] where the oath-ring is represented as the most binding form of engagement known to the Danes.

(ii.) Not only the temple itself, but also the land round about, was regarded as sanctuary.

Thus in *Eyrbyggja Saga*, 4, we are told that Thórólfr of Mostr held as sacred a hill in the precincts of his temple on Thorsnes. Here the *thing* of the men of the Western Firths was held. No one was allowed to turn his eyes thither unwashed, and no blood was to be shed there. Thórólfr's sons preserved the sanctuary inviolate as long as they could; and, when it had been defiled with bloodshed by the Kjalleklings,[8] the place was declared unhallowed and the *thing* removed to another part of the promontory, where the *dómhringr* is still pointed out to travellers—'That was one of the holiest of places.'

A curious tradition of sanctity is found in *Landnámabók*, ii. 16.

Authr the Deep-Minded was a Christian. 'She was accustomed to say her prayers at Cross-hills. She had crosses raised there, for she was baptized and a good Christian. Members of her family afterwards showed great reverence for that hill. A *hörgr* was made there when they began to offer sacrifices. They believed that they would pass into the hill when they died.'

(*b*) *Norway*.—(i.) From *Eyrbyggja Saga*, 3, we learn that, before Thórólfr of Mostr left Norway for Iceland, he had charge of Thor's temple on the island of Mostr, and was a great friend of Thor. The framework of this temple was transferred bodily to Iceland. Another island is mentioned in the *Saga of Olaf Tryggvason*[1] as containing a large temple dedicated to Thor. Guthbrandr of the Dales also possessed a temple dedicated to Thor.[2] His predecessor was a great friend of Earl Hákon of Hlathir. They had a temple in common in Guthbrandsdale, which contained figures of Thor and of Hákon's patron goddesses, Thorgerthr and Irpa. Thorgerthr is described as being as tall as a full-grown man and having a hood on her head. Thor was seated in his car, and all were adorned with clothes or ornaments and had gold rings on their arms. This temple and Earl Hákon's temple at Hlathir are said to have been the two chief temples in Norway.[3] When Earl Hákon first took possession of Norway, 'he commanded throughout his whole kingdom that the temples should be maintained,'[4] and later, when the emissaries of the emperor Otto had overthrown the temples of S. Norway, Earl Hákon caused them to be rebuilt and the heathen sacrifices to be re-established.[5]

Some interesting details of one of his temples (in Arkadale) are given in *Faereyinga Saga*, 23.

It stood in the midst of a wood and was surrounded by a paling and adorned with gold and silver, while the roof was lighted with several glass windows. Inside near the door was a figure of Thorgerthr Hölgabrúthr, beautifully adorned. The same story occurs in the *Saga of Olaf Tryggvason* (*Flateyjarbók*), 326, where we are told that Olaf stripped Thorgerthr of all her 'gold and silver and fine clothes' and dragged the idol at his horse's tail, finally beating it to pieces with a club and burning it along with the image of Freyr.

Olaf Tryggvason systematically destroyed Hákon's temples and despoiled the idols. He took from the door of the temple at Hlathir the large gold ring that Hákon had had made, and burnt the image of Thor which it contained.[6] In his missionary expedition to Inner Trondhjem he despoiled the temple at Maer, which contained many idols fixed on *stallar*, in the midst of whom sat Thor, 'an image of great size, all adorned with gold and silver.'[7] A curious and interesting account of a temple and image dedicated to Balder in the district of Sogn is mentioned in the *Saga of Frithjóf the Bold*.[8] It has been the custom to cast doubt on this evidence, but the details are not obviously fictitious, and it is difficult to imagine why they should have been invented. The account is at least as reliable as that of *Kjalnesinga Saga*,[9] which is usually accepted as probable.

(ii.) The word *hof* ('temple') frequently occurs in association with the word *hörgr*.[10] What exactly the *hörgr* was we do not know. From *Hyndluljóth*, 10, the *hörgr* seems to have been made of stones:

'He made me a *hörgr* built of stones. Now, this heap of stones is turned to glass.'

But in *Grímnismál*, 16, Njörthr is said to rule over *hótimbruthum hörgi* ('high-timbered *hörgrs*').

[1] Cf. *Vatnsdaela Saga*, 15.

[2] Here we may compare the story given in *Landn.* v. 12 of Ketilbjörn, who was so rich that he ordered his sons to make a cross-beam of silver in the temple which they were building on Mossfell. His sons, however, did not carry out his orders.

[7] *Ib.* 268. [8] Ch. 1 and *passim*. [9] Ch. 2, 4.

[10] Cf., e.g., *Helgakvitha Hjörvarthssonar*, 4.

The phrase '*hörgr* and *hof* high-timbered' occurs also in *Völuspá*, 7. It has been suggested that the word 'high-timbered' is merely conventional and that the *hörgr* was a stone structure as opposed to the wooden temples so common in Norway and Iceland. In *Örvar Odds Saga*, 29, we are told that Oddr 'burnt a *hof* and broke a *hörgr*'; but in the preceding verse both *hof* and *hörgr* are spoken of as being 'burnt.' *Hof* and *hörgr* are spoken of as burnt in ch. 165 of the *Saga of Olaf Tryggvason* (*Fornmanna Sögur*). But in ch. 141 of the same saga we are told that the king commanded '*hof* and *hörgr* to be broken and burnt.' The *hörgr* is frequently mentioned in connexion with women.

Thus in *Gylf.* 14 the goddesses are said to inhabit 'a *hörgr* which was a very fair house. It was called Vingólf.' In *Hervarar Saga*, 1, Starkathr is said to have carried off Alfhildr as she was in the act of reddening the *hörgr* by night after the great *dísarblót*. After the death of Authr the Christian, her relatives made a *hörgr* on the hill where she had set up her crosses.

The word is still traditionally connected with high places in popular speech. Thus, when the land lies deep in snow, the Icelanders say that 'only the highest *hörgar* jut out.' And in the Norwegian patois a dome-shaped mountain is called a *horg*. Perhaps the word is a survival of an older form of religion when places of worship were more primitive than the carefully constructed *hof*. It is obviously connected ultimately with the O.H.G. *haruc*.

(iii.) It will be seen that there are certain obvious discrepancies in regard to the use of the term *hörgr*. It appears in some cases to have been a cairn, but in others a building capable of habitation. Sometimes it is made of stone, in other cases perhaps of wood. The difficulty is increased by the fact that the word is obviously identical with the early German word *haruc*, which is used to gloss the words *nemus*, *lucus*, while the corresponding A.S. *hearg* is also perhaps used for 'grove.' Such sacred woods or groves were probably common in early times, since many place-names are compounded with the word *lundr* ('sacred grove'). Moreover, the usual name for the place of assembly in the North is *thingvöllr*, which must originally have meant 'wood of the assembly,' *völlr* being cognate with O.S. *weald* and O.H.G. *wald* ('forest').

The legendary sanctuary at Glasisvellir[1] was probably connected with a holy grove, and is no doubt identical with Glasir, the name of the tree by Valhöll, Othin's dwelling-place, mentioned in *Skáldskaparmál*, 34. It is in a forest clearing that the gods meet to decide the fate of Starkathr.[2] According to a mythological poem,[3] the gods meet every day to dispense justice under Yggdrasil's ash. Perhaps we may also instance Tomar's wood,[4] which was situated near Dublin. It has been suggested that this means 'grove of Thor.'

It is noteworthy that the two great assembly places, Frosta and Gaula, are both on peninsulas. Sacred islands may also have been known, as can perhaps be inferred from the recurrence of such names as Njardhrey, Vé-ey, Thorsey, and possibly Halogaland.

(*c*) *Sweden.*—(i.) The great temple of the Swedes was at Upsala.

'The Swedes have a most magnificent temple which is called Ubsola [Upsala] not far distant from the city of Sictona [Sigtuna]. In this temple, which is fitted [?] entirely with gold, they worship the statues of three gods. Thor, the most powerful of them, has his seat in the midst of the couch [?], while Wodan and Fricco occupy places on either side of him. . . . Wodan they represent as armed, just as our people represent Mars, while Thor with his sceptre seems to copy Jupiter.'[5]

'That temple is surrounded by a golden chain which hangs over the roof [?] of the building, and the gleam of which is visible to visitors at a distance; for the shrine itself stands on level ground with hills round it like a theatre.'[6]

(ii.) In the (contemporary) scholium 134 we have an interesting account of a holy grove which stood beside the temple, and which contained an evergreen tree of great sanctity.

'Near that temple there is a very large tree stretching out its branches afar and always green both in winter and summer. No one knows what kind of tree it is. There also is a spring in which it is the practice of the heathen to do sacrifice by sinking a living man in it. If he does not reappear, the prayers of the people will be fulfilled.'

The description of Yggdrasil's ash, which is said to overshadow Asgarthr,[1] is no doubt derived from the Upsala evergreen, as the description of the home of the gods is surely derived from some Northern sanctuary, in all probability the identical sanctuary at Upsala.[2]

There are many other references to this sanctuary in both Norse and Danish authorities, and it was in fact the most famous one in the North. In *Ynglinga Saga*, 12, and in Saxo, iii. 90, its establishment is attributed to the god Freyr, who in the former is represented as having lived and died at Upsala. This is no doubt also the scene of the story of Gunnar Helmingr, although in this story the place is not actually mentioned.

In *Jómsvíkinga Saga*, 12, we are told of a temple in Götland which contained 100 gods and also temple treasure and temple servants to offer the sacrifices, but, apart from the great temple at Upsala, we know little of the heathen temples of Sweden.

(*d*) *Denmark.*—No records of Danish temples appear to have been preserved. The chief sanctuary of the Danes was at Leire. This was no doubt a sanctuary of great antiquity. It is the home of the famous kings of the 6th cent., Hróarr and Hrólfr Kraki (the Hrothgar and Hrothwulf of *Beowulf*). In *Ynglinga Saga*, 5, it is said to have been the home of the goddess Gifjón and her husband Skjöldr, the eponymous ancestor of the Skjöldungar (A.S. Scyldingas), the Danish royal family. Like Upsala, the locality is remarkable for its barrows, some of which date from the earliest times.

The existence of ancient sanctuaries in the old Danish kingdom is also implied by some of the place-names; *e.g.*, Lundr, the name of the old ecclesiastical capital in Skáney, meant originally a 'sacred grove.' Cf. also Véborg (mod. Víborg; 'sanctuary town') and Helganes ('holy promontory') in Jutland; Óthinsé or Óthinsvé ('Othin's Sanctuary') on the island of Fyen, and Hlésey, besides many other Danish (and Norwegian and Swedish) place-names.

(*e*) *England.*—In England the worship of idols and the existence of heathen temples were well known to Bede. In A.D. 601 Pope Gregory sent a letter to the abbot Mellitus urging that, while he is to destroy the idols in England, he is to leave the heathen temples standing that they may be consecrated for purposes of Christian worship. He says expressly, 'It is their custom to slay many oxen in sacrifice to devils.'[3] The East Anglian king Redwald, who had been converted to Christianity on a visit to Kent, is said to have had in the same temple an altar for Christian worship and an *arula* at which to offer victims to devils;[4] and his son Earconberct is said to have been the first of the English kings who commanded the idols throughout his country to be destroyed.[5] When the Northumbrian Council decided to adopt Christianity, the high priest of the heathen, Coefi, rode to the sanctuary of Gudmanum on the Derwent, cast a spear into it, and commanded his companions to destroy and set fire to it with all its precincts.[6] References of a historical character to sanctuaries in this country are rare, however. But such place-names as Thunresleah, which must originally have

1 Cf. the *Tháttr af Nornagesti*, 1; *Hervarar Saga*, 1.
2 Cf. *Gautreks Saga*, 7. 3 *Grímnismál*, 30.
4 Mentioned in the *War of the Gaethil with the Gaill*, 113.
5 Adam of Bremen, iv. 26. 6 *Ib.* scholium 135.

1 *Gylf.* 15. 2 Cf. also *Skáldskaparmál*, 34.
3 *HE* i. 30. 4 *Ib.* ii. 15.
5 *Ib.* iii. 8. 6 *Ib.* ii. 13.

meant 'grove of thunder,' perhaps indicate the existence of groves sacred to the thunder-god among the ancient English, and there are other reminiscences of heathen worship no doubt preserved in such place-names as Thunresfeld and Wednesbury.

In *Beowulf*, 175, we hear of offerings made *aet haergtrafum*, which perhaps means 'shrines' covered with canopies. The word *haerg*, identical with Norse *hörgr*, is of frequent occurrence standing alone, and is used to translate various Latin terms such as *fanum*[1] and *idolum*. There are other passages in which the word seems to mean a 'grove,' as in German, and it is not uncommon in place-names—*e.g.*, Harrow. A number of other words which appear in Christian usage were presumably applied at first to heathen sanctuaries—e.g., *weofod* ('altar').[2]

(*f*) *The Continent.*—(i.) References to temples on the Continent are rare. In the 6th cent. a Frankish temple was destroyed by Radegund, wife of Chlotar. Gregory of Tours describes a temple at Cologne which contained figures of the gods and in which sacrificial feasts were held. The Frisians seem to have had temples, but the notices are not always clear.

(ii.) The word *fanum*, by which these sanctuaries are usually denoted, is also used of the Irmensul, which, according to Thietmar of Merseburg,[3] was an immense wooden shaft or pillar worshipped by the Old Saxons in a place called Eresburg. According to the *Vita S. Alex.* 3, this pillar was 'set up aloft in the open.' In their own language they call it 'Irmensul, quod latine dicitur universalis columna, quasi sustinens omnia.' It was cut down in the year 772 by Charlemagne, who spent three days destroying the sanctuary and carried off much gold and silver.

Among the heathen practices of the Old Saxons condemned in the *Indiculus Superstitionum* and elsewhere we hear of sanctuaries connected with woods, of springs connected with sacrifices, and of various places which are venerated as holy.

The chief sanctuary of the Frisians was that of 'Fosite's Land.' According to Alcuin's *Vita S. Willibrordi*, 10, it took its name from the god Fosite.

'For *fana* of this god were "constructed" (*constructa*) on it.' This place was held so sacred by the country folk that no one dared to touch the cattle or anything else that fed there. He also mentions a sacred spring on the island.[4]

Adam of Bremen[5] identifies this land with the island of Heilgiland (Halogaland). In the *Vita S. Bonifatii*, 23, we read of a sacred oak of gigantic size, the *robor Jovis*, which was cut down by the saint amid the clamorous protests of the heathen.

There is no doubt that sacred trees and groves were of frequent occurrence among all the Teutonic peoples of the Continent. In the *Translatio S. Alexandri*, 3, we are told that the Saxons worshipped trees and streams. Claudian speaks of 'groves grim with ancient religious rites and oaks resembling barbaric divinity.'[6]

The O.H.G. word *haruc*, like the O.N. *hörgr* and A.S. *hearg*, presents some difficulty, being used sometimes to gloss *nemus*, *lucus*, sometimes *fanum*, *delubrum*. It has been suggested by Mogk that the lack of clear distinction between the terms for the natural and the artificially constructed sanctuary is due to the utilization of old sanctuaries as sites for later temples.

(iii.) References to Teutonic temples in earlier times, in the works of Tacitus, are rare and doubtful. In *Ann.* i. 51 it is stated that Germanicus razed to the ground the temple which they called the temple of Tamfana and which was most frequented by those tribes. Again, in *Germ.* 40 mention is made of the *templum* of Nerthus, but it is not unlikely that the word is used loosely for 'sanctuary'—'the holy grove on an island in the ocean,' the home of the goddess Nerthus, who visits the nations in a consecrated car covered with a garment.

'One priest alone is permitted to touch it. He is able to perceive when the goddess is present in her sanctuary and accompanies her with the utmost reverence as she is drawn along by cows. It is a season of rejoicing, and festivity reigns wherever she deigns to go and be received. They do not undertake hostilities or take up arms; every weapon is put away; peace and quiet are then only known and welcomed, until the goddess, weary of human intercourse, is at length restored by the same priest to her temple. Afterwards the car, the garments, and, if you are willing to believe it, the deity herself, are cleansed in a secret lake. This rite is performed by slaves who are instantly swallowed up by its waters.'

The indications given by Tacitus are too vague to enable the site of this sanctuary to be fixed with any certainty, but it is not impossible that it was the Danish sanctuary of Leire. In that case Nerthus may have lived on as Gifjón. Her name, however, is identical with that of the Norse god Njörthr.

According to *Germ.* 9, 'the Germani deem it to be inconsistent with the majesty of the gods to confine them within walls or to represent them after any similitude of a human face; they dedicate groves and woods and call by the names of gods that invisible thing which they see only with the eye of faith.'[1]

Sacred groves are mentioned by Tacitus in several other places. Arminius's forces assemble in a wood sacred to Hercules.[2] Civilis brings his army together in a sacred wood.[3] According to *Germ.* 43, the Nahanarvali had a grove of ancient sanctity. It was in these groves that they kept the sacred symbols.[4] Here also were reared the sacred white horses which were never allowed to do work for mankind, but were employed to draw the sacred cars, when their neighing was carefully observed by the priest and king of the state.

According to *ib.* 39, the Semnones had a wood of immemorial antiquity and holiness. Here on certain occasions there met embassies from all the kindred peoples (the various branches of the Suevi) to celebrate their barbaric rites by the slaying of a man. The grove was held in reverence, and no one was allowed to enter unless he was bound with chains to signify his own humility and the power of the grove.

Brodribb), London, 1877; Cæsar, *Commentaries on the Gallic War*, tr. T. Rice Holmes, do. 1908.

N. KERSHAW.

THAGS.—A secret organization of robber-stranglers called Thags existed for centuries in India, but it was put down by Lord William Bentinck's Government in the second quarter of the 19th century. Their history is full of incident and varied interest; here the religious and ethical aspects of the subject must be dominant.

1. Introduction.—The word *thag*, usually written *thug*, comes from a Sanskrit root *sthaga* meaning 'conceal,' which in the modern vernaculars becomes *thag* and means 'deceive.' The earliest reference to Thags comes from the middle of the 12th cent., and the first historical information about them from the end of the 13th cent.; but clear and full knowledge did not become available until the time when the organization was put down, about 1830. At that time there were thousands of Thags, well organized and extremely successful. They were all men of intelligence and capacity, most of them Hindus of good caste or respectable Muhammadans. Religion controlled their operations down to the last detail. How far back the fully organized confederacy reaches we cannot tell; but scattered fragments of information make it probable that in all essentials the conspiracy had been the same for several centuries.

2. Description.—Thags were ostensibly most respectable men, engaged in business, farming, or something else equally harmless. Their method was to start out in bands of from ten to two hundred in the month of October. They usually posed as merchants, but on occasion adopted other disguises, especially the dress and marks of ascetics. They possessed a secret vocabulary and a number of secret signs, which could be used without danger in the presence of outsiders. They travelled along or near the great roads used by merchants and money-porters, discovered which individuals or companies carried valuable goods or large amounts of gold and silver, and then with much skill and cunning contrived to win their confidence. They would then travel with them, it might be for days or even weeks, until time, place, and all else were favourable to their purpose, when, at a signal, they suddenly set upon the unsuspecting party, strangled them all in a few minutes, buried their bodies, distributed the booty, and decamped. They used a cloth in strangling their victims. Similar methods were practised on the rivers. One of the most extraordinary features of their history is the almost unbroken immunity which they enjoyed: it was only very rarely that a Thag was caught and punished for his crimes.

Thags believed their profession to be a religious duty, and all that they did was done under the sanction of religion. They were fully convinced that the goddess Kālī, the wife of Śiva, called also Durgā and Bhawānī, had commanded them to strangle and to rob, and had laid down all the rules which they followed in the course of their operations. Many Brāhmans were Thags; and, when there was a Brāhman member in a gang, he conducted the ceremonies. The neophyte, whether the son of a Thag or a new accession, was initiated in an impressive religious ceremony, and took a dread oath of absolute fidelity to the brotherhood. Before starting on the season's operations each gang met in a suitable place, and took part in a solemn act of worship. As soon as possible after every successful operation another religious ceremony was carried out. Once in seven days at least the goddess was worshipped, and on the greater occasions animals were sacrificed in her honour. They would not start on a journey, admit a new member, or decide upon an act of murder, unless the goddess granted them favourable omens. In every ceremony she was worshipped, and to her their prayers were offered. No image was used; but the pickaxe for digging the graves of their victims, solemnly consecrated, stood for the goddess, and was believed to be filled with her power and inspired by her to guide them. In every ceremony the offerings of *gur* (*i.e.* coarse sugar) and water were made to the pickaxe; over it every oath was taken; and at all times it was regarded with extreme reverence, confidence, and fear. On every occasion when *gur* and water were offered to the pickaxe, every fully qualified Thag also ate of the *gur* and drank of the water. At the close of each period of operations a percentage of the gains was solemnly presented to the goddess in one of her temples.

Among the rules which guided the Thags perhaps the most noticeable was the law that they must never strangle a woman.

3. Sources of the system.—The religious and political conditions of mediæval India provided the soil and the seed from which this extraordinary organization grew. The following facts require to be realized.

(*a*) In all parts of India to-day there exist criminal tribes,[1] *i.e.* tribes whose regular caste-occupation is some form of crime. In each case there is a belief that some divinity has imposed on the tribe the particular type of crime which it practises and has also laid down the rules under which it is followed. It is therefore the duty of every member of the tribe to make the practice of the crime his regular occupation, and to obey all the religious rules which are laid down for his guidance in it. So long as he does so, he regards himself as a religious man. A percentage of the gains is regularly dedicated to the god or goddess who gave the tribe its criminal profession. A few of these tribes profess Muhammadanism, and dedicate their gains to some *pir* (Muhammadan saint); but they are probably old criminal tribes which have undergone a shallow conversion to Muhammadanism. Criminal tribes are primitive people of very low social standing.

(*b*) All the chief forms of Hindu theology declare that the Supreme is exalted far above the petty distinctions of human

1 J. N. Farquhar, *Modern Religious Movements in India*, New York, 1915, p. 424.

morality. The idea is to make Him truly absolute, to sever Him in the most decisive way, not only from the earthly and the sensual, but from all human conditions as well. Thus, from the very fact that in Himself He is completely separated from both good and evil, it becomes possible to acknowledge that He is indifferent to them and is equally the cause of both. Hence to suggest that God should bid men do what we call wrong seems to the Hindu to be not only quite natural but also inevitable.

(*c*) The Śākta sect of Hinduism, which worships the wife of Śiva, called Durgā, Kālī, Bhawānī, or simply 'the goddess' (Devī), and possesses a philosophical theology, falls into two sub-sects—the Right-hand and the Left-hand. The Left-hand sect has a cult which contains several extraordinary features. Only one need be mentioned here, viz. that for many centuries not only animal but also human sacrifice was offered. In 1835 the British Government prohibited human sacrifice, but until then it was common in the chief shrines of the goddess in North and Central India. According to the ritual law, only males can be sacrificed to her.

(*d*) In the worship of the goddess in the homes of the people, pots, pieces of metal, and diagrams are more often used than images; and both images and symbols, when duly consecrated, are believed to be filled with the presence and power of the goddess.

(*e*) In modern India there are many groups of ignorant Muhammadans who take part in Hindu worship. They not only join in the great festivals, but also visit Hindu temples and make offerings to the gods, in order to secure immunity from disease and to obtain other boons. Muhammadans of a low type thus readily adopt elements of the Hindu cult.

These facts enable one to realize that, in mediæval India, there might readily appear a community organized on the basis of the worship of the goddess and the practice of murder and robbery. At first it would differ but little, if at all, from an ordinary criminal tribe; and the first Thags would be ignorant Hindus who had been worshippers of the goddess before they formed the society to strangle and rob unwary travellers. To pass from participation in human sacrifice before the altar of the goddess to the search for victims for her on the high roads would be no violent change. Nor would even the thoughtful Hindu be shocked by the doctrine that the goddess had ordered the programme of murder. Hindu theology provides a substantial basis for the idea. Further, the fundamental document on which the worship of the Devī rests[1] is full of blood and horror. The story in that document of her struggle with a demon named Raktabīja and her final triumph over him was made by Thags the starting-point of the tale in which she commands the original Thags to strangle men.[2] The ritual law that only males should be sacrificed to her is clearly the source of the rule that Thags must not kill women. It would also seem quite natural to devotees of the goddess to use the pickaxe as a symbol instead of an image, and they would instinctively believe that the power and the will of the goddess were present in it.

Nor need we wonder that Muhammadans, in order to become Thags, were willing to participate in Hindu worship, since so many are to-day accustomed to supplement Muslim rites with the cult of Hindu divinities.

(*f*) India has usually been ruled, not by one Imperial Government, but by a multitude of petty states, each of which sought only to secure peace and order within its own narrow territory, and cared little or nothing for what happened outside. Nor has the individual Indian ever felt it to be his duty to go out of his way to secure the well-being of the Indian people as a whole. If, therefore, some of the subjects of one of these small states pursued a certain type of crime outside the limits of the state and brought back large gains, whereof they gave considerable percentages to the Government, on the one hand, and to the temples, on the other, both Government and people were usually only too willing to acquiesce in the arrangement, and to do all that was possible to protect the men who brought them so much prosperity.

These and similar facts account for the almost universal immunity which the Thags enjoyed. They were found all over India, were closely bound to one another by oath and interest, and were usually only too well able to take prompt vengeance on any who molested the brotherhood.

[1] *I.e.* the Chaṇḍī episode in the *Mārkaṇḍeya Purāṇa*.
[2] Sleeman, *Ramaseeana*, p. 127.

Thus only an Imperial Government using wide powers could successfully grapple with them.

4. **The rise and fall of Thagī.**—It seems clear that the Thag conspiracy was originally a Hindu organization, as we have already suggested, and that it came into being before the Muhammadan conquest of North India (1193–1293). In his *Śrīkaṇṭhacharita* the Hindu poet Maṅkha or Maṅkaka (fl. *c.* A.D. 1150) compares the thievish spring to a Thag.[1] Clearly by his time the community was already well known.

If the community was very successful, it would soon attract indigent Hindus of high caste, and there would be plenty of poor Brāhmans who would be eager to enter. It seems probable that, after the Muhammadan conquest, during one of the many periods when anarchy was wide-spread, the stranglers found unusual opportunities for their depredations, and waxed so rapidly rich that many Muhammadans became Thags and readily acquiesced in the established cult of the goddess. The great success and the wonderful immunity from punishment which the movement enjoyed would be to them clear proof of its divine origin. There is conclusive evidence that Muhammadan Thags looked back with great veneration to Nizām al-Dīn Awliyā, a famous Muslim saint, who lived at Delhi in the first quarter of the 14th cent., and that they regarded him as one of the founders of the system.[2] This fits in perfectly with our theory that, at some time after the conquest, numerous Muhammadans joined the community. It is probable that the event occurred about A.D. 1300. The story that Muhammadan Thags were all descended from seven famous tribes[3] may also have a historical root.

The confederacy lived and flourished for many centuries, and was still extremely prosperous at the moment when it had the ill fortune to attract the attention of the British Government in India. In 1829 special officers were appointed to investigate the system, and a serious campaign was started for the destruction of the whole organization. Within seven years the work was done. The success of this great effort is mainly due to the devotion and genius of Captain, later Major-General, Sir W. H. Sleeman.

5. **Religious and ethical character of the Thags.**—Those Europeans who had extended intercourse with Thags, during the period when the British Government were endeavouring to put the system down, gave very vivid descriptions of the kind of men they were.

(*a*) Every Thag was fully convinced that the goddess had created the system, and that she invariably saved Thags from punishment or disaster, so long as they obeyed the rules she had laid down for their operations. They were also immovably convinced that the consecrated pickaxe was so filled with the presence of the goddess as to be able to guide the Thags in their wanderings and to bring dire disaster on every one who disobeyed.[4]

(*b*) No Thag ever showed the slightest compunctions of conscience for his crimes. Sleeman writes:

'A Thug considers the persons murdered precisely in the light of victims offered up to the Goddess; and he remembers them, as a Priest of Jupiter remembered the oxen, and a Priest of Saturn the children sacrificed upon their altars. He meditates his murders without any misgivings, he perpetrates them without any emotions of pity, and he remembers them without any feelings of remorse. They trouble not his dreams, nor does their recollection ever cause him inquietude in darkness, in solitude, or in the hour of death.'[5]

Never did the strength of religious faith or the extraordinary domination which religion exercises over man's moral nature find clearer illustration.

THĀNESAR.—Thānesar (Skr. *sthāṇvīśvara*, *sthāṇu*, a local name of Śiva, *īśvara*, 'lord'; also *sthāṇeśvara*, *sthāṇa*, 'shrine,' and *īśvara*) is a sacred town in the Karnāl District of the Panjāb, lat. 29° 59′ N.; long. 76° 50′ E., on the banks of the river Sarasvatī (*q.v.*). The Chinese pilgrim, Hiuen-Tsiang, describes it under the name of Sa-t'a-ni-shi-fa-lo, as the centre of the Hindu Holy Land (Dharmakshetra, Kurukshetra) and gives the local legends.[1] It has been identified with the Ostobalasara or Batangkaisara of Ptolemy.[2] In A.D. 1014 it was sacked by Maḥmūd of Ghaznī.[3] The most famous shrine was that dedicated to Chakrasvāmi, Viṣṇu, 'lord of the discus.' The statue is said to have been taken to Ghaznī to be broken up and trodden under foot. It was finally desecrated by Aurangzīb. Enormous crowds of pilgrims visit the place to bathe at eclipses of the sun.

THEISM.—1. **Definition.**—The word 'theism' (Fr. *théisme*, Germ. *Theismus*) is a purely modern formation, implying a non-existent Greek *θεισμός* and an equally non-existent verb *θείζω* (on the analogy of *μηδίζω*, *φιλιππίζω*, and the like). As there is a certain vagueness about the meaning of the word in current English, it is necessary to begin this article with a convention as to the sense in which 'theism' will be employed in what follows. The word will be used throughout as a name for a philosophical theory as distinct from a practical religious faith. Perhaps the faith and the theory are never absolutely disjoined, but they are at least logically distinguishable. It may be doubted whether any man wholly untouched by the spirit of adoration and wholly devoid of love to God has ever been a genuine theist in philosophy, and again whether one can be in earnest with a philosophical belief in God without being led on to regulate his life by that belief. But it is at least possible to practise love of God and trust in God without making any conscious attempt to find a speculative explanation of the world. There are many who, in George Tyrrell's phrase, share the faith of Simon Peter without concerning themselves about his theology. The present article will be exclusively concerned with the philosophical conception of God as the ultimate ground of things. Current usage seems to require a further distinction. It seems necessary to discriminate theism not only from atheism (*q.v.*), the denial that God exists, and scepticism or agnosticism (*q.v.*), the refusal to answer any question about the ultimate ground of things, but also from deism (*q.v.*), which, in its way, also treats God as an ultimate ground. We shall probably not depart far from the implications of current language if we agree to define theism as the doctrine that the ultimate ground of things is a single supreme reality which is the source of everything other than itself and has the characters of being (*a*) intrinsically complete or perfect and (*b*), as a consequence, an adequate object of unqualified adoration or worship. Belief in a ground of things which is not intrinsically complete and perfect, and consequently no adequate object of adoration, but at best of respect and admiration, would at the present day probably be described by every one as deism rather than as theism. Thus the suggested definition in fact coincides with the famous formula of St. Anselm, that God is *id quo maius cogitari non potest*, 'the being than which none greater can be thought.'[1]

It is evident that theism, thus understood, is incompatible with polytheism (*q.v.*) and also with any doctrine, theological or metaphysical, which asserts a plurality of independent and equally ultimate 'reals,' whether in the form of a dualism between God, the good principle, and an immaterial evil principle (Zoroastrianism, Manichaeism [*qq.v.*]), or between God and matter, or in that of an ultimate plurality of unoriginated 'souls' or 'persons,' or in any other shape. All such doctrines involve the denial that there is any object which answers to the definition *id quo maius cogitari non potest*. For this reason the various modern theories of a finite or limited deity are inconsistent with strict theism. For a deity limited by restrictions arising outside his own nature is manifestly not the source of all reality other than himself, and thus not God in the sense in which we are using that word. And, if the 'limitations' are asserted to be self-limitations, due to the nature of God Himself (as in the philosophy of Hastings Rashdall), we have to face a dilemma. Either the presence of these limitations in the deity is a defect, and the deity is therefore not God in our sense at all, or their presence is not a defect, and there is then no sense in calling them restrictions or limitations, as it is their absence which would, in this case, be the defect.

It is mainly on the ground of alleged difficulties in the notion of the divine Omnipotence that these theories are recommended. But the difficulties seem due to misunderstanding. Omnipotence means only power to do whatever is consistent with God's own perfection. It is no real limitation of the divine power to hold, as most theologians and philosophers have done, that God cannot do what is in itself absurd—*e.g.*, cannot make a false proposition true, or make virtue vice, or annihilate Himself. The old Stoic boast that the sage is in one respect more powerful than God, because he can put an end to his existence if he grows tired of it, is a mere false paradox.

It is, perhaps, more important to be clear on the point that theism, as defined, is equally inconsistent with the type of philosophic monism called by James Ward 'singularism'—the theory that there is only one existent, the Absolute, and that this single existent is the true subject of all significant propositions. If we mean by God a being from whom all else that exists derives its being and who can be worshipped, then the belief in God necessarily implies belief in the real existence of beings who can worship God. To say that God is the source of existence implies that God is not all that exists. From a theistic point of view it is, no doubt, proper to call God, the being from whom all others are derived, the Absolute or unconditioned being, but only on the condition that the Absolute is not equated with all that really exists. The underived source of existence may, in virtue of its unique intrinsic completeness or perfection, be called the *ens realissimum*, but the very use of such a phrase implies that there are other *entia realia*.

It will probably be readily admitted that the ἓν καὶ πᾶν doctrine of Spinoza cannot be reasonably called theism, nor have the most distinguished representatives of singularism in

[1] S. Beal, *Si-yu-ki*, London, 1884, i. 183 ff.

[3] H. M. Elliot, *Hist. of India*, London, 1867–77, ii. 452 ff.

[1] *Proslogion*, ch. 2.

our own times shown any desire to claim the name of theists. It should be recognized that the popular language about a purely 'immanent God,' as opposed to the 'transcendent God' of orthodox Christian theology, is equally incompatible with genuine theism, inasmuch as it conflicts with the recognition of a real distinction between the supreme source of existence and the dependent existents. It is just this distinction which is vital in a theistic philosophy, and, for this reason, it may be taken as a fair test of the theism of a philosophy whether its way of conceiving the relation of its God to the world is compatible with a real recognition of the divine transcendence.

2. Philosophy and theism.—If we look at the history of European philosophy, it may be said that in the main the general trend of philosophic thought, even independently of the influence of positive religions, has been theistic, at least from the time of Plato to our own day. Even the agnosticism of Herbert Spencer, when all the qualifications with which it is enunciated by its author are taken fully into account, has a recognizable theistic tendency and might be said, apart from its blunders about dynamics, to be little more than a very crude reproduction of the 'negative theology' which is really one-half of the orthodox Christian doctrine of God. As will be shown directly, this tendency to theism is a direct consequence of the permanent influence of Plato on all subsequent developments in philosophy. Apart from materialism (*q.v.*), which has never produced a philosopher of the first rank, the main antitheistic influence in modern European philosophy has been that of Spinoza (*q.v.*), which has steadily affected metaphysical thought, perhaps even more outside than within the professionally philosophical schools, from the time of Jacobi and Lessing down to the end of the 19th century. This is partly accounted for by the powerful attraction exercised by the naturalistic strain in Spinoza's doctrine on the devotees of physical science, partly by the tendency of many of the most prominent 19th cent. representatives of the Hegelian line of thought to interpret Hegel (*q.v.*) in a Spinozistic sense.

Whether the Spinozistic interpretation of Hegel is the true one might admit of question, and it has been rejected by such eminent Hegelian students as Hutchison Stirling and J. M. E. McTaggart, in the one case for a definitely theistic interpretation, in the other for a version which has more affinity with the monadism of Leibniz (*q.v.*) than with Spinoza's singularism. But in the main Hegel has become known, at least in the English-speaking world, through the work of philosophers with strong Spinozistic prepossessions, with the consequence that the influence of Hegelian ways of thinking has been definitely hostile to theism. Even among professedly Christian theologians allegiance to Hegel in philosophy has usually led to an extreme 'immanence' doctrine of God which at least compromised the theistic position.

More ephemeral has been the influence excited in the last half of the 19th cent. by the pessimistic atheism of Schopenhauer (*q.v.*), and in the last twenty or twenty-five years by the brilliant, if incoherent, anti-Christian polemics of Nietzsche (*q.v.*). Both the pessimism of Schopenhauer and the antitheism of Nietzsche are, however, too little reasoned and too obviously matters of personal temperament to be regarded as of permanent philosophical importance. The influence of Hegel, also, and still more that of Spinoza, would seem to be for the present a spent force. In the present state of philosophy the most formidable rival to theism as an explanation of the world appears to be the thoroughgoing rationalist pluralism of the 'new realism,' represented at its best by the writings of Bertrand Russell and G. E. Moore. Of this doctrine, as well as of the supposed objection to theism arising from the evolutionist's alleged vision of Nature as 'red in tooth and claw,' something is said below (§ 17).

3. Plato.—The importance of Plato as the creator of philosophical theology makes it necessary to begin any serious account of theism as a philosophical theory with a clear statement of the Platonic position, so far as that position was expressed by Plato in his writings. To call Plato the creator of philosophic theology does not, of course, mean that the belief in God is an invention of Plato. As has often been remarked, the general trend of the best Greek thought on the problems of human conduct and destiny—as represented, *e.g.*, by such poets as Aeschylus and Euripides—is in the direction of a vague monotheism. And it cannot be seriously doubted that an earnest practical faith in God was characteristic of Pythagoras and of Socrates. Even the most unreasonable scepticism about the historical good faith of Plato's accounts of his master cannot obscure the fact that Socrates gave up the whole of his mature life to the execution of a mission to which he believed himself to have been called by God and died as a martyr to his calling. But this, so far as we know, was a matter of personal religious conviction rather than of speculative theory. Even Plato himself does not attempt a formal philosophical statement and justification of the belief in God until we come to the *magnum opus* of his old age, the *Laws*. In his best known earlier writings—*e.g.*, the *Republic*—great stress is laid upon the importance for the formation of moral character of an ethically adequate conception of the divine nature. God must be thought of as perfectly good, and current religion must be purged of everything which suggests that there is anything unethical in His character or that His dealings with men have any other purpose than their true good. It is just because God is perfectly good that (*Republic*, *Theaetetus*) the end of life may be said to be to 'become like God.' God fashioned the world and made it the best possible world because it would be unworthy of His goodness to make it otherwise (*Timaeus*). True piety is to be a 'fellow-worker' with God (*Euthyphro*). We are God's sheep and He is our shepherd (*Politicus*). The souls of the righteous are in the hand of God, and when they depart from us it is to be with Him (*Phaedo*). But this is, of course, the language of religion, not of science, and we are made to understand the difference by the simple fact that nearly all that is said of God, outside the *Laws*, beyond the one emphatic statement about His perfect goodness, is conveyed in 'myths,' *i.e.* in imaginative stories, as to which we are cautioned that we cannot undertake to pronounce on their strict truth. Nor is any attempt made to *prove* either the existence or the perfect goodness of God. In particular the story of creation in the *Timaeus* is, as we are explicitly warned, not to be taken as scientific truth, but as a tale which is the most probable that can be told about matters which lie outside the region within which scientific knowledge is possible. If we did not possess the *Laws*, it would be legitimate, as in fact it is not, to doubt whether Plato did not agree with Kant that reasoned scientific knowledge of God is impossible, though on grounds which are not identical with Kant's. In the tenth book of the *Laws*, however,[1] we have a formal proof of God's existence, wholly devoid of any features of mythical colouring, which is expressly declared to be conclusive. The argument, the main principle of which had been already anticipated in the *Phaedrus*,[2] is as follows. The most universal characteristic of things is motion and change. Now, motions are of two kinds, (*a*) impressed, and (*b*) original or spontaneous. Or, to use Plato's own phraseology, there are motions which are able only to move something else (impressed or communicated movements), and there are motions which 'move themselves as well as other things.' And native or spontaneous movement is logically prior to impressed or communicated movement. We cannot

[1] 887 A–899 E. [2] *Phaedrus*, 245 C–E.

regard all movements as impressed or communicated without falling into an impossible logical *regressus in indefinitum*. Further, 'motion which moves itself' is precisely what we mean when we talk of ψυχή, 'soul.' 'Soul' is simply a shorter name for the κίνησις ἑαυτὴν κινεῖν δυναμένη. It is just when we see a thing manifestly capable of internally initiated movement or change that we feel bound to say that the thing in question is 'animated' or has a 'soul.' It follows, then, that souls and their various 'motions' (judgment, volition, hope, desire, and the like) are prior to bodies and their motions or changes. All bodily processes are derivative from and dependent on 'motions' of the soul, and it is just for this reason that Plato explicitly denies the doctrine, often imputed to him by the uncritical, that 'matter' can be the principle of evil. Further, good souls, in the degree of their goodness, are sources of orderly and beneficent motions; evil souls, of disorderly and evil motions. Now, the great recurrent motions which science discovers in the universe (the periodic motions of the heavenly bodies) are all regular and orderly and belong to the class of the 'good' motions. Hence they must be due to good souls. (It had been carefully laid down in an earlier passage that all apparent irregularities and anomalies in these motions are only apparent and disappear as our science becomes more adequate.) If, then, we define God as a perfectly good soul, we may say that, since the great motions of the universe are all perfectly orderly, they must be caused by God. God, however, cannot be the only soul, or 'movement that moves itself.' For, though the *magnalia naturae* exhibit perfect regularity, there are also irregular and destructive motions, such as those, *e.g.*, of disease or those due to a wicked will; and these are just as actual as facts as anything else. Thus the facts of the universe bear witness to the existence of souls which are not wholly good. There must be at least one 'bad' soul, which is not God, and there may, of course, be as many more as are required to account for the observed facts. The transcendence of God is thus safeguarded.

Plato's language about the 'bad' souls has been misunderstood both in ancient and in modern times. Plutarch[1] thought that he had discovered in Plato's words the doctrine of an ultimate dualism between a good and an evil world-soul. This view did not find favour with the Platonists of antiquity, but has been revived in modern times by Zeller, from the weight of whose name it has obtained a wholly undeserved consideration. Plato says nothing about an evil principle, in the *Laws* or anywhere else. What he does say[2] is merely that all motions cannot be due to a single soul; there must be at least two, the 'beneficent' and 'that which has power to effect the contrary results.' The whole context suggests that the bad souls of which he is thinking are chiefly those of passionate and ignorant men, which, of course, are numerous. It should further be noted that, in the passage of the *Laws* containing the theistic argument, Plato speaks throughout in the plural of 'gods,' giving the soul which moves the sun as an example of his meaning. This is, however, a mere consequence of the fact that the legislation of the *Laws* is designed for an ordinary Greek community. It is assumed that the State religion of the colony will recognize 'gods many,' and Plato's object is to substitute the heavenly bodies, or rather the souls which move them, as types of regularity and beneficence, for the morally frail and passionate anthropomorphic deities of actual Greek cults. Of Plato's personal conviction of the unity of God there can be no real doubt. The unity of God, 'the best soul,' follows in fact, as we may see from the *Timaeus*, from the unity of the universe. The universe is one and is a rational system; therefore it is the product of one intelligence.[3] That a Greek writing for Greeks should allow himself to speak of θεοί explains itself; what is really significant is that Plato speaks so frequently, and just when he wishes to be most impressive, of θεός.[4]

From the goodness of God, since God is a soul (ψυχή), it follows that everything in the world is governed by a wise and beneficent Providence, and that God's dealings with man are perfectly and inexorably just. Thus the tenth book of the *Laws* definitely creates 'natural theology' as a branch of philosophy for the first time and indicates once for all its main doctrines—the existence and goodness of God, the reality of God's providential government of the universe, the immortality of the soul, and the correspondence between man's destiny and his works. These doctrines together make up what was known as 'natural' or 'philosophical' theology, as distinct from both 'poetic' theology—the stories told of the gods by the poets—and 'civil' theology, which consists in knowledge of the cultus prescribed by the State.[1]

The question whether Plato's theology amounts to a complete theism is not without its difficulties. On the one hand, there is no doubt that, as Burnet has said,[2] Plato regarded his doctrine of God as the central thing in his whole system. It is precisely the activity of God, the perfectly good soul, that connects the world of 'becoming,' *i.e.* 'Nature,' the world of all that we call empirical existence, with the system of εἴδη. The reason why there is a world of 'things' at all is just that God, the perfectly good soul, exists and is eternally active. The perfectly good soul, of course, has a perfect knowledge of 'the Good,' and its activity consists in reproduction or 'imitation' of the Good. Thus all existents other than God owe the very fact of their existence to God, as they owe it also to Him that they are what they are. Still it does not appear that the Platonic God is *all* that later theists have meant by the Supreme. He is an existent, though a perfect one, and beyond all existents there is the system of 'form' or 'numbers.' This is the pattern (παράδειγμα) after which God makes heaven and earth and all that is in them, and is thus something metaphysically prior to God Himself. If we understand by theism the doctrine that God is the sole unconditioned source not only of existents but also of real possibilities, we shall have to say that it is only in Neo-Platonism that Greek philosophy succeeds in being fully theistic. A word or two may be said about the argument by which Plato establishes the existence of God. It contains in itself the germs of more than one of the 'proofs of the being of God' which have become traditional. Its presuppositions are two: (1) the universal validity of the principle of causality, and (2) the regularity of the cosmical motions—the 'reign of law' in the physical world. From the principle of causality, taken together with the assumption that there cannot be an infinite regress in the causal series, comes the conclusion that there must be an original cause (or causes) of all movements, which is 'self-moving'—*i.e.* a 'soul' or 'souls'—and from the regularity of the cosmic motions and the systematic interconnexion between them it follows that the ultimate 'mover' is the perfectly good soul. Thus Plato's reasoning combines in one argument the principle of the cosmological argument from the 'contingency of the world' to the existence of a First Cause and that of the argument from design, which is not degraded by Plato, as it has often been by modern apologists, into an argument from the alleged adaptation of the world to our individual convenience. As understood by Plato, the

[2] *Laws*, 896 E. [3] *Timaeus*, 30 D–31 B.
[4] In *Ep.* 13 he writes to Dionysius II. that he will distinguish letters of real importance from those which he is obliged to write as a matter of formal politeness by mentioning θεός and not θεοί in the opening sentences.

[1] The distinction in this form became fixed in consequence of the fact that it was adopted by the Roman encyclopaedist M. Terentius Varro and taken over from him by St. Augustine in the *de Civitate Dei*. The theology of the philosophers was called 'natural,' not, of course, with any thought of a contrast with 'revealed' truth, but because it was held to be scientific and true, unlike mythology, which the poets were believed to have invented, and the cultus of the State, which, as Hobbes puts it, 'is not philosophy but law.'
[2] *Greek Philosophy*, pt. i., *Thales to Plato*, London, 1914, p. 335.

argument from design is simply the argument from the intelligibility of the world of actual facts and events to intelligence in the cause which produces and sustains it.[1] Plato's argument is thus an *argumentum a posteriori*, in the correct scholastic, not in the inaccurate Kantian, sense of the phrase *a posteriori*; *i.e.*, it is an argument from the character of a known effect to the character of its cause. That there is a world of mutable things, and that, as scientific insight advances, the processes in this world of mutability are more and more found to exhibit conformity to intelligible laws, are assumed as empirically known truths, and without these empirical premisses the demonstration would not work. There is no hint in Plato of the line of thought which at a later date crystallized into the one genuinely *a priori* argument for the existence of God, the ontological proof, which, if valid, establishes its conclusion without any empirical premiss whatsoever.

4. Aristotle.—Aristotle's doctrine of God, though better known to the modern world than Plato's, is simply the Platonic doctrine rather more precisely expressed and shorn of its ethical and practical applications. With Aristotle, as with Plato, the doctrine of God is absolutely central, and the argument is once more based upon the assumption of the causal principle. Like Plato, Aristotle contends that communicated or impressed motion presupposes original or spontaneous motion, and like Plato he regards ψυχή as the one source of spontaneous movement. But here he is led to make a further refinement. The 'motions of the soul' arise from ὄρεξις, 'appetition,' and appetition is always appetition of something apprehended as good (ὀρεγόμεθα διότι δοκεῖ). This apprehension of an object as good is an exercise of νοῦς, an act of immediate intelligent apprehension. The apprehension is not itself a movement, though it gives rise to motions both of the soul and of the body. We must not then be content to trace back all motions to their origin in the 'movement which can move itself,' but behind even this we must look for an 'unmoved mover,' an unchanging initiator of all change. Otherwise we shall simply fall into an indefinite regress, and an indefinite regress in the order of efficient causes is unthinkable (the principle of the argument from the 'contingency of the world'). The unity of the supreme First Mover once more follows from the unity of the physical world. The whole physical world is a scene of 'becoming,' in which the potentialities latent in things are developed into actuality by the agency of efficient causes which are already themselves developed actualities. Behind every process of development lies the agency of such already developed actualities, and thus, just because there really is something and not nothing, there must be some actual agents which have never developed at all, but have been eternally and immutably active. From Aristotle's point of view, all processes of development depend upon the eternally regular and uninterrupted movements of the heavenly bodies. Hence there must be as many 'unmoved movers' as there are independent astronomical movements. Further, astronomical movements form a hierarchy. Each of the 50 odd concentric 'spheres' which Aristotle postulates to account for the apparent movements of the heavenly bodies has its own proper revolution and its own 'unmoved mover.' But there is one sphere which, without being enclosed by any other, encloses all the rest, and, according to the Aristotelian astronomy (which disagrees on this point wholly from Plato), communicates its movement to all the spheres it contains. This is the sphere of the fixed stars, which rotates uniformly on its axis in the period of 24 hours. The 'unmoved mover' of this sphere is consequently God. As that which He moves is one, and its movement is eternal, continuous, and regular, God is also one, eternal, immutable, the First Mover upon whom all motion in the universe depends.[1] So far Aristotle's doctrine is, in substance, that of Plato in the *Laws*, except that Aristotle has dogmatically committed himself to a particular astronomical theory, that of Eudoxus, which, for sound scientific reasons, did not commend itself to Plato. In his conception of the nature of the First Mover Aristotle departs more widely both from Plato and from true theism. God, as Aristotle describes Him, is not a ψυχή, but a νοῦς. And he infers from his doctrine that the First Mover must be unmoved the conclusion that the divine mind, unlike our minds, because it is unmoving, must eternally think one and the self-same object. Further, this object must be adequate to occupy the divine mind through eternity. It follows that the object of God's unbroken Sabbath of contemplation is God Himself. 'He thinks Himself and His thinking is a thinking of thinking (νόησις νοήσεως).'[2] In fact, though without the presence of God there could be no motion in the universe, God is supposed to be wholly unaware of the existence of the universe which He moves. He moves it by being an object of appetition to it, and thus it is aware of Him, but He is no more aware of it than the various objects of our human appetitions need be aware of us and our desire for them. The world's desire after God is precisely and exactly the 'desire of the moth for the star.' This conception, due apparently to Aristotle's own temperamental indifference to the practical life, of course strikes out of philosophical theology the doctrine of Providence and of the righteousness of God's dealings with man. In fact, since Aristotle held that 'goodness of character' is a different thing from 'goodness of intellect,' he is quite consistent when at the end of his *Ethics* he expressly denies that goodness of character or moral goodness is predicable of God.[3] God, in fact, becomes in Aristotle what Aristotle himself would have liked to be, if the conditions of human life would allow it—a mere 'magnified and non-natural' scientific thinker. In respect of this evacuation of all ethical content from the idea of God, Aristotle may fairly be said to be the founder of philosophical deism, as Plato was the founder of philosophical theism. It is clear that to Aristotle and his disciple Eudemus, who identifies the speculative life with the contemplation and worship of God,[4] the First Mover was an object of genuine worship and reverence, though the worship of such a being could have no real connexion with active good works; but a non-ethical deity, who knows nothing of humanity's needs and aspirations, can never become the centre of an enduring religion. Hence it is not surprising that, while Platonism continued throughout later antiquity to be the creed of educated religious men, Aristotelianism was reduced to simple naturalism within half a century of Aristotle's death by the third head of the school, Strato of Lampsacus.[5]

5. Epicureans.—The deism of the Epicureans is of no significance for natural theology. For all practical purposes the school were, what their opponents called them, pure atheists, since it was

[1] The notion of an unconscious intelligence or reason as the ground of things is excluded by Plato's doctrine that νοῦς can only exist in a ψυχή (*Sophistes*, 249 A, *Philebus*, 30 C, *Timaeus*, 30 B).

[1] See for all this in particular *Metaphysics*, 1072*a* 19–1073*b* 17, *Physics*, 258*b* 10 ff.

[2] *Metaphysics*, 1074*b* 33.

[3] *Ethica Nicomachea*, 1178*b* 7–23.

[4] τὸν θεὸν θεραπεύειν καὶ θεωρεῖν (*Ethica Eudemea*, 1249*b* 20).

one of their principal tenets that the gods not merely take no interest in the doings of men but play no part in cosmology; the world has been formed and continues to exist *opera sine divom*. The only use made by Epicurus of gods is a trivial one; their existence accounts for the phantasms of superhuman beings which are seen in dreams.

6. **Stoics.**—In Stoicism, on the other hand, natural theology of a kind plays a prominent part, though the original Stoic doctrine can hardly be called theistic. The theology of Zeno, Cleanthes, and Chrysippus is a materialistic doctrine of immanence. The substance of all that exists is a single body; in fact, the universe is a 'fire.' The cosmic fire is intelligent, and it is this fire that is God. This doctrine, borrowed by the founders of Stoicism from Heraclitus, but put forward with a conscious opposition, which Heraclitus would not have understood, to the immaterialism of Plato and Aristotle, is the nearest counterpart that ancient thought has to show to the Spinozist conception of the one substance with its plurality of disparate but 'parallel' attributes. But with the Stoics it is not, as with Spinoza, thought, but extension, that is the 'Aaron's rod that swallows all the rest' of the attributes.

As to the details of the doctrine. God and the world, though really one, are logically distinguished. At one time in the history of the universe the 'fire,' or God, exists alone in its purity and contains within itself all the *σπερματικοὶ λόγοι*, or constitutive ratios, of everything. There follows a process of evolution, identified by the Stoics with the 'downward path,' or *ὁδὸς κάτω*, of Heraclitus, in which the *σπερματικοὶ λόγοι* of all things are unfolded and a world of diversified existents produced. There is a second and antithetical process, regarded as identical with the Heraclitan *ὁδὸς ἄνω*, or 'upward path,' and ending in an *ἐκπύρωσις*, or general conflagration; the plurality of diverse existents is once more converted into the original fire, and God is left once more as the only existent. The whole double process of evolution followed by involution constitutes a 'great year,' and the life of the universe is made up of an endless succession of such 'great years,' each repeating the events of the preceding without variation (a fancy which we know from a fragment of Eudemus preserved by Simplicius in his commentary on the *Physics* of Aristotle[1] to go back to the early Pythagoreans, and which has been revived in our own time by Nietzsche as the doctrine of 'eternal recurrence'). The details of the process of evolution belong to the Stoic physics and do not concern us here. In accord with this doctrine, God is sometimes declared to be the same as the *κόσμος*, or universe, sometimes distinguished from it. 'They use the word *κόσμος* in three senses, to mean (1) God Himself . . . who is, of course, imperishable and unoriginate, the artificer of the world-order, who resumes into Himself and again begets out of Himself the whole of being in accord with certain cycles of time; (2) the world-order formed by the heavenly bodies, (3) the composite of these two.'[2] Hence the full definition of God was that God is *πῦρ τεχνικόν, ὁδῷ βαδίζον ἐπὶ γενέσιν κόσμου, ἐμπεριειληφὸς πάντας τοὺς σπερματικοὺς λόγους, καθ' οὓς ἕκαστα καθ' εἱμαρμένην γίνεται*, 'a fire of craft [or 'art'] proceeding in order to the generation of a world, containing in itself all the constitutive ratios in accord wherewith all things come to be in the order of destiny.'[3] Strictly speaking, this doctrine, which equates God with the *κόσμος*, is not theism at all, since it denies that there are any real existents other than God. But religiously the founders of Stoicism, as we see from the well-known *Hymn* of Cleanthes, were fervent worshippers of God. It was characteristic of the school from the first that they insisted strongly on the moral side of theism. Like the Platonists, they were vigorous asserters of Providence and used the doctrine to justify even such things as astrology, prophetic dreams, oracles, and divination. Providence was, however, regarded as identical with absolute predestination, and scientifically explained by the rigid mechanical concatenation of all events in a single causal system. Hence, as may be seen from the controversial essay of Plutarch on *The Contradictions in Stoicism* (*περὶ στωικῶν ἐναντιωμάτων*), the devices by which the Stoic philosophers tried to conciliate their optimistic belief in the providential order with their materialistic monism were often really fatal to the ascription of moral goodness to God.

In the writings of the Stoics of the Roman period, from whom the ideas of the school have become familiar to the modern world, the materialistic and fatalistic side of the doctrine is less prominent. They often seem to be teaching a simple spiritual theism. It must be remembered that all these writers are later than, and were greatly influenced by, Posidonius of Apamea (first half of 1st cent. B.C.), who gravely modified the original doctrine of Zeno and Chrysippus by contaminating it with Platonism, as his contemporary, Antiochus of Ascalon, tried unsuccessfully to introduce Stoicism into the Academy. It is precisely those among the later Stoics, such as Seneca, who can be shown to depend most completely on Posidonius in whom the monism and materialism of Stoicism is least apparent. To understand the real tendencies of the system, it is important to study it as it was before Posidonius had Platonized it. For this purpose the anti-Stoic essays of Plutarch and the account of Stoic doctrine given in the life of Zeno by Diogenes Laertius are particularly valuable. Indispensable for special students is H. von Arnim's collection of the complete fragments of the Stoics of the pre-Roman period, *Stoicorum Veterum Fragmenta*, 3 vols., Leipzig, 1904–05.

The one really original contribution made by Stoicism to natural theology is the appeal to 'innate ideas' and the *consensus gentium* as an argument for the existence of God. The doctrine of innate ideas (*κοιναὶ ἔννοιαι, notitiae communes*) is a consequence of the Aristotelian criticism of Plato. According to the theory of method expounded more specially in the *Phaedo* and the central books of the *Republic*, the work of science begins with the provisional assumption of a theory (*ὑπόθεσις*) to account for a group of observed facts. If the observed facts (*τὰ φαινόμενα*) agree with the results of deduction from the *ὑπόθεσις*, the 'appearances' are said to be 'saved' by the theory, and it is so far vindicated. It may still, however, be called in question, and in that case will have to be defended by being deduced from some more ultimate premisses which the impugner himself admits. It thus becomes a task for dialectic (or, as we should say, metaphysics), the highest science of all, to make a critical examination of the provisional assumptions (the unproved postulates) of all the other sciences and to discover the real unquestionable presuppositions of all knowledge. Aristotle insisted, as against this view, that the special postulates of each science must be self-evident when once they have been formulated. For the Stoics this doctrine, that every science depends upon self-evident universal premisses, created a difficulty, as in their theory of knowledge they were, unlike Aristotle, extreme sensationalists, regarding particular sense-perceptions as the foundation of all knowledge. They were accordingly obliged to provide some criticism or test by which those universal propositions which are valid generalizations from sensation may be discriminated from those which are not. An obvious test suggested itself. Generalizations which are made only by certain special groups of men or by particular individuals may fairly be supposed to be due to temperamental, educational, national, or racial bias; those which appear to be made without exception by all men, no matter how widely they differ in temperament, education, national traditions, social institutions, may be presumed to be formed spontaneously, and therefore naturally, *i.e.* as a consequence of the intrinsic character of mind. It is thus reasonable to regard these generalizations as true and thus to take the *consensus gentium* as the best guarantee for the truth of a belief. The Stoic *κοιναὶ ἔννοιαι*, 'common' notions, are thus innate in the very sense in which Descartes afterwards used the word. It is not meant that we come into the world with them already in our possession, but that the formation of them is due to the normal development of intelligence independently of any kind of bias. As the most obvious examples of such common notions the Stoics instanced the beliefs, which they held to be common to all mankind, 'that there are gods and that they care for us.'[1] All this passed, mainly through Cicero, into the natural theology of the 17th century. This explains why modern natural theologians have often been anxious to prove the universal diffusion

[2] Diogenes Laertius, vii. 70, 137.

[3] Aetius, *Placita*, i. 7, 33 (Diels, *Doxographi Graeci*, Berlin, 1879, p. 305). The same definition was given of *φύσις*, 'nature.' Cf. Cicero, *de Deor. Nat.* ii. 57: 'Zeno igitur ita naturam definit, ut eam dicat ignem esse artificiosum, ad gignendum progredientem via.'

[1] Diog. Laert. vii. 36, 52.

of the belief in God and why their critics have often laid great stress on travellers' reports which have been supposed to indicate the existence of 'atheistic' savages. The Stoics themselves, in appealing to universal agreement, did not, of course, mean to deny the sporadic appearance of individual atheists. This could be accounted for as the consequence of individual prejudices due to improper education and 'unnatural' institutions. What was supposed to be demonstrated was merely that belief in God and Providence is too widely diffused to be regarded as anything but a spontaneous and 'natural' conviction. The position taken up by some modern apologists who deny that there has ever been a single convinced and sincere atheist is an exaggeration of the Stoic doctrine.[1] It may be added that the degradation of the argument from design or 'intentional causality' into the crude form which it assumes in so much of our popular apologetics is mainly due to the extravagant exaltation of man by the Stoic philosophy. With Plato and Aristotle teleology means simply that the world of historical existents and processes is so ordered that it realizes an end which has absolute intrinsic worth.[2] It is to the Stoics that we owe the coarsening of the thought into the assertion that man and man's convenience and comfort are the intrinsic and absolute good which is the end realized by the cosmic processes. Thus they maintained that plants and animals exist only to furnish man with food and raiment convenient for him, or even with agreeable luxuries.

Porphyry[3] quotes from Chrysippus the statement that 'the gods made us for ourselves and one another, but animals for us, the horse to help us in war and the dog in hunting, leopards, bears, and lions, to practise ourselves in valour upon. The pig was made for nothing but to be sacrificed, and God mixed soul with its flesh like a seasoning to make it readily digestible for us. Shell fish of all kinds and birds he contrived that we might have no lack of soups and *entrées*.'[4] According to Plutarch,[5] Chrysippus carried things so far that he asserted in his work περὶ φύσεως that God made bugs to prevent us from sleeping too long and mice to teach us to take proper care of our cupboards.

7. Neo-Platonism.—In any account of the popular theism of antiquity prominence would have to be given to the utterances of the later Platonizing Roman Stoics, such as Seneca, and to the earnest defence of the ethical side of theism by writers like Plutarch and his contemporary Maximus of Tyre. Plutarch's philosophical essays which deal with the theistic problem are specially interesting, as his determination to treat Providence and the moral government of the world by God as serious matters leads him into sharp and acute criticism not only of the perfunctory deism of Epicurus but also of the Stoic pantheistic necessitarianism (especially in the essay περὶ στωικῶν ἐναντιωμάτων, which aims at showing that the materialism, pantheism, and determinism of Zeno and Chrysippus are inconsistent with their moral optimism and professed belief in an ethical Providence). Interesting, however, as this theological literature is to the historian of Platonism, it cannot be said to add anything of value to philosophical theism. The Neo-Platonist school, founded in Rome by Plotinus (*c.* A.D. 205–270), worked out for the first time a thoroughgoing metaphysical theism which provided the philosophical basis for the Christian theism of the whole Middle Ages. For the purposes of the present article it will be most convenient to reproduce the main features of this doctrine as it is presented by the great systematizer of the school, Proclus (A.D. 410–485), in his στοιχείωσις θεολογική, *Rudiments of Platonic Theology*.[1] In what follows nothing will be quoted from Proclus which does not form part of the teaching of the whole Neo-Platonic school from Plotinus onwards.

In Plato's own theology, or at least in the statement of it which he gives in his writings, as we have seen, God is not quite all that the Christian theist has usually meant by God. God is the supremely good 'soul' and the source, it appears, of all existents other than Himself. But we are not positively told what is the relation of God to the supreme principles of the Platonic system, the forms (εἴδη, ἰδέαι) or numbers, and in the mythical picture-language of the *Timaeus* these forms (or numbers) are certainly represented as superior to God; they are the pre-existing model or pattern which God contemplates in fashioning the world of finite existents, or, as Plato calls it, the world of 'becoming.' There is no warrant anywhere in Plato for the psychologizing interpretation, often put on his language since the time of Philo of Alexandria, which makes the forms into thoughts of the divine mind. This means in modern language that, though God is regarded as the source of actuality, He is not unambiguously held to be also the source of all real possibility. In Neo-Platonism the further step is taken. God is thought of as the absolute *prius* of everything, and the world of existents as dependent on Him not only for its actuality but also for all its possibilities. God is no longer regarded as a soul or even as a mind, but is simply identified at once with the Good which is described in *Republic*, bk. vi., as the source of 'being and knowledge,' though itself 'on the other side of' both being and knowledge, and with the One which, according to Aristotle, Plato regarded as the οὐσία, or formal element, in the forms themselves and as the same thing as the Good.[2] The One thus becomes in Neo-Platonism a transcendent God of whom nothing can in strictness be predicated. It must not even be said to be good, since it is identical with goodness, not a subject to which goodness can be ascribed as an attribute. Nor must it be said to be or exist; it is not a being or existent, but the transcendent source of all being, and is therefore regularly said to be ὑπερούσιον, 'super-essential,' or 'super-substantial.'[3] God, thus conceived as the transcendent and ineffable source both of actuality and of real possibility (of existences and of 'essences'), is connected with the actual world by the Neo-Platonic theory of causality. The theory is commonly known as that of 'emanation,' but the metaphor of emanation is with Plotinus and Proclus only a metaphor, and the

[1] For a classic statement of the general Stoic view of the place of God in the scheme of things see, besides the famous *Hymn* of Cleanthes preserved in Stobaeus, *Ecl.* i. 1, 12, p. 25, 3 (critical text in von Arnim, *Stoicorum Veterum Fragmenta*, i. 121 f., also J. Adam, *Texts to illustrate a Course of Elementary Lectures on Greek Philosophy after Aristotle*, London and New York, 1902, p. 54 f., and A. C. Pearson, *The Fragments of Zeno and Cleanthes*, Cambridge, 1891), the eloquent conclusion of [Aristotle] *de Mundo*, 397, b 9 ff. The latter gives the Posidonian version and betrays Academic influence by ending with a direct quotation from the 'admirable Plato' of *Laws*, 715 E–716 A. Cicero's expositions of Stoic theology, based mainly on Posidonius, are too well known to require special mention.

[2] It is significant, as Burnet has remarked, that the very word 'teleology,' as its form shows, is derived not directly from τέλος but from the adjective τέλειος, 'whole,' 'complete.'

[3] *De Abstinentia*, iii. 20.

[4] Cf. Cicero, *de Nat. Deor.* ii. 37: 'Scite enim Chrysippus, ut clypei causa involucrum, vaginam autem gladii, sic praeter mundum cetera omnia aliorum causa esse generata: ut eas fruges atque fructus quos terra gignit, animantium causa; animantes autem, hominum. . . . Ipse autem homo ortus est ad mundum contemplandum et imitandum.'

[5] *De Stoicorum repugnantiis*, 1044 C.

[1] There is no good critical edition of this important work. The least defective is that in F. Creuzer's *Initia philosophiae ac theologiae*, 3 vols., Frankfort, 1820–22.

[2] *Metaphys.* A 987*b* 20: ὡς μὲν οὖν ὕλην τὸ μέγα καὶ τὸ μικρὸν εἶναι ἀρχὰς, ὡς δ' οὐσίαν τὸ ἕν. A 988*a* 14: ἔτι δὲ τὴν τοῦ εὖ καὶ τοῦ κακῶς αἰτίαν, τοῖς στοιχείοις ἀπέδωκεν ἑκατέροις ἑκατέραν.

[3] Here we have the origin of the mystical 'negative way' in theology, and of the familiar scholastic doctrine that nothing whatever can be predicated univocally of God and of any creature, as well as of the proposition *Deus est suum esse*; *i.e.* in God the distinction between existence and *essentia*, valid for every other existent, ceases to have any meaning. It is from this last thought that the famous ontological argument for the being of God was destined to take its origin.

theory requires to be explained a little more fully, as it was not only influential throughout the Middle Ages but is tacitly presupposed in the famous attempt of Descartes to establish the existence of God in the *Third Meditation*. Causality, as understood by the Neo-Platonists, does not necessarily imply antecedence in time and is always a relation between substantival terms, not between events. The relation is dyadic and subsists between a producer (*τὸ παράγον*) and something which the activity of the producer calls into being (*τὸ παραγόμενον*). The cause of anything is the ground not merely of the existence of that thing but of its being what it is and having the character it has (the cause of its *essentia* as well as of its actuality). Causality is a relation of 'participation' (*μέθεξις*) or 'likeness'; *i.e.*, the effect (*τὸ παραγόμενον*), since it derives the fact that it is and its whole quality from its cause (*τὸ παράγον*), is like its cause, exhibits the same character but in a less perfect form.[1]

The Neo-Platonist theology is strictly creationist, not in the popular sense of regarding the world as having been made at a definite date in the past (all the Neo-Platonists held strongly that Plato, like Aristotle, meant to teach the 'eternity of the world'), but in the philosophical sense of maintaining the causal dependence of everything in the world upon God and upon God alone. What 'really is' and what 'becomes' form a hierarchy of manifestations of the excellences contained 'eminently' in the One, each member of the hierarchy, according as it is at a farther remove from God, exhibiting these excellences in a less perfect way. Proclus adds the further point that the causal activity of the higher principles extends farther down in the scale of being than that of those below them.[2] The One, or God, as we have seen, is 'above being' and is absolutely simple, not because it is void of character, but just because all perfections are completely and perfectly united and interpenetrant in it.[3] The reason why the One creates at all is that the One *is* goodness, and goodness is, of its very nature, active. It must 'overflow.'[4] That which is immediately produced by the 'overflowing' is *νοῦς*, 'intelligence' or 'understanding.' Or rather, since the fundamental inferiority of produced to producer shows itself at this stage in the form of a dualism, it is *νοῦς* together with the objects it contemplates, *τὰ νοητά*, the connected system of scientific concepts. The two are inseparable, for the *νοητά* 'have no subsistence outside the understanding'; they are not a realm of 'things-in-themselves,' for which Neo-Platonism has no room. As mind or understanding is an imperfect image or mirroring of the divine One, so soul is a further image or mirroring of mind. And mind and soul together make up for the Neo-Platonist the whole system of *ὄντα*, real things. Bodies, the natural world as disclosed through the senses, are images of soul and are properly not *ὄντα* but *γιγνόμενα*; they 'are' not, they 'become'—*i.e.*, they are 'appearances,' though we must remember that they really do appear and are the appearances or shows of souls, which are real *ὄντα*. Below these real shadows of real things, just as God was placed above the real things themselves, stands that 'shadow of a shade,' *πρώτη ὕλη*, bare 'stuff,' which neither is nor appears, and, as a mere potentiality of something better than itself, may properly be called *μὴ ὄν*.[5]

Besides being causally dependent on God, the series of *ὄντα* and *γιγνόμενα* is further connected with the One by *ἐπιστροφή*, 'inversion' or 'reflexion.' The effect not merely proceeds from its cause, but is inverted or reflected back into its cause. This is, in fact, a consequence of the identification of the First Cause with the universal Good. For the good of anything is that to union with which the thing in question aspires, and the universal Good is therefore, according to the old definition of Eudoxus, that *οὗ πάντα ἐφίεται*, 'that which all things go for.' As all things have their source in God, so all things find their end or completion in Him. In souls and minds this process of inversion takes place, as Proclus puts it, *γνωστικῶς*, as a *γνῶσις*, or knowing. It is in turning back on their source in contemplation that they come by self-knowledge, and are thus inverted into themselves as well as into it. The soul gets to know itself in learning to know *νοῦς*, and *νοῦς* learns its own true nature in contemplation of the One; in both cases self-knowledge is got by reaching out of one's self towards the higher.[1] Thus the transcendence of God, though it is so complete that we may not even predicate 'being' of Him, in no way interferes with the truth that the whole world 'lives and has its being' in God and has no origin or support but God.[2] The monotheism of this philosophy of religion is, of course, no more affected by the belief of the Neo-Platonists in an elaborate hierarchy of superhuman beings whom they call *θεοί* than the monotheism of Christians by the belief in the various orders of the angelic hierarchy, or that of Milton by his application of the appellation 'gods' to the fallen angels in *Paradise Lost*.

It should be particularly observed that the Neo-Platonic school, by definitely making the One its God and teaching that the One is 'beyond being,' is committed to theism as against pantheism. The world is in the One, but, precisely because the effect is only an imperfect mirroring of its cause, it would not be true to say in the same sense that the One is in the world. The relation between God and the world is that of one-sided dependence. God, or the One, produces *νοῦς*, *ψυχή*, and bodies; they do not produce the One. In fact, in the mythology elaborated by Proclus the *ἐγκόσμιοι θεοί* occupy the lowest rank among the orders of beings to whom he gives the name 'god,' thus corresponding to some of the middle ranks of the mediaeval hierarchy of angels.[3]

8. Anselm.—As is well known, when the Christian Church began to feel the need of a philosophical foundation for its theology, it sought that foundation primarily in Neo-Platonism. The Neo-Platonic influence was exerted in three main ways—through the Cappadocian Fathers, who, without incurring the condemnation which was passed on the speculations of Origen, incorporated much of Origen's Platonism in their system, through the prominent part played in the development of Christian theology by St. Augustine and Boethius, and through the authority enjoyed by the writings of the supposed Dionysius the Areopagite, a superficially Christianized version of the theological and angelological speculations of Proclus. The Neo-Platonic conception of God thus became part and parcel of orthodox Christian thought. It is this conception that St. Anselm assumes in his famous attempt to prove the existence of God by an argument which, in one form or another, has been a centre of philosophical controversy from the date of its first becoming generally known to our own day—the so-called 'ontological proof' of the existence of God. St. Anselm's own formulation of his argument will be found in chs. 2–3 of the little tract, written before he had been called from his monastery at Bec, to which he gave originally the name *Fides quaerens intellectum* and afterwards that of *Proslogion seu Alloquium de Dei existentia*. The object of the reasoning is to show that the existence of God is in fact an immediately evident truth. Uncertainty about God's existence is possible only so long as we are unaware of the true meaning of the word *Deus*. The argument, as given by Anselm, runs thus. By 'God' we

[1] The technical phrase of Proclus is that the characters which exist *καθ' ὕπαρξιν*—*i.e.* so as to be properly predicable of it—in the effect exist *κατ' αἰτίαν* in its cause. The scholastic way of putting the matter is to say that what exists *formaliter*—as constituting the *forma* or *essentia*—in the effect exists *eminenter* or *eminentiore modo*, 'in a more excellent manner,' in its cause. It is in virtue of this doctrine that the philosophical theology of Neo-Platonism and orthodox Christianity acquires a positive side. Though we may not predicate of God any 'perfection' (*i.e.* positive attribute) of a creature, yet, since all creatures are produced solely by God, we may say that their perfections are in God 'in a more excellent manner.' Hence, though we are forbidden to predicate anything univocally of God and a creature, we are permitted to reason *per analogiam* from beauty, wisdom, power, goodness in the creatures to the presence of superexcellent beauty, power, wisdom, goodness in the Creator.

[2] This is intended to justify in particular the view that 'bare matter,' though it cannot be regarded as produced by mind or soul, is still created by the One, and so to get rid of the dualism of God and matter.

[3] So the schoolmen maintain, on the same ground, that each attribute of God, power, wisdom, and the rest, *is* God.

[4] As the Christian mystics say, 'love *cannot* be idle.'

[5] The Neo-Platonist 'matter' is thus identical with that of Aristotle, but it is important that it is regarded as the remotest production of the One, not, as with Aristotle, as a principle independent of and coaeval with God.

[1] Bodies are incapable of 'inversion into self,' and they are not inverted into their immediate cause, soul, *γνωστικῶς*.

[2] When Kingsley in *Hypatia* makes his Neo-Platonic philosopher misquote St. Paul as saying that it is God who 'lives and has His being' in us, he is going wrong from mere ignorance of the doctrine he is criticizing.

[3] For the sources of the preceding paragraphs see Proclus, *Institutio theologica*, props. 1–6 (unity and plurality), 7–14 (causation, the good), 15–20 ('inversion'), 21, 23, 24, 31–47.

mean 'that than which nothing greater can be conceived.' It seems that a doubt may be felt about the existence of anything answering to this definition, since Scripture tells us that the fool has said in his heart (*i.e.* has thought) that there is no God. Anselm, in reply to such a 'fool,' argues as follows. Even the fool who doubts or denies the existence of 'that than which nothing greater can be thought' must understand what this phrase means before he can doubt or deny that there is such a thing.[1] Thus it is certain that God, as defined, is *in intellectu*—a phrase which means simply that the words 'that than which nothing greater can be thought' have a definite meaning. But, if God were only *in intellectu* (*i.e.*, if there were no object answering to the definition), we could think of something greater than God, for we could at least conceive that such a being was not merely thinkable but real.[2] Thus the argument is that, if 'that than which nothing greater can be conceived' exists only *in intellectu*, 'that than which nothing greater can be conceived' is not 'something than which nothing greater can be conceived,' and this is a formal contradiction *in terminis*. It follows therefore[3] that God cannot be conceived as non-existent and therefore that God cannot be conceived not to exist. How then can it be true that the fool 'has said in his heart' that God does not exist? Only in the sense that the fool attaches no sense or a mistaken sense to the word 'God.'[4] These few lines contain the whole of the famous 'proof'; the rest of the pamphlet is really taken up with the identification of 'that than which nothing greater can be conceived' with the universal Good.

Before going any farther, it may be well to make one or two reflexions on the general character of the argument as given by its originator. This is the more necessary as Anselm's reasoning is not quite identical with that of Descartes, who gives his own ontological proof in his *Fifth Meditation*, and it is principally from Kant's criticism of Descartes' argument that the ontological proof is known to modern students of philosophy. It will be noted that Anselm expressly presupposes the Neo-Platonic conception of God; it is the One of Plotinus and Proclus of which he undertakes to prove the reality. We should also observe that Anselm for the first time attempts a proof which is *a priori* in the proper sense of the phrase. The existence of the world is not one of the premisses of his reasoning, whereas with the Neo-Platonists the reality of the many is the starting-point of all argument. Again, it is no valid retort to Anselm to urge that his proof depends upon a definition and on nothing else, but nothing can be proved simply from a definition, since all definitions are merely conventions about the meaning of a sign. Anselm is not, of course, concerned to deny the truth of this account of definitions or to maintain that men are not free to attach any meaning they please to the sign *Deus*. The real question is whether among all our concepts there is just one, the concept of 'an x such that nothing greater than x can be conceived,' which implies *as part of its meaning* the actual existence of the corresponding object. It seems to the writer of this article that Anselm is at least right in maintaining that, if we can frame the concept 'thing than which no greater can be conceived,' we are bound to think of the object thus conceived as actual. To admit that what we are necessitated to think may be false is fatal to all philosophy and all science, and no exception can be taken to Anselm's argument on the ground that it excludes such an ultimate agnosticism. The really difficult question is rather whether there is any such concept as 'thing than which no greater can be conceived.'[5] The problem is not whether, granting that Anselm's definition of God has a meaning, the actual existence of God is included in that meaning, but whether the words given as the definition have a meaning at all or are not rather an 'unmeaning noise,' like the words, *e.g.*, 'line so crooked that none crookeder can be conceived' or 'rational fraction so small that none smaller can be conceived.' This is the difficulty which we shall find arising in connexion with every version of the ontological argument which has been given by metaphysicians. Whatever we may think on this point, it is plain that a proof of the Anselmian type is not what is ordinarily meant in logic by proof or demonstration. Its real object is not to deduce the existence of God from any more ultimate or certain premisses, but to find a definition of God such that, when the definition is substituted for the *definiendum*, the proposition 'There is one and only one God' is seen to be self-evident. The real function of the argument is, like that of an Aristotelian 'induction,' not to demonstrate something, but to 'point something out.'

Anselm's argument was at once subjected to severe criticism by his contemporary Gaunilo of Marmoutiers, in his 'Apology for the Fool' (*Liber pro Insipiente*), a tract which more than sustains comparison for real acumen with the better-known criticisms of the *Critique of Pure Reason*. Gaunilo remarks that it is one of the premisses of the Anselmian argument that *id quo nihil maius cogitari potest* exists at least in the *intellectus* even of the atheistic fool. It is assumed that God exists *in intellectu*, and the only point discussed is whether He exists also *in re*. But what is meant by this statement? It may mean only that the fool understands the meaning of the statement 'God exists.' But we understand the meaning of many propositions which we know to be false. Hence the existence of God is not proved by simply urging that we know what the theist means when he says that God exists. To make the argument valid, it ought to be shown that the fool cannot understand what the theist means without also seeing that his assertion is true, and Gaunilo denies that Anselm has established this point. Arguing, not as an empiricist, but from Neo-Platonic premisses common to himself with Anselm, he urges that in point of fact we have no positive adequate concept of God;[1] and it adds nothing to our information to be told that God is greater than all the things of which we have positive concepts.[2]

So far Gaunilo (who has been oddly mistaken by some modern critics for an empiricist) is simply playing off the negative or agnostic side of the theology common to himself with Anselm against the positive, and it is significant of his real purpose, which is that of a mystic rather than of an empiricist, that he quietly replaces Anselm's definition of God as 'that than which nothing greater can be conceived' by the very different phrase 'that which is greater than all which can be conceived.' He then continues as follows. Even if I admit, what is itself questionable, that I understand the meaning of the phrase 'something which is greater than all which can be conceived,' Anselm's argument cannot force me to admit that there really is such a thing. All that the argument proves is that it would be inconsistent to admit that there is such a thing and at the same time to deny its reality, since, if it is not real, it is not greater than things which are conceived and are real. But the 'fool' is not really convicted of this inconsistency, since all that he admits is, at the outside, that he understands the sense of the words 'something greater than all that can be conceived.' To make Anselm's argument cogent, some proof ought to be supplied that this something actually exists. If this proof is once forthcoming, Anselm's further demonstration that the something in question is all that God is

[1] 'Certe idem ipse insipiens, cum audit hoc ipsum quod dico . . . intelligit quod audit, et quod intelligit in intellectu ejus est, etiamsi non intelligat illud esse' (*Proslogion*, ch. 2).

[2] 'Convincitur ergo etiam insipiens esse vel in intellectu aliquid, quo nihil maius cogitari potest; quia hoc cum audit, intelligit; et quidquid intelligitur, in intellectu est. Et certe id, quo maius cogitari nequit, non potest esse in intellectu solo. Si enim vel in solo intellectu est, potest cogitari esse et in re: quod maius est' (*ib.* ch. 2).

[3] 'Sic ergo vere est aliquid quo maius cogitari non potest ut nec cogitari possit non esse: et hoc es tu, Domine Deus noster' (ch. 3).

[4] 'Nemo intelligens id quod Deus est, potest cogitare quia Deus non est; licet haec verba dicat in corde, aut sine ulla, aut cum aliqua extranea significatione' (ch. 4).

[5] Hobbes and others raised this question very pertinently when they replied to Descartes' argument from our possession of an 'idea of God' that we possess no 'idea' of God.

[1] 'Neque enim rem ipsam quae Deus est, novi' (*Pro Insipiente*, § 3).

[2] 'Nec prorsus aliter adhuc et in intellectu meo constat illud haberi, cum audio intelligoque dicentem esse aliquid maius omnibus quae valeant cogitari' (*ib.* § 4).

held to be will be valid. It is to illustrate this second point that Gaunilo introduces the reference to the famous lost island by which he is principally remembered. If this lost island were described to me as wealthier and better than any inhabited land, I should readily understand the meaning of the words, and the lost island would be 'in my understanding' in the same sense in which God may be said to be in the understanding of the fool. But it would be idle to say that the island must also really exist somewhere in the ocean because it would otherwise not be, as by definition it is, richer than all habitable lands. Finally he contends that it is not, as Anselm had assumed, a *proprium* of God that He can only be thought of as existing. It is true, no doubt, that we who know that God exists cannot think the proposition 'There is no God' true, but neither can we think any other proposition to be false which we know to be true; *e.g.*, I cannot think it true that I do not exist at this moment, because I know it to be true that I do exist. There may be a sense in which it is possible to think of my own non-existence, but, if there is, it is equally possible, in the same sense, to think of the non-existence of God, even though we know that God does exist.[1] This last point, of course, anticipates Hume's criticism that whatever we can think of as existing we can equally think of as not existing, and if sustained is fatal to every argument of the ontological type.

Anselm's reply to his critic is contained in the short *Liber Apologeticus contra Gaunilonem respondentem pro Insipiente*. He points out, naturally enough, that Gaunilo's substitution of the phrase 'that which is greater than everything which can be conceived' for 'that than which nothing greater can be conceived' alters the character of the argument, and that Gaunilo's reasoning about the lost island is not a real parallel to his own proof, which, as he insists, is applicable only in the case of the concept 'that than which nothing greater can be conceived.' What he does not prove, but merely asserts, is that this phrase really has a definite meaning and is not a nonsensical or insignificant sound. On this point he is content to say that even the 'fool' must conceive the meaning of the words before he can deny that they stand for a reality.

It is very difficult to follow Anselm here. If his reasoning is sound, it will prove not only the real existence of God but also the existence (in the logician's sense) of nothing, round squares, equilateral right-angled triangles, fabulous monsters, the greatest of all integers, since it is beyond a doubt that the propositions 'There is no such thing as a round square,' 'There are no fabulous monsters,' 'There is no integer which is the greatest of all integers,' etc., are true; and it may then be argued that, since they are true, round squares, etc., must exist in the *intellectus* of the person who asserts the propositions. What Anselm is assuming is, as he himself says, that a proposition cannot be understood unless its 'parts' are severally understood. From this he infers that, if 'there is no such thing as x' is a significant proposition, x must be a significant term. The assumption is plainly not justified, since my ground for asserting the proposition may be precisely that x has no intelligible meaning. The state of the case, then, seems to be that Anselm's argument certainly proves that, if 'that than which nothing greater can be conceived' (or 'that which cannot be conceived as not existing') exists *in intellectu*, it also exists *in re*. But the question whether it exists *in intellectu* remains undecided.

9. Thomas Aquinas.—The history of the subsequent fortunes of Anselm's theistic argument is a highly interesting one. In the 13th cent., the golden age of scholastic philosophy, it was widely known and discussed by all the leading thinkers. In the main the mediaeval philosophers seem to have been disposed to accept it until it was rejected as a sophism by St. Thomas, whose great authority has ever since discredited it. The principal 13th cent. texts relative to the subject have been edited with an acute commentary by the Benedictine Augustin Daniels.[1] It is a singular fact that, though all the teachers of the second half of the 13th cent. seem to have felt themselves obliged to make their attitude to Anselm's argument clear, no theologian of the 12th cent. appears to have taken any account of it. The most probable explanation of this silence seems to be that of Daniels, that the circulation of the *Proslogion* was slow and the work unknown to theologians in general until well on into the 13th century. It is certainly not true, as is sometimes said, that acceptance of the argument was confined to the Oxford Franciscans. Of the fifteen scholastics whose writings are examined by Daniels, three (one of whom is Albert the Great) express no opinion on the validity of the proof, ten (including Alexander of Hales, Bonaventura, and Scotus) accept it, only two (Richard of Middleton and St. Thomas) reject it. These facts seem of themselves to show that the discredit into which the ontological argument fell—it will be remembered that, when Descartes revived it in the 17th cent., critics were quick to remind him that he was laying himself open to at least the suspicion of heterodoxy—was due almost entirely to the general recognition of the weight of St. Thomas's criticisms. They are, in fact, so formidable that they still repay the closest attention and are, in the present writer's opinion, altogether on a much higher philosophical level than the better-known polemic of the *Critique of Pure Reason*. The general position of Thomas is precisely what we should expect from a philosopher whose thought has been moulded partly by Neo-Platonism and partly by Aristotelianism. He holds that the existence of God can be, and has been, sufficiently proved *a posteriori*, by reasoning from the works of God to their Author, and consequently he accepts as valid both the argument from the necessity of an unmoved First Mover (the Aristotelian argument) and the argument from design, in the wide sense of an argument from final or intentional causality (the Platonic argument from order and intelligibility in the world to an intelligent Creator). But he rejects altogether and on principle the attempt to demonstrate the existence of God *a priori* (from a mere consideration of the content of the concept of God).

The most important of the relevant passages in the works of Thomas are *Summa contra Gentiles*, i. 10, 11, and *Summa Theologica*, i. qu. ii. art. 1, both dealing formally with the question whether the proposition 'God exists' is self-evident. His own view on this question is that the proposition is self-evident if the *essentia* of God is once adequately known, but, since we in this life do not behold the *essentia* of God, His existence is not self-evident to our understanding. It is not immediately evident to us that there is anything 'than which a greater cannot be conceived,' or that 'God cannot be thought not to exist'; on this point St. Thomas is in complete agreement with Gaunilo. Anselm's argument, in fact, is a sophism arising from failure to distinguish between that which is *notum per se simpliciter* and that which is *quoad nos notum*, evident to us. 'For *simpliciter* it is self-evident that God exists, since what God is is his *esse*' ('cum hoc ipsum quod Deus est sit suum esse'; *i.e.*, God's *essentia* or 'what' and His existence are identical). 'But because we cannot conceive what God is, it remains unknown relatively to us.'[2] Anselm's reasoning is fallacious because (*a*) not all even of those who admit the existence of God are aware that God is 'that than which nothing greater can be conceived'; and (*b*), even if every one were aware of this, it would not follow that God exists otherwise than *in intellectu*; *i.e.*, all that would be proved is that we can think of such an object without absurdity. So Thomas asserts against Anselm that there is no logical absurdity in supposing the non-existence of God.[3] The same considerations are urged in much the same language in the article of the *Summa Theologica* already referred to. Thomas's own view is[4] that the existence of God can be demonstrated *a posteriori*, by reasoning

[1] 'Cogitare autem me non esse, quamdiu esse certissime scio, nescio utrum possim; sed si possum, cur non et quidquid aliud eadem certitudine scio? Si autem non possum, non erit jam istud proprium Deo' (*ib.* § 7).

[1] *Quellenbeitr. und Untersuch. zur Gesch. der Gottesbeweise im 13 Jahrh. mit bes. Berücks. des Arguments im Proslogion des heil. Anselm*, Münster, 1909.

[4] i. qu. ii. art. 2.

from effect to cause. He relies on five such *a posteriori* arguments,[1] which are (1) the argument from the fact of motion to the First Mover; (2) the parallel argument from causal agency to a First efficient Cause; (3) the argument from possibility and necessity, known more commonly as the argument from the contingency of the world;[2] (4) the argument from the scale of 'degrees of reality,' by which we infer from the existence of greater and lesser goods the existence of a perfect good which is the cause of all lesser degrees of goodness (in virtue of the specifically Neo-Platonic theory of causality already explained); (5) the argument *ex gubernatione rerum*, *i.e.* from final or intentional causality. (Even the processes of inanimate nature are ordered or adapted to the realization of an end or good; this adaptation presupposes an intelligent intention, and, since inanimate things have no intelligence of their own, a supermundane intelligence.) St. Thomas's arguments are thus all of one type. They are all appeals to the principle of causality taken in combination with the denial of the possibility of an infinite regress. Both the appeal to the principle of causality and the refusal to admit the infinite regress are direct inheritances from the Platonic-Aristotelian philosophy. The former is invalidated if the soundness of the Kantian criticism of speculative theology be admitted; the latter requires reconsideration in the light of what may be called the 'logical realism' of Bertrand Russell and the 'new' realists. Scotus, in the *Scriptum Oxoniense*,[3] restates the Anselmian argument with a modification which seems obviously meant to meet the fundamental point in Gaunilo's criticism and anticipates a line of thought afterwards developed by Leibniz. God is defined as 'quo cogitato sine contradictione maius cogitari non potest sine contradictione,' 'that which can be thought without a contradiction but than which nothing greater can be thought without a contradiction.' The important modification is the addition to the definition of the first *sine contradictione*. As Scotus says, 'in cuius cogitatione includitur contradictio illud dicitur non cogitabile.' It thus becomes a preliminary to the ontological proof to show that God can be 'thought without contradiction'; *i.e.*, that we really have a concept of God, or that the word 'God,' or the phrase employed as by definition equivalent to the word, is not an unmeaning noise. When this condition is fulfilled, Scotus holds, the Anselmian inference from the *esse in intellectu* of the *summum cogitabile sine contradictione* to its *esse in re* is valid.

10. **Descartes.**—Descartes' theism, like that of his mediaeval predecessors, is predominantly of the Neo-Platonic type, and is intimately connected with the assumption, which underlies the reasoning of the *Meditations*, that the principle of causality, in the very form which had been given to it by Proclus, is evident by the natural light of the understanding. The extent to which the thought of Descartes is in fundamentals Platonic is probably not adequately realized by most of his readers. Even the most original feature of his philosophy, the thoroughgoing reduction of natural science to mechanics, is really a reversion from mediaeval Aristotelianism to the standpoint of the early Academy, and the metaphysics of the *Meditations* is thoroughly Neo-Platonic. We quite misconceive Descartes' meaning if we regard the presence of God in his system as an excrescence due to the necessity of artificially bringing together again the artificially sundered worlds of body and mind. Even from the point of view of a merely mechanical interpretation of the world, Descartes is, of course, much more true to the analogies on which mechanical interpretations are founded in assuming the direction of the mechanism by God than those modern half-philosophers who attribute to the cosmic machine an inherent power of directing and repairing itself. He has not forgotten, as the modern materialist tends to do, that behind the most complicated and perfect machinery there is always intelligence which is not that of the machine to start it, to direct its workings, and to repair it. But, beyond this, Descartes has reasons for asserting the existence of God which are wholly independent of his reversion to the mathematical and mechanical standpoint in physics and would have been equally strong if he had adopted any other type of physical doctrine. The theism of Descartes is, in fact, dictated by two considerations—his unqualified acceptance of the principle of causality and his adherence to the conception of the 'Perfect Being' as the only adequate object of the understanding, and therefore the 'natural good' of rational beings (the 'ben dell' intelletto,' to use Dante's phrase). He is a theist, not because he holds the mechanical view of nature, but for the same more ultimate reason which leads him to hold that view, that he is, like the whole Platonic succession, a rationalist and consequently regards the knowledge of the 'Supreme Being' as the culmination of science.[1] The actual proofs of theism offered by Descartes are two. In the third *Meditation* we have the *a posteriori* proof in the special form of an argument from our possession of an idea of God to the existence of God as the cause of the idea. This is, of course, strictly on Neo-Platonic lines. In the fifth *Meditation* the *a posteriori* proof is confirmed by an *a priori* proof which turns out to be, in principle, a restatement of the Anselmian argument with a modification which is by no means an obvious improvement.

The well-known argument of the third *Meditation* runs thus. I have an 'idea' of the 'Perfect' or 'Infinite' Being. My possession of this idea, like any other fact, demands a causal explanation. The explanation cannot be that I am myself the Perfect and Infinite Being and that the idea is derived from my immediate awareness of myself, because I am aware of myself as, in many ways, defective and limited. It is not derived from acquaintance with other persons or things, which are all no less limited and finite than myself; and it has not been obtained by an imaginative combination of the various perfections I have observed separately in different finite things, for internal simplicity is itself one of the perfections which I think of as constituting the 'Infinite Being.' Nor again is 'infinite' a merely negative expression. (If it were, it might, of course, be objected that, when I say 'infinite,' there is no definite concept corresponding to the word.) For in the order of logic the infinite is prior to the finite. If I had not already an intelligible concept of infinity, I could not even be aware of my own finiteness. There is thus only one possible cause of my possession of the idea of the Infinite Being. It must be the effect of a really existing Infinite Being, who possesses *eminenter* or *formaliter* all the perfection which my idea of the Infinite Being contains objectively, *i.e.* by way of representation. God therefore exists, and my idea of God may be said to be the mark which the Creator has stamped on His creature. It may be added that, to argue the point even more generally, I who have this idea could not exist if the object of the idea did not also exist. For, since time is no more than a sequence of moments, each independent of all the rest, conservation, continuance in existence, is logically equivalent to fresh creation at every moment, and it is certain that I have no power to create myself. (This is proved by urging that it is easier to bestow new excellences on what already exists than to create. If then I cannot bestow infinite wisdom or power on myself, as I know I cannot, *a fortiori* I am not my own creator.) If it is urged that my parents are my creators, and their parents in turn their creators, we fall into the infinite regress. Thus the mere fact of the existence of any finite thing is proof of the existence of the Infinite Being; *i.e.*, if anything whose existence requires an external cause exists (and the Cartesian *cogito* assures me of the existence of at least one such thing), there exists also a Supreme Being whose existence requires no external cause (another form of the argument called by St. Thomas the argument from possibility and necessity).

The argument from my possession of an idea of God is Descartes' own substantial contribution to the philosophy of theism. It must be carefully distinguished from the old Stoic appeal to the *consensus gentium*. Descartes' critics were not really hitting a blot in his reasoning when they said that savages and atheists do not possess this idea. Against such objections Descartes' own explanation, that he only meant that, given the knowledge of myself from which he starts, reflective analysis is sufficient to lead to the concept of an Infinite Being, is a sufficient rejoinder. He seems to be equally right in his contention that the concept of an Infinitely Perfect Being is logically implied in my recognition of my own finitude, just as T. H. Green maintains that the recognition of a morally 'better' implies the conception of a 'best.' The real point of weakness in the argument, so far as the present writer can see, lies elsewhere. Descartes is clearly right in maintaining that the concept of a Being who combines all perfections or excellences in the absolute internal simplicity of his own nature is not formed by a process of synthesis; it is clearly obtained by

[1] 1. qu. ii. art. 3.

[2] The argument is that whatever is merely possible or contingent exists at some times but not at others. Hence, if all things are merely possible or contingent, there must have been a time when nothing existed at all. But (in virtue of the principle of causality), if there had ever been a moment when there was nothing at all, nothing could ever have come to be. Hence the fact that there is something now proves that there must be 'something in things' which is *necessary*, *i.e.* incapable of not existing. And the argument from the impossibility of an indefinite regress is then invoked to show that there must be *one* ultimate necessary being.

[3] See the relevant passages in Daniels, pp. 105–107.

[1] Perfecta scientia,' as St. Hilary puts it, 'Deum scire.'

the process of 'passing to the limit,' of which mathematical reasoning furnishes so many examples. But we are not really authorized to infer from our ability to conceive the limit of a series or of a sum of terms that a given series has a limit or a given sum a limiting value. Whether a series or a sum has a limiting value or not has to be discovered by examination in each special case; it is notorious that mathematicians down to a very recent date have been repeatedly led into fallacies by the assumption that limits exist where, in point of fact, they do not. Thus, when we have conceded to Descartes that there is an idea of the Infinitely Perfect Being and that this idea is presupposed in our own judgment that we and other things are finite, it does not follow of itself that the series of existents, arranged in ascending order of perfection (assuming such an arrangement to be possible), must have an actual upper limit. This is the very point which ought to be proved, and has not been proved. Descartes himself was presumably led to ignore the difficulty by the laxness with which he employs the word idea to cover alike memory-images, concepts, and judgments. When once he has allowed himself to call a judgment an idea, it is easy for him to think that he has bridged over the chasm between the concept of God and the judgment that God exists. The whole argument, it will be observed, is based on the combination of the Neo-Platonic doctrine of causality with the doctrine of representative perception. According to the latter doctrine, the direct and immediate object of apprehension, both in sense-perception and in thought, is never an extra-mental reality, but always itself mental or 'in the mind.' When this theory is combined with the view that everything that becomes has a cause and that all causality is imperfect mirroring, we get at once the proposition of Descartes that the cause of any idea must contain eminently or formally at least as much perfection as the idea contains objectively. 'Eminently' here answers to the *κατ' αἰτίαν* of Proclus, 'formally' to his *καθ' ὑπαρξιν*, 'objectively' to his *κατὰ μέθεξιν*.

The *a priori* or ontological argument of the fifth *Meditation* runs as follows. By 'God' I mean a being who has all perfections. But existence is a perfection. Therefore the being who has all perfections has existence; *i.e.* God exists. Or, in other words, just as I see when I analyse the idea of a [rectilinear] triangle that it includes the property of having the sum of the internal angles equal to π, so, when I analyse the idea of God, I find that it includes existence. God therefore exists and exists necessarily. (Thus Descartes seems to assume that there is just one existential proposition, and only one which is, in Kant's sense of the term, analytical, viz. the proposition 'God exists.') The objection that St. Thomas (now the recognized chief authority in all questions of theology) had rejected the Anselmian argument leads Descartes, in his *Reply* to the *First Objections*, to insist vehemently that his own proof is not that of Anselm, but differs on a vital point. The force of his own reasoning depends entirely on the fact that existence is already contained in the concept of God. Anselm[1] had said nothing about this, and that was why St. Thomas was reasonably dissatisfied with his argument; *i.e.*, the all-important point is that, according to Descartes, the proposition 'God exists' is analytic; Anselm had left it an open question whether it might not be synthetic. Historically this modification of the ontological proof is important, since Kant (who appears not to have known the writings of St. Anselm) makes it the main object of his attack on the proof to show that the proposition 'God exists' is synthetic. It is precisely because the proposition is synthetic, though the conditions which make the affirmation of an *a priori* synthetic proposition legitimate are, in this case, not fulfilled, that we can, according to Kant, have no speculative certainty of the existence of God. If Descartes should be right in regarding 'God exists' as an analytic proposition, Kant's antitheological polemic would become a mere *ignoratio elenchi*.

The further peculiarity of the Cartesian argument on which Kant fastens, that it improperly treats existence as a predicate or attribute, is not really of much importance. Whether all propositions can without violence to their meaning be represented as asserting (or denying) a predicate of a subject is an important question for formal logic, but seems to have no relevance to theology. If there is no predicate in the proposition 'God exists,' it must be held, on the same ground, that there is no predicate in such a proposition as 'Joseph dreams' or 'Esau hunts' or 'The rich man died.' *Per contra*, if dreaming, hunting, and dying are predicates in these propositions (as Kant, who professed to regard logic as a science created perfect by Aristotle, ought to hold, and presumably did hold), existence is a predicate in every proposition of the form '*x* exists.' The only question it is relevant to raise about the Cartesian argument is the question whether in the special case of the *ens summe perfectum* existence (whether existence be regarded as a predicate or not) can be asserted to be part of the meaning of a concept.

Whether there is really so much difference as Descartes maintains between his own argument and Anselm's may be doubted. Certainly the definition from which Anselm starts (God is *id quo maius cogitari non potest*) does not specify existence as part of the meaning of the concept. But, since Anselm tries to show that admission of the definition is logically tantamount to admitting that 'God cannot be thought not to be,' the difference between him and Descartes seems to be that Anselm tries to prove the point which Descartes is content to assume without more ado. It is hard to believe, as Descartes does, that St. Thomas, who denied that God is *notum per se quoad nos*, and gave a very sensible reason for his denial, would have regarded the Cartesian version of the proof as anything more than a glaring *petitio principii*.

11. Spinoza.—With Spinoza's attempt to give a pantheistic turn to the Neo-Platonic and Cartesian lines of thought it is not necessary to concern ourselves further than to remark that the whole of the First Part of the *Ethics* is logically no better than one long *petitio*. The first, third, and sixth of the definitions already contain the two assumptions, that God = *substantia* = *causa sui* and that *causa sui* (which is defined as 'that whereof the nature cannot be conceived but as existing') exists. Where the whole doctrine has thus been taken for granted by arbitrary definition, it is really superfluous to add anything in the way of 'proof,' even if the 'proofs' themselves were more free than they are from formal logical fallacy. What Spinoza wholly evades considering is the question, which is really fundamental, whether the definition of *causa sui* is more than a 'meaningless noise.'

One particularly glaring example of Spinoza's singular carelessness about his initial definitions may be noted. He has taken from Neo-Platonism the first and most fundamental notion of his system, that of *causa sui* (*τὸ αὐθυπόστατον* of Proclus). Now, by calling a thing *αὐθυπόστατον*, the Neo-Platonists meant exactly what they said, that it 'causes' or 'produces' itself (*προάγει ἑαυτό*). Hence they confined the name *αὐθυπόστατα* to minds and souls and expressly maintained that the One, or God, having no cause, being unproduced, is not *αὐθυπόστατον*;[1] *i.e.*, they understood *causa sui* in a positive sense. Theologians had done the same thing; as Arnauld said in his comments on Descartes' *Meditations*,[2] no theologian would admit that God is *a se positive tanquam a causa*, but at most that God may be said to be *a se* in a purely negative sense—*i.e.*, in the sense that He is not an effect of anything else. Spinozism succeeds in appearing to satisfy our demand for an object of religious adoration only by a constant equivocation. It defines *causa sui* (=*τὸ αὐθυπόστατον*) in the positive Neo-Platonic sense as *id cuius essentia involvit existentiam* (*τὸ τοῦ εἶναι ἑαυτῷ παρακτικόν*) and then asserts of it all that Neo-Platonism had asserted of the uncaused One. To put the point rather differently, it defines God as 'that whereof the *essentia* implies existence' and transfers to God, so defined, what theologians have asserted of a God in whom the distinction between *existentia* and *essentia* is unmeaning. Spinoza commits the paralogism in set terms in the first sentence of the *Ethics*: [1] Per causam sui intelligo id cuius essentia *involvit* existentiam, sive id cuius natura non potest concipi nisi existens.'

12. Locke.—Locke's proof of theism,[3] which he regards as having an evidence 'equal to mathematical certainty,' though in some ways perfunctory, is in its general character of the Neo-Platonic type. He does not refer to the *a priori* or ontological argument, and refuses to pronounce any opinion on Descartes' own special argument from our possession of an idea of God except to remark that 'It is an ill way of establishing this truth and silencing atheists to lay the whole stress of so important a point as this upon that sole foundation.' (As the context shows, Locke thinks that it would be a true and relevant criticism of Descartes to say that some men have no idea, and others false ideas, of God.) It is not quite clear whether Locke regards the certainty of theism as equal to the certainty with which we know actually perceived facts or the fact of our own existence. He says that we have more certainty of it 'than of anything our senses have not immediately discovered to us,' and again that 'we more certainly know that there is a God, than that there is anything else without us.' This certainty looks as if Locke held (as Descartes did not) that the existence of God is less certain than our own, and

[1] The name of Anselm occurs neither in the *Objections* nor in Descartes' *Reply*. Apparently both he and his critic knew the Anselmian argument only at second hand, through Thomas. Descartes' point, to be strictly accurate, is that his own argument turns wholly on the contention that concepts in general contain only the 'possible existence' of a corresponding object, but the concept of God 'contains the necessary existence' of God.

[1] Proclus, *Instit. theol.*, prop. 40: *ἀνάγκη ἄρα τὸ αὐθυπόστατον εἶναι μετὰ τὸ πρῶτον.*

[2] *Objectiones Quartae*, § 'de Deo.'

[3] *Essay*, bk. iv. ch. 10, 'Of our Knowledge of the Existence of a God.'

possibly less certain than that of the objects of actual and present sense-perception. But it is also possible that he only means that our certainty in the last two cases is immediate, but in the first depends on an ability, not found in all men, to follow the steps of a deduction. He may not intend to suggest that, to the man who can perform the deduction, its conclusion is inferior in certainty to any immediate cognition, 'intuitive' or 'sensitive.'

Locke's own proof is the usual *a posteriori* one based on the principle of causality and the empirical proposition (guaranteed by the *cogito*) that something (viz. myself) exists. It is also assumed, as usual, that a cause must contain more reality or perfection than any of its effects, as the Neo-Platonists had taught. The argument then becomes this: I exist; therefore I must have a cause; this cause cannot be 'bare nothing'; therefore it is a positive something. Since 'bare nothing' cannot be the cause of anything, therefore the cause of my own existence and that of all other existents must be eternal. (The impossibility of the endless regress and the 'contingency of the world' are not mentioned, but are of course tacitly presupposed.) An effect must derive all its properties from its cause. Therefore the 'eternal cause' must be the most powerful of things. (It is assumed that the cause has not only as much 'reality' as the effects, but more, and further that there can be only one 'eternal cause' — a point which Locke is hardly entitled by his own metaphysics to assume.) There is intelligence in myself, the effect, and therefore there is intelligence (of a higher degree) in the cause. The 'eternal cause' is thus 'most knowing' as well as 'most powerful.' From this Locke thinks it follows that this cause is what we mean by God; whether we use the name or not is a mere matter of vocabulary. 'There is an eternal, most powerful, and most knowing Being; which whether any one will please to call God, it matters not.' The rest of the chapter is given to an argument in proof of the immateriality of the eternal cause. The goodness of this cause Locke presumably held, as any Platonist might, to be inseparable from its wisdom. He does not seem to reflect that he has given no reason for supposing either the power or the intelligence of the 'eternal cause' to be perfect. His argument is thus only the familiar one from causality very badly stated and with most of its real premisses left unexpressed.

13. Leibniz.—Leibniz's treatment of the subject is far more adequate. In his system, at least as represented in his best known works, the proposition 'God exists' holds a unique position. It is a 'truth of fact,' and therefore, like all 'truths of fact,' synthetic. But it is the only truth of fact which is capable of demonstration. In general, only 'truths of reason,' analytic propositions, admit of formal demonstration, because the demonstration of a proposition is nothing but its analysis into simpler propositions which are seen on inspection to be identities. This is why the 'principle of contradiction' (A is not non-A) is regarded by Leibniz as the supreme principle of all truths of reason. Truths of fact (which all assert actual existence) do not fall under the principle of contradiction, but under that of sufficient reason, and thus, with the one exception of the proposition that God exists, they are not analysable into identities and cannot be formally demonstrated. The anomalous character of the proposition 'God exists' vanishes, however, when we discover from the papers published by Couturat[1] that Leibniz's real view was that all truths are analytic, the only difference between 'truths of reason' and 'truths of fact' being that the former can be resolved into identities by a finite number of steps of analysis, the latter require (like the extraction of the square root of an integer which is not a perfect square) an infinite number of intermediate steps.[2] It follows that God, being omniscient, knows all truths of fact *a priori* (*i.e.* sees them to be identities), just as Leibniz says more than once that God sees 'from eternity' in the 'notion' of Peter that Peter will repent of his denial, and in the 'notion' of Judas that Judas will die impenitent, and that the distinction between the necessary truths of reason and the contingent truths of fact means nothing to him. *Quoad nos* truths of fact are, in general, contingent merely because we cannot perform an infinite analysis. The peculiarity of the one truth of fact which is necessary *quoad nos*, 'God exists,' is merely that this proposition does not require for its proof *a priori* an infinite series of resolutions. In being capable of resolution into identities by a finite number of steps it resembles the truths of reason.

Consequently Leibniz is bound to hold that the Anselmian argument *a priori* from the meaning of the concept of God to the real existence of God is in principle valid. Since he also held that all propositions without exception are predicative, he naturally adopts the form of the argument used by Descartes, viz. that the predicate of the proposition 'God exists' is already implicitly contained in the subject. Descartes' proof is valid, but incomplete. To make it complete it is only necessary to show that the concept of God is a genuine concept, *i.e.* that it contains no contradiction, *i.e.* does not attempt to unite incompatible constituents.[1] Leibniz thinks that this can be shown by the consideration that the 'most perfect' or 'most real' being means the being of whom no simple positive predicate can be denied. (Any being of whom a positive simple predicate could be denied would be without the excellence or perfection for which that predicate stands.) Now, all complex predicates can be resolved into simple ones, and Leibniz holds that all *positive* simple predicates are compossible in a single subject just because they are all positive. If any two predicates are incompossible, one of them must deny what the other affirms. But no simple predicate denies anything. Consequently all simple predicates can 'inhere' in a single subject. This proves that 'the most real' being is possible. And Descartes has proved in the fifth *Meditation* that, 'if the most real being is possible, it is also actual.' Hence the 'ontological' proof, when completed by the preliminary proof that the most real being is possible, is a valid demonstration.[2] There is an obvious weakness in the argument. Leibniz assumes that, if we have one proposition, 'A is B,' where B is a 'simple' predicate, and a second, 'A is C,' and the two are incompatible, the proposition 'A is C' must be capable of resolution into simpler propositions, of which one is 'A is not B.' It ought to follow that, since the propositions 'A is red' and 'A is green' are incompatible, if 'red' is a simple quality, 'green' is a complex. But, in point of fact, green is as much a simple positive 'perfection' as red. This seems sufficient reason for regarding Leibniz's proof that the *ens realissimum* is possible as a failure. A more promising line of thought is suggested by the short memoir of 1701, *De la Demonstration Cartésienne de l'existence de Dieu du R. P. Lami*, where Leibniz is content to argue that the *ens a se* must exist because, if there were no *ens a se*, there would be no real possibilities—a position since made familiar by Lotze's adoption of it. It is worth noting that in the chapter of the *Nouveaux Essais* where Leibniz is commenting on the corresponding chapter of Locke's *Essay* he feels himself, as standing outside the Roman Church, free to say expressly that St. Thomas was wrong in rejecting Anselm's proof and to commend Descartes for rehabilitating it.

Leibniz naturally agrees with Locke that there are several ways of proving the existence of God and that none of the proofs should be neglected. He himself expressly recognizes three proofs besides the ontological.[3] These are (*a*) the cosmological argument from the actual existence of the world to the existence of God as its cause (the standing Platonic-Aristotelian proof); (*b*) the argument from 'eternal truths'—truths which involve no reference to time or particular temporal existents in time, and would still be true if the world of temporal existents had never existed—to the 'eternal' intellect of God as their source; (*c*) the argument from 'pre-established harmony. This is a special version of the teleological argument from the order and purpose revealed in the world to an ordering and designing intellect as its source. Any remarks which the present writer desires to make upon these *a posteriori* theistic arguments will more naturally find their place in a later paragraph. But it should be mentioned that the use of the argument from design introduces a curious contradiction into Leibniz's peculiar metaphysic. From his view that all propositions are predications and that all true propositions can be analysed into identities it follows at once that, as he constantly asserts, every real existent (every monad) is the ground of all its attributes. Since existence itself, on this view, is a predicate or attribute, the world of existing monads ought to be its own ground, and there should be no need of any external cause to account for the order found in it. Accordingly we find

[1] *Opuscules et fragments inédits de Leibniz*, Paris, 1903, p. 518 ff.

[2] *Ib.* p. 518: 'Semper igitur praedicatum seu consequens inest subiecto seu antecedenti et in hoc ipso consistit natura veritatis in universum'; p. 519: the law of sufficient reason itself is a consequence of this, for 'alioqui veritas daretur, quae non posset probari a priori, seu quae non resolveretur in identicas, quod est contra naturam veritatis quae (semper) vel expresse vel implicite identica est'; p. 376: 'omnes propositiones existentiales sunt verae quidem, sed non necessariae, nam non possunt demonstrari nisi infinitis adhibitis.'

[1] Cf. what has been said above about the attitude of Scotus, by whom Leibniz may very possibly have been influenced.

[2] *Nouveaux Essais*, iv. 10, § 7: *Meditationes de Cognitione, Veritate et Ideis.*

[3] See the discussion of them in B. Russell, *A Critical Exposition of the Philosophy of Leibniz*, ch. ix.

Leibniz himself at times explaining why the actual world, rather than any other equally possible world, exists, by ascribing to the various possible worlds an 'appetence of existence' (*existuritio*) proportionate to their degree of internal harmony, and saying that the most orderly of them is actual just because its *existuritio* is a maximum,[1] but elsewhere, especially in more popular writings, treating existence as something which is conferred on the most orderly and harmonious of the possible worlds by God in virtue of His 'choice of the best.' Unless one is prepared, as the present writer after long study is not, to accuse Leibniz of insincerity, it seems impossible not to recognize here a fundamental inconsistency between his personal religious convictions and the logical requirements of his metaphysical system. If all true propositions are identities, philosophy must be atheistic.[2]

14. Hume.—The most important philosophical treatment of the theistic problem between Leibniz and Kant is unmistakably that of Hume in his *Dialogues concerning Natural Religion* (written apparently before 1751, though not published until 1779, three years after the author's death). In judging this work it must be borne in mind that it makes no pretence to expound the theology of the author. It is strictly what it purports to be, a conversation between a supporter of philosophic 'natural theology,' Cleanthes, a violent fideist, Demea, intended as a representative of orthodoxy, and a sceptic, Philo. The responsibility for the positions maintained by the three speakers rests entirely with themselves. Hume abstains from indicating his own sympathies except in the final sentence, where he suggests that the 'opinions' (he is careful not to say 'the arguments') of the 'natural theologian' Cleanthes probably come nearer to the truth than those of Philo, and those of Philo than those of Demea.[3] Hume's real position in natural theology, as in philosophy in general, seems to have been that of a consistent Academic. Genuine scepticism is a rare thing and liable to be misunderstood. So Hume's general philosophy has commonly been mistaken, as by T. H. Green, Huxley, and others, for a shallow sensationalistic phenomenalism. In reality he is neither a sensationalist nor a phenomenalist. He holds that there are insuperable difficulties in the Cartesian rationalism, and that, on the other hand, sensationalism leads to the conclusion that science is an impossibility. Being unable to accept either Cartesianism or sensationalism, and knowing of no third choice in philosophy, he adopts the sceptical attitude of *ἐποχή*, 'suspense of judgment.' There can be no question of seriously regarding principles presupposed in all science as false; at the same time Hume confesses himself unable to justify these principles. His real attitude towards theism seems to have been the same. It is probably true, and, as the letter to Elliot shows, Hume is very unwilling to believe that his leaning towards it rests on nothing more solid than emotional bias, but the alleged proofs of theism are open to criticisms which Hume does not know how to refute, and there are 'appearances' which it is hard to reconcile with the theistic 'hypothesis.' We have not, as it is to be wished we had, convincing proof of its truth, though Hume lets us see that personally he inclines to accept it. His attitude is neither that of a zealous 'infidel' nor that of a 'phenomenalist' and anti-theist. Neither the Hume of contemporary High Churchmen like Johnson and Wesley nor the Hume of Huxley's biography is the Hume of historical fact.[1]

In form the *Dialogues*, like some of Plato's greatest works, are reported conversation. An unnamed narrator informs his friend Hermippus of the discussions between Cleanthes, Philo, and Demea. The narrator, it should be observed, is a theist.

'What truth so obvious, so certain, as the *BEING* of a God? . . . What truth so important as this, which is the ground of all our hopes, the surest foundation of morality, the firmest support of society, and the only principle which ought never to be a moment absent from our thoughts and meditations? But in treating of this obvious and important truth; what obscure questions occur, concerning the *NATURE* of that divine being; his attributes, his decrees, his plan of providence?'

There is no sign of irony in this utterance, and its seriousness is all the more probable that Hume proceeds to dwell on the intellectual difference between the characters of the dialogue, assigning an 'accurate philosophical turn' to Cleanthes the theist, 'careless scepticism' to Philo, and 'rigid inflexible orthodoxy' to Demea.[2] His obvious intention is to predispose the reader to find in Cleanthes the hero of the work. It is with the same object that, until the discussion is near its end, Demea, the zealot for unreasoning faith, is made to regard Philo as an ally against Cleanthes.[3] The intimate correspondence between what Cleanthes says about the impossibility of seriously acquiescing in complete philosophical scepticism and Hume's own utterances to the same effect in the *Treatise of Human Nature* further helps to indicate that we are not to take Philo's estimate of the theistic arguments as meant to be that of his creator. His function is not to refute Cleanthes, but to call attention to the difficulties and weak points in his exposition.[4] The precise position at the opening of the discussion is this. Cleanthes affirms the existence of a 'cause' of the universe and, reasoning by analogy from the products of art to those of nature, holds that this cause is a mind resembling our own. He denies the doctrine of the Neo-Platonists and Christian theologians that God is absolutely simple and therefore unknowable in His *essentia* to us, on the ground that this amounts to atheism. Philo and Demea are agreed in opposing him, though for different reasons—Demea because he accepts the negative theology, Philo on the ground that, as we have no experience of 'world-making,' we are not entitled to say that the order in the world presupposes a world-building intelligence. Cleanthes has rested his case on the old Platonic argument from 'orderly motion,' but has admitted that the argument is one from analogy. Philo replies that there is no sufficient basis for an analogical argument. He further appeals to the difficulties of the 'infinite regress.' If matter and mind must be effects of a cause, why must not that cause have a more ultimate cause, and so on *ad indefinitum*? Cleanthes declines to consider the problem: 'You ask me what is the cause of this cause? I know not; I care not; that concerns not me. I have found a Deity; and here I stop my enquiry. Let those go farther, who are wiser or more enterprising.' Philo not unnaturally replies: 'I pretend to be neither; and for that very reason, I should never perhaps have attempted to go so far; especially when I am sensible, that I must at last be contented to sit down with the same answer.'[5] Philo, it must be remembered, calls himself a theist, though he professes to regard the nature of God as totally unknown. The point at issue between him and Cleanthes is that Cleanthes maintains that the 'First Cause' is not only a mind but also 'a mind like the human,' and that the teleological argument is an 'experimental proof' of this. These two points are what Philo disputes and Demea regards as 'anthropomorphist' heresy. Philo, in fact, wishes, like Kant, to maintain that speculative theism is dependent upon the validity of the '*a priori* proof.' If we rely solely on the argument from

[1] Cf. Couturat, *La Logique de Leibniz*, Paris, 1901, pp. 224–226, with the passages cited there.

[2] For a useful conspectus of all the more important utterances of Leibniz on the existence of God known before the publication of Couturat's volume of *Opuscules* see Russell, *Crit. Expos. of the Philosophy of Leibniz*, pp. 284–291, and, for a 'smashing,' but by no means final, attack on all the four arguments, ch. ix. of the same work.

[3] That this remark is made in good faith seems clear from Hume's letter to Gilbert Elliot of March 10th, 1751, where he speaks of Cleanthes as the 'hero' of the dialogue and asks his friend for any suggestions which will 'strengthen that side of the dialogue,' protesting against the ascription to himself of 'any propensity to the other side,' by which he plainly means the side of Philo. No one could suspect him of 'propensity' to the side of the 'mystic' Demea.

[1] That Hume was personally an orthodox Christian is, to be sure, unlikely, but there is no reason to suppose that he was much further removed from orthodoxy than more than one of the prominent 18th cent. latitudinarian bishops or Scottish 'moderates,' and in his philosophy he never commits himself to any view not compatible with the completest orthodoxy, as orthodoxy was understood in his day. Huxley's anti-clericalism is quite incompatible with Humianism.

[2] There is a certain want of definiteness about the position ascribed to Demea. He is spoken of as a 'mystic' and a depreciator of the powers of reason; on the other hand, he is the champion of the 'simple and sublime argument *a priori*'—an odd attitude for an irrationalist. Hume does not seem to have distinguished between negative theology, the creation of philosophic rationalists, and the scepticism of despair which arises from sheer distrust of reason. Philo's 'scepticism' is quite another thing, a mere declaration that, 'as at present advised,' he has not sufficient material for a definitive conclusion.

[3] Demea is, in fact, so little of a real theologian that he is unaware that it is actually unorthodox to maintain that the existence of God is known only 'by revelation.' Perhaps, like Hume himself, according to Johnson, 'he had never read the New Testament with attention,' and he almost certainly did not know that his position had been formally condemned by the Fifth Lateran Council.

[4] Huxley's exploitation of Philo for an antitheistic purpose rests on the false assumption that it is he who is the real 'hero of the dialogue.'

[5] Hume, *Philosophical Works*, ed. T. H. Green and T. H. Grose, London, 1874–75, ii. 410.

effect to cause, the known effect is not perfect and we are not entitled to infer that its author is free either from intellectual or from moral deficiencies, or even that 'several deities' may not combine to construct a world as many men co-operate to build a house or a ship. 'A man, who follows your hypothesis, is able, perhaps, to assert, or conjecture, that the universe, sometime, arose from something like design: but beyond that position he cannot ascertain one single circumstance, and is left afterwards to fix every point of his theology, by the utmost licence of fancy and hypothesis.'[1] The God of Cleanthes is, in fact, a 'finite deity,' and a finite deity is as bad as none at all. And, if reasoning by analogy be in place at all, analogy suggests that we should look on the material world as an animal of which God is, as with the Stoics, the soul, and thus we shall be led to affirm the eternity of the world (contrary to the position of Cleanthes, who has tacitly assumed that the thing to be accounted for is its origin). Or, again, if the world is more like an animal or vegetable than a watch or loom, why should we not infer that worlds are propagated rather than made? A comet may be the 'egg' of a solar system. Demea, of course, comments on the absence of any data for such 'wild' theories. But this is exactly the point on which Philo wishes to insist; 'we have no data to establish any system of cosmogony.' He insists, none the less, that such analogies as we have suggest that intelligence itself is caused by physical generation. Generation, itself an unintelligent process, is explained to be a 'principle of order in nature,' and 'we see every day the latter [intelligence] arise from the former [generation], never the former from the latter.' (It is, of course, obvious that Cleanthes is here making two very questionable assumptions—that the 'rational soul' is generated like the body, and that, because an oak or a spider is not rational, the growth of the one and the instinctive behaviour of the other are not guided by intelligence at all. 'Experience' does nothing to assure us of these negations.) Philo finally reaches the climax of his polemic against the *a posteriori* argument when he urges that the 'unguided' motions of material particles may give rise to 'an uniformity of appearance,' and thus 'account for all the appearing wisdom and contrivance' in nature. (As before, he makes the wholly illegitimate assumption that we know from experience that this has really happened. 'This we know to be the case with the universe at present. . . . May we not hope for such a position, or rather be assured of it, from the eternal revolutions of unguided matter?' Of course, experience does not warrant the statement that there is or ever has been 'unguided matter.') He had himself repudiated the notion that chance has any place in a scientific theory, but he ends by suggesting that the only reason why there is order in the world is that 'it happens' so.[2] Cleanthes reasonably retorts that the degree of harmonious adaptation in the known part of the universe to the needs of an intelligent civilization goes far beyond what Philo undertakes to account for—such order as is necessary 'for the subsistence of the species.' But Philo has made the main point for which he was concerned, that the *a posteriori* argument, taken by itself, is not adequate to establish the existence of the all-perfect or 'most real' being. Accordingly the dialogue now proceeds to consider the *a priori* argument by which the existence of the *ens realissimum* is to be established from an analysis of its own nature. The exposition of this argument is given to Demea, the spokesman of traditional theology, and the objections against it are put into the mouth of Cleanthes, the upholder of the argument from design, as well as into that of Philo. We now find Cleanthes and Philo allied against Demea, as we have hitherto had Demea and Philo combining against Cleanthes. The particular argument regarded as conclusive by Demea is one which ought more properly to be called *a posteriori*. It is, in fact, as he words it, a combination of two of the forms of the *a posteriori* argument admitted by St. Thomas—the argument from the fact of motion to a First Mover and the argument from the possible to the necessary. Since the indefinite regress is illegitimate, in arguing from effects to causes, we must come to a First Cause, and, when we ask why the 'succession of causes' should be what it is and not a different series, we are forced to answer that the First Cause is a 'necessarily-existent Being, who carries the *REASON* of his existence in himself; and who cannot be supposed not to exist without an express contradiction.'[3] (This last clause thus gets in the point of the ontological proof under cover of the argument from causality; this may be the justification for calling Demea's reasoning *a priori*. Or Hume may possibly mean that his argument is based simply on the general principle of causality and not on the special character of the effect under consideration, the actual universe.) Cleanthes urges against the proof the five following considerations. (1) No fact can be demonstrated *a priori*. 'Whatever we conceive as existent we can also conceive as non-existent. There is no being, therefore, whose non-existence implies a contradiction. Consequently, there is no being whose existence is demonstrable.' This agrees with Thomas's verdict on Anselm except for the fact that Hume disregards the fine distinction between what is evident *in se* and what is evident *quoad nos*. (2) We cannot know that 'the Deity' is a 'necessarily-existent Being' 'while our faculties remain the same as at present,' and therefore 'the words *necessary existence* have no meaning' to us. Here there seems to be a direct contradiction between Cleanthes and St. Thomas. But on looking more closely we see that Cleanthes is merely repeating his former objection in fresh words. By a 'necessary existence' he means one that cannot be thought of as not existing, and St. Thomas also admits that 'our faculties' do not allow us to perceive that God's existence 'flows from His essence.' St. Thomas's argument only went to show that there is a being who exists always. This contention Cleanthes does not refute, but merely denies without giving a reason; 'nor can the mind ever lie under a necessity of supposing any object to remain always in being.' (3) If there must be a 'necessary being,' or a being which cannot be thought not to exist, why may not 'the material universe' itself be this necessary being? 'For aught we can determine, it may contain some qualities which, were they known, would make its non-existence appear as great a contradiction as that twice two is five.'[1] (4) How can there be a first cause of an 'eternal succession of objects'? (5) In such a 'succession of objects' each may be said to be caused by something that preceded it, but there is no sense in asking for a cause of the whole chain. Demea adds that possibly the 'whole economy of the universe' is 'conducted by a necessity,' undiscoverable to us, which he compares with the arithmetical rule that the sum of the digits of any multiple of 9 is divisible by 9.[2] These reflexions really suggest more than they actually contain. Consideration (4), if thought out, raises the question whether the 'infinite regress' is really an impossibility, and consideration (5) is at least a hint of the more modern doctrine of ultimate pluralism that the universe may consist of a multitude of independent but interrelated constituents. Demea's remark deserves less consideration. It amounts manifestly to the suggestion that the 'material universe' itself may be the 'necessary' being whose existence follows from its 'essence,' and is inconsistent with the objection already urged against the ontological proof, that there is no existent which may not be conceived not to exist.

The discussion now turns to the moral character of the First Cause. Philo and Demea agree in arbitrarily assuming the pessimistic view of the general misery of creation and in particular of man. The case is argued by Philo with an abundance of rhetoric and manifest want of logic which of themselves suggest that Hume is treating him with some irony. That Cleanthes declares that he feels little of this misery himself and hopes that pessimists are not very common is a further indication that it is he who is the spokesman of Hume's own conviction, so far as any of the characters can be said to be so. Demea, of course, means only to infer from the pessimistic estimate of life that the true good of man is not to be found on this side of the grave, and is driven out of the company by disgust when Philo goes on to argue at great length, and with still more obvious begging of the question than before, that all the indications show that the cause or causes of the cosmic order are either incompetent, evil, or indifferent to morality. (It is almost incredible, again, that Hume was not aware that the whole of Philo's eloquence depends on the tacit assumption that nothing is good but pleasure. He merely revives the old Epicurean argument against Providence in its crudest form, and it is no surprise to an intelligent reader when he informs Cleanthes, after Demea's departure, that his real object has been merely to protest against the abuse of the topic of benevolent design by popular preachers. It is not quite so easy to believe him sincere in his assertion that, in spite of all that he has hitherto said, he thinks the evidence of rational design in nature overpowering and regards doubt about the existence of a 'Supreme Intelligence' as 'pertinacious obstinacy.') Philo's final conclusion is that the controversy between theists and atheists is at bottom verbal. The order and design in the world prove that its cause (he quietly abandons his own former objection to the demand for such a cause) bears an analogy, though, no doubt, a remote one, to the human mind. If theists would remember the remoteness and atheists the reality of the analogy, there would be nothing left to dispute. But he objects *in toto* to all 'religion' which goes beyond the intellectual admission of this one proposition (and thus is plainly meant to be insincere in his assertion that his 'philosophical scepticism' is 'the most essential step,' in an educated man, 'towards being a sound, believing Christian'). Deism—bare intellectual affirmation of the existence of an intelligent First Cause which exercises no influence whatever on the practical conduct of life—is manifestly what Philo really means to recommend. (His attack on 'religion' is little more than a denunciation of the 'horrors of the Inquisition' and contains a logical contradiction to which his creator must have been alive. He maintains, on the one hand, that 'religious motives' are so weak, by comparison with others, that 'religion' is impotent to influence conduct for the better, and, on the other, that it is so strong that all the worst evil in life is due to 'priests' who play on the fanaticism of the vulgar for their own interested purposes. It is hard not to believe that Hume is treating his puppet with intentional malice, just as he is treating Demea with malice when he represents him as welcoming Philo's description of the hopeless wretchedness of existence without any suspicion of its drift, though, as an educated man, he must have known what conclusions Lucretius had drawn from the same premisses.) Cleanthes, it is to be noted, listens to this assault on religion almost in silence and leaves Philo with the last word. It is to be supposed that he does not assent, though he may not see his way to 'dissolve the *ἀπορία*.'

15. Kant.—Much more closely knit is the assault on the whole of natural theology in Kant's *Critique of Pure Reason*. It should be remembered that Kant had not always been a disbeliever in the

[1] *Philosophical Works*, p. 414. [2] *Ib.* p. 428. [3] *Ib.* p. 432.

[1] *Philosophical Works*, p. 432. [2] *Ib.* p. 434.

possibility of demonstrating theism. In his thesis for his degree,[1] which aims at showing the irreducibility of the principle of sufficient reason to the logical principle of contradiction, he offers a proof, based on the former principle, that 'there is a being whose existence is antecedent to the possibility of itself and of all things, which being must therefore be said to exist with an absolute necessity.'[2] This is, in principle, the contention most fully developed later by Lotze.

As Kant states it, the argument runs thus. 'Possibility' means the absence of contradiction (*non repugnantia*) between the constituents of a 'complex notion.' The 'constituents' are thus presupposed as the 'matter' of the 'complex notion.' Thus a 'possibility' with no presuppositions, a 'possibility' when nothing whatever has been given as actual, is meaningless. It follows 'that nothing can be conceived as possible unless that which is real in every possible notion exists, and, indeed, exists with absolute necessity (since, if you leave this [reality] out of account, nothing whatever would be possible, *i.e.*, everything would be impossible). Further, he urges, this 'necessary reality' must be a single being. The argument for this is that, if we suppose 'the reals, which are, so to say, the matter of all possible concepts, to be found distributed among many existents' (*i.e.*, if we suppose a plurality of ultimate 'reals'), each 'real' will have limitations, *i.e.* 'privations,' negative characters. But negative characters have not, like positive 'realities,' an 'absolute necessity.' The supposed 'reals' will therefore all contain an element of contingency. The being which exists with absolute necessity must therefore be without any limitations and therefore infinite. (Like Leibniz's God, it must be the subject of every proposition affirming a positive 'perfection.') If there were more than one such infinite being, the very plurality would re-introduce contingency. 'Thus God, and one only God, is given as the absolutely necessary principle of all possibility.' Kant thus, by deducing the existence of God from the principle of sufficient reason, is already anticipating the doctrine of the *Critique* that all existential propositions are synthetic without exception. Descartes' ontological argument is pronounced to be invalid, precisely because it attempts to deduce the 'existence' of God from His 'essence' (thus treating an existential proposition as analytic), whereas, in the proof given by Kant, the 'possibility' of God is itself made to depend on His 'existence.'

Kant returns to the subject in his short essay on *The only Possible Proof of the Being of God*.[3] The proof offered is substantially that of his thesis of 1755, divested of scholastic terminology. Existence is not a predicate or determination of a subject, but the absolute positing of the subject itself; *e.g.*, when I am fully acquainted with the whole story of Julius Caesar and know every predicate of the hero of the story, it is still an intelligible question whether this Julius Caesar is a 'real' man or only the hero of a fiction, and by calling him a 'real' man I do not add an $(n+1)^{th}$ predicate to the n predicates which I have already asserted about him in telling the story. The difference between a 'real' and a merely possible thing lies not in what is posited in each case, but in the way in which it is posited. If I think of a thing first as possible and then as real, the same complex of predicates and relations is posited in both cases; but in the first case this complex is posited hypothetically (a complex of propositions are true about the thing if it exists), in the second case absolutely—*i.e.* categorically. I cannot think of anything as possible unless its predicates are all compatible with one another; *e.g.*, I cannot think of a triangle with four sides as possible, but I can think of a triangle with a right angle as possible. 'Both the triangle and the right angle are the data or material element in this possibility; the agreement of the first with the second in respect to the law of contradiction is the formal element of the possibility.' Since the material element (the data) as well as the formal is required to constitute a possibility, 'the internal possibility of all things presupposes some existence' (*irgend ein Dasein*), and 'it is wholly impossible that absolutely nothing should exist.' (In more modern language this means that the difference between the logically possible and impossible depends on the compossibility of some predicates and the incompossibility of others; thus, that there may be so much as the difference between what is logically impossible and what is possible, there must be predicates, and predicates are predicates of something. Hence there must be something, to be the subject of predicates if the very word 'possible' is to have a meaning.) Thus we get back to the starting-point of the proof of 1755. Possibility logically presupposes actual existence as its foundation. Therefore there is something actual, the elimination of which would destroy all 'internal possibility'; *i.e.* there is 'an unconditionally necessary being.' Kant then proceeds, as in 1755, to prove that the necessary being is one, simple, immutable, and eternal, and, as that which contains the data of all possibilities, is, in fact, the *ens realissimum*. From these attributes it is inferred that 'the necessary being is a spirit (*Geist*),' and this completes the proof that God exists.

It still remains for Kant to show that his form of the argument 'from the possible to the necessary' is the only valid theistic proof. The Cartesian proof of the fifth *Meditation* is set aside on the ground that it treats existence as a predicate. The familiar argument from the contingency of the world (the world is an effect, therefore it has a cause which is itself uncaused and therefore 'necessary') is unsatisfactory. Kant allows in this essay, as he does not in the *Critique*, that the inference to an uncaused First Cause may be valid. It is not so clear that 'this independent thing is unconditionally necessary,' *i.e.* that it cannot even be thought not to exist, since the demonstration of this turns on the principle of sufficient reason, which is not admitted by all philosophers. But, even if the point be conceded for the sake of argument, it is not proved that the absolutely necessary being is what we mean by God, *i.e.* is utterly perfect and utterly One. To establish this point (that 'the necessary being=the perfect being') we require to prove that, 'if X is perfect, X necessarily exists,' and this is just the ontological argument, with its treatment of existence as one predicate among others, over again (a point on which Kant expatiates more fully in the *Critique*). The teleological or, as Kant calls it, the physico-theological proof here, as in the *Critique*, comes off better. Like Hume's Philo (in one of his moods), Kant is convinced that there is such evident system, adaptation, and benevolence in nature that its author must be thought of as One, wise, and good. But, though the argument deserves to be enforced in the interests of practical piety, it is not enough to prove perfect wisdom or benevolence in the Creator, and thus not enough to prove that He is all we mean by God. The same criticism will meet us again in the *Critique*.

The argument for the dependence of the world on a 'necessarily existing being' recurs again, in a slightly different form, in a third 'precritical' work—Kant's inaugural lecture as professor on 'The Form and Principles of the Sensible and Intelligible World.'[1] As in the two works already considered, Kant assumes the Leibnizian conception of the universe as a complex of simple substances or monads. His object is to show that such a complex must depend for its existence and character upon a supreme and 'necessary' extramundane 'substance,' which is God. The theistic argument is more specially contained in §§ 17–22, and runs as follows. The principles of interrelation between a plurality of substances cannot have their complete ground in the existence of these substances. Each substance is indebted for its mere subsistence only to its cause (if it has a cause). But the relation of effect to cause is not *commercium* (reciprocal interaction), but *dependentia* (one-sided dependence), and what we have to account for is the *commercium* of the substances which make up the universe. Not all these substances can be 'necessary,' because, if they were, they would be absolutely without dependence on each other; there would be no *commercium* between them, and they would not form a world at all. The world, or 'totality

of substances,' is, therefore, a 'totality of contingents'; and 'the world, in virtue of its essence, consists of mere contingents. Moreover, no necessary substance is connected with the world (*mundus*) at all, unless as cause with effect, and therefore not as a part with a whole, since the parts of one and the same whole are connected by reciprocal dependence, a relation which does not affect a necessary being. The cause of the world, then, is an extra-mundane being and not a "soul of the world."' And the necessary being which is the extra-mundane cause of the world is one and not many. For the effects of different 'necessary beings' would stand in no relations of reciprocal dependence, since their assumed causes are not reciprocally inter-related. Hence the unity of the substances composing the world in a single system is a consequence of the dependence of them all on one being, and it follows that this one being is not a mere 'architect of the universe' (*i.e.* δημιουργός), but its Creator. Incidentally also the argument removes the ambiguity which had haunted Leibniz's account of the 'pre-established harmony' to God. It definitely makes the harmony itself dependent on God.[1]

Thus down to 1770 Kant shows no doubt of the possibility of demonstrating theism. The argument on which he relies in all the essays examined is one and the same—the Neo-Platonic argument *a posteriori*—and rests on the assumption that the world as given is an object for which we are bound by the principle of causality to seek an explanation.[2] The proof, as with the Neo-Platonists, aims at establishing the existence of the One—the single, internally simple and perfect, extra-mundane source of all the existents which together make up the κόσμος. The peculiarity of Kant's special version of it is that, to escape the criticisms which had been directed against Descartes, he sets himself to deduce the existence of a 'being which cannot be thought not to exist,' not from the logical concept of *ens realissimum*, but from the consideration that, in the universe itself, some combinations of predicates of the same thing and some combinations of relations between the same things are possible, and others not. The existence of an actual extra-mundane being once established as a pre-condition of the difference in intra-mundane things between what is possible and what is impossible, the internal unity, simplicity, and perfection of the necessary being are then deduced as consequences of its necessary existence. If this line of argument is not fallacious—*i.e.* if it really proves that something 'exists of necessity'—it clearly has the double merit of being free from the objection to the ontological proof, and of being equally untouched by the considerations urged by Philo and Demea in Hume against the *a posteriori* proof. If the principle on which Kant relies—that the possible presupposes the actual—is sound, his argument seems to be a complete speculative demonstration of the 'being of God' reduced to its most succinct expression. Why, then, did Kant, in his later 'critical' years, pronounce the question whether God exists to be transcendent—*i.e.* outside the legitimate limits of speculative investigation—and all 'proofs of the existence of God,' including that for which he had himself formerly claimed 'geometrical certainty,' mere fallacies?

In dealing with Kant's drastic assault on speculative natural theology in the *Critique of Pure Reason*, we may perhaps distinguish two questions which Kant himself naturally treated as one. It is one question whether Kant has proved that the demonstration of theism is impossible on the assumption that the special doctrine of his *Critique* as to the limits of human knowledge is true, but quite another question whether that doctrine *is* true, and consequently whether Kant has proved the fallaciousness of natural theology unconditionally. The first of these two questions no doubt permits of only one answer. Kant is clearly right when he asserts that all existential propositions are synthetic, at any rate (to repeat the distinction of St. Thomas to which Kant himself pays no regard) *quoad nos*. And it follows at once from this single consideration that, if, as the *Critique* maintains, the synthesis in a synthetical proposition must always in the end be effected by an application of formal 'categories of the understanding' to a material supplied in sensation or sensuous imagination, no synthetical proposition (and, by consequence, no existential proposition) can be affirmed of a subject which is purely 'intelligible,' a νοητόν. And Kant expressly makes this a main point in his criticism of the ontological proof. Unfortunately, however, this doctrine, if carried out to its full logical consequences, would lead to a result which Kant would have been the first to reject. For it follows that there can be no such sciences as pure arithmetic and pure geometry. The subjects about which synthetical propositions are asserted in these sciences are one and all *Objekte des reinen Denkens* no less than the *ens necessarium* or the *ens realissimum* of speculative theology. No element whatever supplied by sense enters into the mathematician's concept of a circle, a parabola, an integer, or a real number. Kant overlooks this all-important point because he assumes throughout his whole reasoning that, before I can demonstrate a proposition in geometry, I must draw the figure, and similarly that, before I can say what the sum of two integers is, I must count the units of which he supposes the integers to consist. The erroneous character of this view has been sufficiently demonstrated by the subsequent history of mathematical science, but ought to have been clear to Kant himself. Even if all geometry, as he tacitly assumes, were metrical geometry, he ought to have seen that Descartes' invention of co-ordinates had already made the drawing of figures in principle superfluous in geometrical science. His conception of arithmetic is even more superficial—in fact, on a level with Aristotle's. As Couturat has correctly observed, Kant's examples are all drawn from the demonstration of singular propositions (such as $7+5=12$). If he had asked himself how any general truth in the theory of numbers is proved (how, *e.g.*, we prove Fermat's theorem), he would have seen at once the inadequacy of his own theories. Indeed, mere consideration of a singular proposition which does not relate to integers (*e.g.*, the proposition $2{\cdot}5+3{\cdot}6=6{\cdot}1\dot{6}$) might have taught him that arithmetic is not the same thing as counting, and even suggested to him that an integer is not a 'collection of units.'

With the discrediting of Kant's 'Transcendental Aesthetic' and the section of the 'Transcendental Dialectic' containing the famous antinomies, which may now be fairly regarded as a *fait accompli*, our task becomes the comparatively simple one of considering whether natural theology does or does not involve (as Kant alleges that it does) an illegitimate use of the principles of pure logic. From Kant's point of view, to be sure, it does. But this is just because Kant assumes that the only legitimate use of logical principles is their employment to order a material given by sense. If the doctrine of his 'Aesthetic' is rejected, and with it that part of the 'Dialectic' in which he absurdly tries to show that the mathematical doctrine of infinite series leads to antinomies,[1] it is no longer obvious that what Kant calls a transcendent employment of the principles of logic—*i.e.* their employment independently of application to 'the manifold' of sense—need be illegitimate. In fact, it is not clear that the whole of the general theory of arithmetic is not just such an employment of logical principles as 'constitutive of a *Denkobjekte*.' (It is certainly so if, as is probably the case, the series of natural integers can be defined wholly in terms of the primitive indefinables of logic.) One Kantian paralogism, in particular, may be noticed here, as it plays a prominent part in the assault on the theistic arguments. Kant complains that all the arguments for the 'necessary being' based on the causal principle depend on employing this principle, which is a mere rule for ordering the appearances of the sensible world, and has no meaning apart from these appearances, as a means of transcending the world of sense.[2] It might be a sufficient retort that the one form of causality with which we are intimately acquainted is our own volitional activity. In this activity, which is at once efficient and intentional causality, what are connected as cause and effect are not an earlier and a later event in the 'world of sensible appearances,' but the self, which does not belong to that 'world' at all, and an event

[1] 'Commercium itaque omnium substantiarum universi est externe stabilitum per causam omnium communem' (*ib.* p. 22).
[2] Philo, in Hume, it will be remembered, had at least suggested that this need not be the case; the material world may be its own explanation.

[1] On the absurdity of all this see, in particular, the crushing exposure of Couturat, *De l'Infini mathématique*, Paris, 1896, bk. iv. ch. 4.
[2] *Kritik der reinen Vernunft*[2], Riga, 1787, p. 687.

which does belong to it. Kant could not deny the causal relation between the rational self and events in the *Sinnenwelt* without ruining the foundations of his own ethics, but the admission of such causality ought to debar him from attacking natural theology on the ground that it 'uses the principle of causality as a means to transcend the world of the senses.' He only escapes open self-contradiction by his monstrous theory, which is not likely to find a defender at the present day, that the self with which we are acquainted is not the real self at all, but a phenomenal self apprehended by an inner sense. From the point of view of logic, the criticism is equivalent to a refusal to admit the validity of any logical inference from the terms of a series to a limit which is not itself a term of the series. It is not in itself any more absurd to hold that examination of the things and events of the *Sinnenwelt* in the light of the causal principle reveals their dependence on something which does not belong to that world than it is to hold that a series of which every term is a rational fraction can be shown to have a limit which is not a rational fraction. (This is, *e.g.*, the case when we represent a surd 'square root' as a recurrent continued fraction. Each of the 'convergents' is a rational fraction, but the limit of the series is not.) The general argument is thus invalid. No *a priori* reason can be given why the causal principle should not enable us to transcend the world of sense, and the only real question which remains is whether the particular arguments of theists will stand scrutiny on their merits. There is no general logical presumption against them of the kind Kant imagines.

We are thus brought to the consideration of the force of Kant's attack on natural theology taken by itself and apart from its connexion with a general theory of the nature of scientific knowledge which is certainly erroneous. We may therefore confine ourselves to the sections of the *Critique of Pure Reason* which profess to make a complete enumeration of the possible proofs of the existence of God and to convict each of the 'proofs' of fallacy, together with the 'Critique of all Speculative Theology,' in which Kant sums up his results.[1] The general line of argument is as follows. The scientific interpretation of facts consists in regarding any given actual condition of things as conditioned and asking for the antecedent facts which condition it. When they have been found, science once more requires an interpretation of them on the same lines, and so on *in indefinitum*. Every set of facts has thus to be regarded by the scientific intellect as conditioned by an antecedent state of things which has, in its turn, to be discovered. The scientific 'explanation' of the world is thus a task which, from its nature, can never be completed. Behind every set of conditions, however remote, at which we may arrive there is always a body of still more remote conditions to be discovered. (The conditions, in every case, like the facts they condition, are facts and processes of the *Sinnenwelt*.) The unending regress from conditioned to conditions, however, naturally suggests the thought that the process of explanation would be completed if we could find something ultimate, itself unconditioned but the condition of everything else. Thus we arrive at the notion of a being which 'exists necessarily' and contains in itself the explanation of everything else, the one and only being which is not contingent (*i.e.* a consequence of something other than itself). Next, it occurs to us that, if there is such a 'necessarily existing' being, it must, as the condition of everything else, contain in itself all that is truly real or positive; what is real in all limited and finite things must come to them from it. Thus we identify the *ens necessarium* with the *ens realissimum* ('*dasjenige was alle Realität enthält*'). Finally, since we ourselves, who are among the things dependent on this being, are intelligent moral persons, we 'personify' this being, and thus we arrive at the conception of God as the Supreme Being and source of the world. But the whole process has no scientific worth. The inference to the existence of a 'necessary being' is invalid because it employs the causal principle, which is really only a rule for the interconnexion of sensible events, as a means of connecting the sensible with the intelligible (a general criticism which has already been considered in the last paragraph); we have no positive conception whatever of the character of this necessary being (supposing it to exist), and the attempt to find one by identifying it with the 'most real being' will not stand examination, since it is logically possible that there might be a plurality of 'necessary' beings, each imperfect and finite (one may illustrate by the theory that 'ultimate reality' is a 'society' of unoriginate 'persons' without any Creator); and the attempt to prove the existence of a single 'most real being' directly is a pure sophism. The conclusion then is that, though speculation may suggest to us the possibility that God (conceived after the fashion of the Neo-Platonic 'One') is the source of the world, it can do no more. It cannot even prove that the possibility is more than 'logical'; *i.e.*, speculation may convince us that there is no internal contradiction in the notion of such a being; it cannot show that God is a 'real' possibility—*i.e.*, that there is no incompatibility between the existence of God and the actual facts of the world of experience, if we knew them all instead of being aware of a mere fragment of them. The whole value of speculative theism is to suggest this mere possibility, to warn us that we are not speculatively justified in regarding the sensible world as underived, but must keep an open mind. If, however, apart from all speculative philosophy, there are *practical* grounds for believing in God—*i.e.*, if the reality of absolute moral obligation can only be made intelligible by appeal to our dependence on God—then, for practical purposes, the open possibility is converted into a moral certainty. Kant means, as he explains,[1] that, in shaping the conduct of our lives, *il faut parier*. We must act either on the assumption that moral obligation is absolute or on the assumption that it is not; there is no third course. But all moral obligation, as is shown at length in the *Grundlegung zur Metaphysik der Sitten*,[2] is absolute, and there is no fact more certain than this. Without God as ruler of the world, however, the system of absolute obligations would be a logically flawless construction ('*in der Idee der Vernunft ganz richtig*'), but would have no 'reality of application to ourselves, *i.e.* would be without motives.'[3] A virtuous man is thus necessitated to a firm rational belief in theism, but that which makes the necessity is not the demonstrative force of the theistic arguments (which in fact is zero), but the virtuous man's immediate conviction of the absoluteness of moral obligations. This is what Kant meant when he described himself as abolishing knowledge to make room for faith.[4] If our unfavourable judgment on the 'Transcendental Aesthetic' is justified, we plainly cannot concede to Kant that all speculative theism must be baseless. The theistic arguments must be scrutinized on their merits, not condemned *en bloc* like the generals at Arginusae. With his usual love for formal schematism Kant urges that there can be three and only three ways of trying to prove the existence of the Supreme. We may attempt to

[4] He must not be understood in a pragmatist sense. He did not mean that the existence of God is a speculation which a man may accept or decline 'at his own risk,' may adopt 'because up to the present it works,' or because inferences can be drawn from it which gratify the believer. The faith of which he speaks has its foundation in the conviction that the law of duty is absolute, and this proposition is admitted by the good man not as an 'hypothesis accepted at his own risk to see whether it works,' or because he chooses to accept it, but because, being a good man, he sees it to be true and certain.

prove the existence of the 'most real being' entirely *a priori* (*i.e.* without the use of any 'truth of fact' as a premiss) by arguing that existence is included in its very nature—the ontological proof; we may, departing from the strictly *a priori* method, employ the single truth of fact, 'something exists,' as one of our premisses, and then argue to the conclusion that a 'necessary being' exists—the cosmological proof; we may include among our premisses specific assertions about the character of the 'something that exists'; *i.e.*, we may argue from the marks of intelligent and benevolent design in the actual world to intelligence and benevolence in its source—the physico-theological proof. Each of these proofs is now to be shown unsatisfactory. The first is a pure verbal sophism and the second no better, and, as proofs of the existence of God, both the second and third have to be eked out by a silent combination with the first.

The refutation of the 'ontological' proof is one of the best-known passages of the *Critique of Pure Reason*. Kant speaks of the argument as the 'ontological (or Cartesian) proof.' He examines it only in the form in which it had been revived by Descartes, and was apparently not acquainted with its earlier history. His objection, put briefly, is simply this, that the proposition 'God exists' can only be got out of the concept of 'God' if existence has already been included in that concept. If I define God as a 'really existing *X*,' of course I can make the true proposition, 'If there is such a being as the God thus defined, then that being exists.' But I am not entitled to assert that there is such a being, and consequently not entitled to assert the consequent of the foregoing hypothetical proposition ('God exists') categorically. In fact existence is not a real predicate. The concept 'a hundred dollars' has precisely the same content whether the hundred dollars actually exist in my pocket or not. 'Our concept of an object may contain what and as much as you please, still we must go outside it to impart existence to the object.'[1] Hence the ontological proof is not really a proof of anything. 'The Idea of a Supreme Being is in many respects a most useful Idea, but just because it is merely an Idea it is wholly incapable of extending our knowledge of what exists by means of itself alone.'[2] Since Hegel undertook to rehabilitate the argument, it has been fashionable to retort on Kant that, though it may be true that the real existence of a sum of a hundred dollars cannot be inferred from analysis of the corresponding concept, the case is wholly altered when we come to deal with the unique and exalted concept of the Supreme Being. The present writer does not feel that Hegel's witticisms on this point are any answer to Kant's criticism. Kant is certainly right in saying that mere success in defining a concept without contradiction does not in general warrant our asserting that the concept has an 'extension.' The logical investigations which have issued in the creation of the modern 'exact' or 'symbolic' logic of Frege, Peano, and Russell have made this point even clearer than it could have been to the first readers of the *Critique*. If it is immediately evident that there is a member of the unit-class of which 'supreme being' is the class-name, there is neither room nor need for proof. If this is not immediately evident, proof is wanted. In general it cannot be inferred from the definition of a class that the class has members. If the class 'supreme being' or 'most real being' is an exception, we require proof that it is an exception to the rule, and neither Hegel nor any one else has ever offered anything in the way of proof. Thus, as against Descartes, Kant's argument is, in the present writer's opinion, decisive. Nor does he see that the original Anselmian proof fares any better. It is not directly touched by Kant's denial that existence is a predicate, since Anselm does not rest his case on the assertion that existence is a predicate. But Kant's counter-argument can equally be stated without raising this question. Whether existence is a predicate or not, it is equally true that we are not entitled to infer from the hypothetical proposition, 'If there is a God, that God is an existent,' the categorical proposition, 'God is an existent'; and this is what Anselm tries to do. He is really committed, as every defender of the ontological line of argument must be, to the attempt to prove that it is irrational to suppose that there might have existed nothing at all. In point of fact most of those who have tried to turn the edge of Kant's criticism have not attempted so desperate a task. They have consciously or unconsciously assumed as a premiss the proposition that something exists, and have been content to argue that, since something exists, God exists also. In doing this they tacitly admit the truth of the contention of Kant and St. Thomas that no purely *a priori* proof of theism is possible.

Kant's attack on the cosmological proof is more elaborate and, in the present writer's opinion, less successful. The rejection of the ontological proof does not depend in the least on the acceptance of the peculiar theory of knowledge expounded in the *Critique*. The proof had been rightly treated as a sophism in all the precritical essays in which Kant deals with the foundations of natural theology. The case of the cosmological argument is different; Kant's own precritical proof, based on the need for an actual ground of real possibility, was itself a form of the cosmological proof, and is thus among the inferences now rejected as illegitimate. We may therefore expect to find that the rejection of this type of argument does depend on the special critical theory of the limits of human knowledge, and is thus only valid on the hypothesis that the doctrines of the *Critique* are accepted. The typical form of the proof as stated in the *Critique* for examination is this: (*a*) If anything exists, an absolutely necessary being exists; but at least one thing (viz. myself) exists; *ergo* an absolutely necessary being exists; (*b*) a necessary being must be completely determined by its concept; the only concept which thus completely determines an object is the concept of the *ens realissimum*; *ergo* the concept of the *ens realissimum* is the only one by means of which a necessary being can be thought; *i.e.*, a Supreme Being necessarily exists. The argument thus consists of two stages: first, the proof that, because at least one thing exists, a necessary being exists, and, second, the proof that a necessary being can only be the Supreme Being.

Kant denounces this cosmological argument with special vehemence, as was only natural in one who had until his late middle age built on it with perfect confidence and then come to distrust it. His tone in criticizing it is not unlike that of a rather unscrupulous attorney determined to secure a verdict against the accused party by fair means or foul. He begins by a charge of general fraudulence. The cosmological proof professes to appeal to experience, but it is really only the old discredited ontological argument dishonestly disguised. For it only uses the appeal to experience to establish the result: 'There is *a* being which exists necessarily.' When we ask what this being is, we are referred back to the *ens realissimum* as the only thing which meets the requirements of the case. Therefore 'it is only the ontological proof from mere concepts which contains the force of the demonstration and the alleged experience is wholly superfluous.'[1]

The complaint is surely unfair. The objection to the ontological argument did not lie in the concept of the *ens realissimum*, but merely in the absence of an existential premiss. If, then, the new argument supplies the missing existential premiss, it is no objection to it to say that the necessary being of which it speaks turns out to be the *ens realissimum*. The only legitimate objection would be that the argument does not actually supply such an existential premiss as is really needed. This is what Kant next proceeds to urge.[2] He complains that it ought to be shown that the necessary being is the *ens realissimum*. To prove this, we require to establish two propositions, of which one is the simple converse of the other: (*a*) every necessary being is an *ens realissimum*, (*b*) every *ens realissimum* is a necessary being. But this second proposition is 'determined merely by *a priori* concepts,' and therefore 'the mere concept of the most real being' must be the ground for ascribing to it necessary existence. Thus we commit the fallacy of the ontological proof, the establishment of a proposition by mere analysis of concepts. This criticism seems wholly *verfehlt*. The real objection to the ontological proof was that it aimed at proving an existential proposition by mere analysis of concepts. There can be no logical objection to the attempt to prove by such analysis the hypothetical proposition, 'If anything is an (or the) *ens realissimum*, it is *ens necessarium*,' or the simple converse, 'If anything is *ens necessarium*, it is also *ens realissimum*.' Both these propositions are implications, not assertions of existence; the existential import is brought into the cosmological argument entirely by the preceding proof, or attempted proof, that, if anything exists (as we know to be the case), a necessary being exists. Kant is entitled to contend that this has not been proved; he is entitled to contend that the equivalence of *ens necessarium* and *ens realissimum* has not been made out. He is not entitled to treat the fact that the equivalence is an equivalence of concepts as proof of this second charge. Up to this point he is merely following the recommendation to give a dog a bad name and trust to its hanging him. We now come to the really relevant part of his onslaught. This consists of the following allegations: (1) the inference from the contingent to its cause has a meaning only in the sensible world, but the principle of causality is used in this proof to transcend the sensible world; (2) the argument from the impossibility of an infinite series of causes in the sensible world to a first cause is illegitimate; (3) the very notion of necessity presupposes conditions upon which the necessity in question depends, and it is therefore impermissible to cut short the regress from proximate to more ultimate conditions by the really empty concept of an unconditioned necessity; (4) the proof confuses the mere logical possibility of a concept (absence of internal contradiction) with its transcendental possibility, which 'requires a principle establishing the possibility of performing such a synthesis,' but this latter can only be established 'in the field of possible experiences.' All these objections are valid only on the hypothesis that the Kantian theories about the limits of scientific knowledge are true, and it has already been contended that this hypothesis (involving, as it does, the acceptance of the 'Transcendental Aesthetic' and the consequent recognition of the antinomies of the 'Transcendental Dialectic' as inevitable) is certainly false. In particular, it may be replied to (1) that all use of the principle of causality involves transcending the sensible world; consistent phenomenalism, as the work of such writers as Mach, Pearson, Avenarius, abundantly shows, is bound to eliminate

[1] *Kritik der reinen Vernunft*[2], p. 629. [2] *Ib.*

[1] *Kritik der reinen Vernunft*[2], p. 635. [2] *Ib.* p. 636.

the category of causality from science; to (2) that the 'cosmological argument' is not an argument from the impossibility of an infinite series of events at all. In fact it has been often maintained by thinkers who, like Aristotle, deny that the series of events has a first term, or, like St. Thomas, hold that it can only be known by revelation whether the series has a first term or not. The real bearing of the argument cannot be seen at all, so long as we think of causality, as Kant does throughout the *Critique*, as a mere rule of uniform connexion between earlier and later events. Its real foundation is in the conception of efficient causality (activity or agency). The point of the argument is that, if there is not a First Mover or First Agent (or 'movers' or 'agents' in the plural, as the case may be), the whole history of the world is a mere accident. Things are what they are because there 'happen to be' such and such agents, and the reason why there are just these agents and no others is that there 'happen to be' (or 'to have been') certain others by which the set first mentioned have been produced, and so on *in indefinitum*. This means that there might just as well have been no world at all, or one quite different from that which there is. An ultimate pluralistic realism, no doubt, might maintain this thesis, and we shall have to face it in the sequel. But it is an *ignoratio elenchi* to defend it by assuming phenomenalism *plus* an erroneous theory of the mathematical meaning of infinite series. The phenomenalism is further in flat contradiction with the presuppositions of Kantian ethics, for which it is indispensable that every human self shall be a 'first cause' of its own morally and legally imputable acts. If 'first cause' really means nothing intelligible, Kant's practical philosophy is no better than an idle sporting with insignificant words. One must add that the full force of the cosmological argument is only seen when it is combined with the argument from intentional causality. If the historical world-process has a meaning of any kind, whether its meaning lies in the direction of events towards an end or result or in their internal, quasi-aesthetic harmony, the explanation of it cannot, in the end, be merely that the constituents of the universe happen to be what they are. An ultimate pluralism must, to be consistent, deny that there is any meaning at all in the world-process. But, again, the Kantian phenomenalism affords no valid reason for entertaining this view. As to the last point, it does depend on the special principles of the critical philosophy, and, in particular, on the theory that an appeal to the senses lies at the root of all valid synthetic propositions. As has already been remarked, this theory is sufficiently disposed of by the simple consideration that every proposition in the theory of numbers is synthetic in Kant's sense of the word. In the present writer's opinion, then, Kant's attack on the cosmological argument (which he himself clearly regards as the central feature of his general assault on speculative theism) is a complete failure. He proves neither that the argument from the fact of existence to the existence of a 'necessary being' is fallacious nor that there is any sophism in the reasoning by which he himself had formerly established the equivalence of the 'necessary being' with the perfect or 'most real' being. This does not, of itself, prove that the cosmological argument is valid, but it does prove, if the remarks just made are in principle sound, that Kant's objections to the argument are unfounded. Even the complaint that we have no positive conception of either 'necessary' or 'most real' being only amounts to the true assertion that we do not know what it would be like to be God—a proposition which no reasonable theist, least of all an orthodox Christian theologian, need be concerned to deny. For the matter of that, I do not know what it would be like to be my cat, but that is surely an insufficient reason for denying the existence of my cat's mind.

Kant's treatment of the argument from intentional causality—the physico-theological proof, as he calls it—may be summarized more briefly. This argument, which he reduces to the argument from design, he regards with great respect as the most ancient, most obvious, and soundest of all. He assumes it as an undoubted fact that nature, so far as we know it, exhibits all the marks of intelligent purpose, and admits that it is correct to argue from such marks to a designing intelligence. It does not occur to him to explain away the appearances of order and purpose as merely apparent or as the results of anything in the nature of a struggle for existence. He is content to call attention to the limitations imposed on the argument by the imperfection of our knowledge of nature. It is only a part of nature with which we are acquainted, and any inference from the orderliness and purposiveness of that part to thoroughgoing order and purpose in nature everywhere has at best a degree of probability which falls short of certainty. We cannot therefore be sure even of the unity of the designing intelligence, since we do not know that, if all the empirical facts were before us, they would show absolute singleness of design. Even if we knew all the empirical facts, and knew that they all showed perfect unity of purpose, we could only infer that the intelligence which designed the natural order was very wise, very good, very powerful. We could not argue from any knowledge of empirical facts to infinite wisdom, etc. In particular, we only detect intelligence in the arrangement of the 'stuff' of the world, and thus, even if we knew all the facts, we could not use them as a proof of the existence of the Supreme Being, but at most as a proof of the existence of a demiurge or 'architect of the universe.' Thus, if a theologian appears to demonstrate the existence of God by the appeal to design in nature, it is only because he is illegitimately supplementing his reasoning by a concealed appeal to the ontological argument. In these criticisms, in which Kant is manifestly justified, he is, of course, urging considerations with which Hume had already made Philo confront Cleanthes. It is abundantly manifest that no empirical reasoning can establish the existence of a Supreme Being. Kant's final result, stated with his usual love for pedantic formal distinctions, is given in the section of the *Critique* which bears the special title 'Critique of all Theology based on Speculative Principles of Reason.' Theology, we are told, may be based on revelation or on mere reason. Rational theology, again, may think of its object (God) either as *ens realissimum* without further specification or with a further determination as the Supreme Intelligence. The first is transcendental theology, and its supporters may be called deists; the second is natural theology and is the doctrine of the theist. Natural theology, once more, may conceive God as the source of the order that actually exists (the natural order) or as the source of an order that ought to exist (moral order). It is only consideration of the latter that really gives us a right to postulate the existence of a Supreme Being; speculative theology, which attempts to establish the existence of God as required to explain the order of nature, is, as we have seen, condemned to failure, because it seeks to prove the reality of a being which cannot be an object of possible experience. Its value is simply that it shows us that there is no logical impossibility inherent in the notion of a Supreme Being. Thus it forbids us to assert that we know that there is no God, or that, if there is, He is not an intelligent being or is imperfect and limited like ourselves (it saves us from dogmatic atheism, deism, and anthropomorphism), and thus leaves us free to maintain the existence of a supreme spiritual principle, if the moral order proves to be unintelligible apart from the postulate that such a principle exists. For the present it may suffice to make two observations on this. The denial that God is an object of possible experience depends, of course, on taking a specific view of what is meant by experience. If it is indispensable to an experience that it should have an object into which sense-data enter as constituents (and this is what Kant always assumes), manifestly God cannot be experienced. But it may be observed that it is no ground of objection to speculative theology in particular to say that it claims to give us knowledge about a being which is not an object of 'possible experience' in this sense. The same thing is equally true of arithmetic or any other part of pure mathematics. The integers, *e.g.*, are not objects of experience in this sense; still less would it be possible to maintain that, when one utters the well-known proposition, 'Every integer can be represented as the sum of four squares, of which—except in the case of the integer 0—one at least is not 0,' one is not transcending possible experience. It would be quite impossible to verify the proposition by examining its validity for each successive integer (since there is an infinite number of them). Wherever I make a statement about a class with an infinity of members, I am dealing with an object which is not, in Kant's sense of the words, an 'object of a possible experience.' His doctrine reposes on the theory of his 'Aesthetic' that, in the case of arithmetical propositions, I can justify such an assertion by counting. But, though I could, *e.g.*, prove the proposition quoted to hold good for a few cases by actual counting, I manifestly cannot verify it or any other general proposition of the science by this method of appealing to intuition. Again, we may fairly ask why experience should be assumed to be concerned only with objects which fall under the 'forms of intuition.' Why are the saint's moments of vision to be from the outset excluded from experience? If they are included, the statement that God is not an object of possible experience at once becomes questionable. It is a standing defect of the *Critique* that the concept of experience itself has never been subjected by Kant to careful and searching criticism. The second observation which naturally suggests itself is that the sharp opposition between speculation and practice might prove on a closer examination to be misleading. All that Kant can claim to have shown, even if every one of his charges against natural theology could be sustained, is that the facts of physical nature do not warrant the theistic hypothesis. But it is surely as much part of the task of a speculative philosophy to explain the facts of the moral as it is to explain the facts of the physical order. The absoluteness of moral obligations is a fact of the moral order, and, if this fact is only intelligible from the theistic standpoint, then it may fairly be said that speculative philosophy is committed to theism. This was, indeed, Kant's own conviction, and his hard and fast severance between speculation and practice does less than justice to the view he intends to maintain. It gives rise to the misleading suggestion that he regards theism as a doctrine which is doubtfully true but had better be taught to the proletariat with a view to keeping them out of mischief and making them conveniently submissive to their 'betters.' This was not in the least what Kant meant, but his unfortunate verbal distinction between theory and practice is what gave colour to the jest of Heine that after abolishing God in the first *Critique* Kant revived Him in the second in the interest of his old butler's morals, as well as to the strange view of Bernard Bosanquet[1] that Kant's theism is an 'unessential survival.'

It would be wholly unjust to Kant to confine our attention to the destructive side of his treatment of philosophic theism; even more important is his positive teaching, which will be found most fully expressed in the *Kritik der praktischen Vernunft*.[2] If Kant's object was to destroy the

[1] *Essays and Addresses*, London, 1889, p. 129.
[2] Riga, 1788 (*Werke*, v. 116–153).

old speculative natural theology, it is even more his purpose to replace it by a positive moral theology, and it is probably true to say that it is primarily due to his influence that in our own time it is mainly upon the moral argument that popular theistic philosophy continues to base itself. As the Kantian moral theology has often been very imperfectly understood by its critics, it is necessary to state Kant's real position rather carefully, in order to put in the clearest light the differences between Kant and those who hold that the existence of God remains after all a 'pious opinion,' suggested but not established by the facts of the moral life, or those who hold that it is a doctrine recommended mainly by its comforting character. To appreciate the strength of Kant's position, it is necessary to understand that theism is not in any sense an arbitrary hypothesis tacked on to a system of ethics, or, as Bosanquet calls it, a 'survival' of belated superstition, but a logically necessary part of 'practical' philosophy. The argument starts from premisses which are taken as once for all established in the *Grundlegung zur Metaphysik der Sitten* and the *Analytic of Practical Reason*.[1] These premisses are as follows. The object which all moral action has in view is the realization of the highest or complete good. The complete good means a state of things in which the reasonable will finds full and complete satisfaction. Such a state of things implies two constituents: virtue (a right state of the will itself), and happiness (by which Kant means, as he says, a condition of things in complete accord with the rational will, *i.e.* the successful domination of rational will in the universe). If only the first constituent were real, *i.e.*, if the will of every rational being were morally wholly good, this would not of itself be enough to satisfy the demands of the rational will itself. We should not think a universe satisfactory or rational if it consisted of beings of perfect morality whose volitions were always defeated and disappointed by the course of things. The only condition of things which would satisfy our rational demand for the triumph of the virtuous will would be one in which every rational being should be happy (*i.e.* should find his volition effective), in proportion to the moral goodness of his will. The highest good—the object of the moral will—is thus a union of virtue with happiness, but a union in which the inner virtue of the agent is the condition and cause of his happiness.[2] So the highest good means a condition of existence in which a rational being is (*a*) deserving of happiness, deserving that his 'will be done, as in heaven so in earth,'[3] and (*b*) has the happiness which he deserves as a consequence of his deserving it. (More briefly, the highest good is that the actual order of things should be a moral order.) But—and here comes in the antinomy which Kant thinks indispensable in a *Critique*—the principle, as distinguished from the object, of the virtuous will is always to act from reverence for the unconditional obligatoriness of the moral law, without any consideration of the results of our conduct. We must, as moral beings, will the highest good, yet we must also, as moral beings, will to do right for its own sake, without even asking the question whether our right actions will result in bringing about this good or not. We cannot escape from this antinomy, as Kant holds we can from those of speculative reason, by dismissing it as illusory. For we are under absolute obligation to be virtuous, and we cannot be really virtuous without desiring the highest good, nor yet can we be really virtuous if we allow this desire to affect our will to do right because it is right, regardless of consequences. Thus, if morality is to be more than an empty dream, the union of virtue and happiness must be realized, though we must not set ourselves to realize it by treating virtuous action as a means to it. The realization of the union must be brought about for us, not by us. Now, experience shows abundantly that in the empirically known system of nature there is no dependence of happiness on virtue. The most virtuous man is not regularly the man whose will is actually done 'in earth,' nor the man whose will is done the man whose volitions are morally purest. The union must therefore be effected for us by a supreme power, not our own, in the 'intelligible world' which disposes the course of events so that, if we could see the whole infinite series at once, we should see that every man is happy in proportion to the degree in which he deserves to be happy. Further, since morality demands not merely that the virtuous shall be happy but that the happiness shall be a consequence of their virtue, we could not regard the union of virtue and happiness as effected by a mere blind 'natural tendency' in things. The virtuous man's virtue must be the motive of the disposing power to make him happy—*i.e.*, this disposing power must be thought of as an intelligent and absolutely holy *will*. Thus it becomes a postulate of morality that there is an absolutely wise and holy Supreme Being. We have already seen that the speculative use of reason in finding an explanation for natural events themselves suggested the hypothesis that there is a Supreme Being, though all our attempts to demonstrate the truth of this hypothesis proved to rest on fallacy. The consideration of the presuppositions of morality now shows us that, unless there is to be a hopeless conflict between our conception of the highest good and the first principle of duty, such a Supreme Being must really exist and, what is more, must be spiritual. Practical reason then does not introduce us to any new idea; if it did, there might be an insoluble conflict between its suggestions and the results of speculative criticism. It only gives us the right to affirm as a reality what speculative reason itself unavoidably suggests as a possibility, the complete dependence of the world on a Supreme Being, and enables us to determine the character of that Being so far as to say that it combines perfect wisdom, holiness, and power. Beyond this moral theology cannot go. It tells us what God must be if the world is to have moral order, and it tells us nothing more. Kant pushes this consideration so far that he is not content to say with the Neo-Platonists and scholastics that we do not know God *secundum essentiam suam*. Recurring to his view that an object of possible experience must have sensuous constituents (must be given in intuition), he in effect denies that we have any experience of God at all. 'Mystics' profess to experience the divine, but for that very reason Kant sets them down summarily as 'fanatics' who must not be allowed a hearing.

[1] That the *Critique of Practical Reason* should be divided, like the *Critique of Pure Reason*, into an 'Analytic' and a 'Dialectic'—of course there can be no 'Aesthetic' in this case—and that the 'Dialectic' must have its antinomy is a pure piece of pedantic formalism which Kant would have done well to dispense with.

[2] The words of this statement are not precisely those of Kant, but have been chosen to express as briefly and untechnically as possible the substance of his thought. It should be carefully observed that the central thought is not egoistic. Kant's point is that the 'ideal spectator,' apart from any consideration of his own happiness, would judge unfavourably of a world in which the will of the truly virtuous man was constantly thwarted by the 'force of circumstances.' My own happiness, as he is careful to state, only comes into the consideration in so far as I am one among the many rational and responsible beings in the universe. Nor is happiness understood in a merely hedonistic way. It is the condition in which things happen 'according to our will'—*i.e.* in which the rational will is really effectual.

[3] In fact, though Kant would have been horrified by so 'fanatical' a phrase, he is at bottom quite agreed with 'Dionysius' that 'deification' (θέωσις) is the ultimate goal of the moral life.

The value of Kant's moral argument for theism seems quite independent of our judgment of the critical philosophy as a whole. The phenomenalism which is the weakest point of the system only affects Kant's unfavourable estimate of specific religious experience. It might, indeed, be said with an appearance of plausibility that God as the source of the subordination of nature to the moral order is only brought in to solve a difficulty which Kant has created for himself by the abstract formalism of his ethics. No Kantian doctrine has come in for more unsparing reprobation than the famous theory that the moral worth of an act depends upon its being done from mere reverence for universal law as such, and is destroyed if any desire for a specific result influences the agent's motives. But, apart from this untenable theory, it may be said, there is really no antithesis between the supreme object of virtuous willing and its true principle; the realization of the good is at once object and principle. And thus the problem which, according to Kant, is solved for us by the existence of God is not a real problem at all. Yet such criticism surely misses the mark. The problem Kant has in mind still remains when the pure formalism of his own conception of the good will has been dismissed. One and the same conviction of the absoluteness of moral values, the right of δικαιοσύνη to control the world, compels us to pronounce the world evil and our own moral striving a vain show if the highest good is not realized or realizable, and also forbids us to aim directly at the realization of this highest good by doing moral evil that good may come out of it or leaving the right undone because the consequences of doing right are judged by us to be, in a certain case, bad. It is certain that good often comes out of moral evil, and that moral integrity itself often demands action which leads to bad results which would not have followed if the agent had been less virtuous.[1] Thus, quite independently of any special Kantian theses in ethics, we are confronted by the dilemma: either the order of things, rightly understood (the intelligible world), is a moral order and realizes the highest good or the highest good is not realized and all moral effort is senseless and foredoomed to failure, in which case the conviction of the absolute value of the good, on which morality is based, is a mere illusion. If this be so, the argument from the reality of absolute moral values to the all-wise, all-holy, and all-powerful Supreme Being, in the present writer's judgment, holds, exactly on the lines on which Kant has conducted it. It is precisely the same argument, divested of its incidental trappings of Kantian 'critical' phraseology, which Solovyof compresses into a sentence when he writes:

'The unconditional principle of morality, logically involved in religious experience, contains the complete good (or the right relation of all to everything) not merely as a demand or an idea, but as an actual power that can fulfil this demand and create the perfect moral order or Kingdom of God in which the absolute significance of every being is realized.'[2]

16. Lotze.—This article cannot undertake to follow the history of the treatment of theism in philosophy beyond Kant with any detail. To do so would require a substantial volume, and it does not seem to the present writer that anything which is new in principle has been added to the arguments for or against theism since Kant's development of the moral proof in the *Critique of Practical Reason*. An exception, however, may be made for Lotze, more particularly on the ground that he has done so much, in the face of Kant's critical repudiation of his own earlier position, to vindicate the speculative argument upon which Kant himself relied until advanced middle age.[1]

It may seem strange to describe Lotze as reasserting the particular version of the cosmological argument which finds in God the necessary actual ground of possibilities, in view of the fact that Lotze himself, in the chapter on the 'Proofs of the Existence of God' in the *Grundzüge der Religionsphilosophie*, professes to have disposed of the cosmological proof in one or two paragraphs of not very profound criticism. Yet an analysis of his own argument will show that, though it is not quite identical with any former statement of the cosmological proof, it really follows the general lines of Kant's pre-critical argument for the 'being which exists with an absolute necessity.' The starting-point of Lotze's train of thought was historically determined for him by the necessity of taking up a definite attitude towards the philosophy of Herbart, and to a lesser degree of Hegel; this special concern with the problems raised in the metaphysics of Herbart further accounts for the very marked influence of Leibniz.[2]

Lotze starts with the fact of incessant change or becoming as the most obvious characteristic of the empirical world. The great problem of the metaphysician is to give an intelligible account of the pre-conditions of this universal fact of change.[3] We can neither dismiss change or becoming as a mere illusion (since, even if you deny all change in the objective world, the illusion itself has to be regarded as a process of change in the inner states of the existents which we call minds or souls) nor resolve the history of the universe into a process of absolute becoming, a wholly lawless succession of disconnected states. This would be fatal to the possibility of all knowledge whatever. Change or becoming, then, is real, and it is always grounded change. This is shown by our success in formulating laws of natural processes. If we find that A is regularly, though not always, followed by B, we must suppose that there is a reason in the state of things in which A was present why A should be replaced by B rather than by P or Q, and, if on special occasions A (which is commonly followed by B) is followed by P, there must again be a reason why it is, on these occasions, followed not by the usual B but by the unusual P. At the stage of reflexion reached in natural science we attempt to do justice to this demand for an intelligible interpretation of change by the view that the world is made up of a plurality of different 'things' ($A, B, C \ldots$), each exhibiting a succession of 'states' ($a_1, a_2, a_3 \ldots b_1, b_2, b_3 \ldots c_1, c_2, c_3 \ldots$). We then say that the changes of state of the various things are interconnected by laws according to which a definite change of 'state' in one thing (*e.g.*, the occurrence of a state a in A) gives rise to the corresponding change in another (the occurrence of a state b in B). This interpretation of the facts, Lotze urges, cannot be final. If the universe were really a collection of independent existents, or 'things,' how could the occurrence of a change of state in one of these existents be conditioned by changes of state in the rest? The very fact that, *e.g.*, A only exhibits the change from state a_1 to state a_2 on the condition that certain definite changes occur in a number of other 'things'—in a word, the 'interconnexion of things in obedience to determinate laws'—shows that the universe is not an ultimate plurality. We are bound to think of it as *one* being of which what we commonly call the various 'things' are partial expressions or activities. We must amend the statement that the changes of state in a plurality of things are related according to definite formulae into the statement that the one and only real 'thing' has a determinate nature or character of its own which it maintains unimpaired. It is this self-maintenance of the 'living whole'—M, as Lotze symbolically calls it—that requires that the change of which we speak as occurring in the thing A should be compensated in a definite way by connected changes, which we are accustomed to refer to the other things $B, C \ldots$. Strictly speaking, then, every change in any element of M is correlated with changes in all the rest. But some of these changes may be minimal and so escape our notice. Hence we are able for our human purposes to formulate laws which connect a definite change in one element with definite changes in a finite number of others, B, C, D, and treat all the rest of the elements as a remainder R, which is irrelevant. The world, then, is not a plurality but a unity-in-plurality. How the unity is effected is more than we can ever expect to know. We may say, 'The unity is the plurality,' but we must remember that the 'is' here is a copula of which the concrete modality

[1] See the entertaining illustrations of this point in V. Solovyof, *The Justification of the Good*, Eng. tr., London, 1918, pt. iii. ch. 6.

[2] *Ib.* p. 180. The whole of Solovyof's book is worth reading as a corrective to Kant's thesis that philosophical theology is exhausted by the one proposition that God exists.

[1] Lotze's treatment of the subject is to be found partly in his *Metaphysik*, latest ed. Leipzig, 1912, Eng. tr.[2], 2 vols., Oxford, 1887; see particularly bk. i. chs. 6–7, with which may be compared the more condensed *Grundzüge der Metaphysik*, Leipzig, 1883, Eng. tr., *Outlines of Metaphysics*, Boston, U.S.A., 1886, particularly the chapter 'Of Causes and Effects' (Eng. tr., pp. 57–73), partly in the *Grundzüge der Religionsphilosophie*[3], Leipzig, 1894. A longer and more popularly written exposition is given in *Mikrokosmus*[6], 3 vols., do. 1896–1909, Eng. tr.[4], Edinburgh, 1894, bk. ix., 'The Unity of Things.' Only the general outline of Lotze's doctrine can be dealt with here.

[2] It must be remembered that Lotze was necessarily unacquainted with Leibniz's most important papers, which were mostly unpublished until after Lotze had arrived at his own fundamental doctrines; hence his version of the earlier philosopher's thought is not to be implicitly trusted.

[3] This was precisely the problem which had specially occupied Herbart and the Herbartians.

is not fully known to us. But it is important to be quite clear on one point of the first importance. The one 'living whole' M is not properly described as 'subject to universal laws.' If we think of the world as composed of things subject to general laws, it is quite impossible to give any ultimately intelligible account of the relation between the things and the laws. The absolute *prius* is not a complex of laws, but the concrete M and its individual acts of self-expression and self-maintenance. Since we are part of the contents of M, we can compare facts with facts, recognize likeness and differences, and so come to formulate general propositions. We can even carry this so far as, when we have formed the notions of 'class' and 'member of a class,' to think of M, the real world itself, as one member of a class of worlds, and to speculate on the possibility that there might be others—'possible' worlds, as Leibniz said. Then we may be led, as Leibniz was, into the insoluble problem why just this world M, and not a different one N, is real. But this whole way of thinking of possibilities as metaphysically anterior to reality, or of the hypothetical propositions we call laws as anterior to the individual facts we call the actualized cases of these laws, rests on illusion. Metaphysically speaking, it is the actual nature of M that accounts for our existence and our possession of the mental capacities which we exercise in framing laws and hypotheses. If M were other than it is, its elements would be different, and, if we were among these elements, our views as to what alternatives are possible would be different also. It is a radical error in philosophy to confound logical with metaphysical priority.[1]

How M can be the ἓν καὶ πολλά required by the theory we cannot say in detail. But we can see, at any rate, that M cannot be material. The only thing with which we are acquainted which, even imperfectly, discharges for a part of reality the functions which M must discharge for the totality is the soul which at once has or owns a multiplicity of states or activities and would have no life without them, and is yet aware of its own unity and its distinction from each and all of these states and activities. We are thus driven to think of M in terms of spirit. It must be akin to the soul, but must, at the same time, have all the differences from our souls which result from the consideration that it has nothing outside it, is wholly unique, and can meet with no resistance. We are thus led to think of M as an infinite spiritual and, Lotze adds, personal being, allwise (because its knowledge has not to develop under difficulties and from point to point, like our own), almighty (because it is the absolute *prius*, anterior to all 'law' as well as to all fact), and, above all, all-good (Lotze weakens his case on this point by a half-hearted tendency to take a hedonist view of good, and so to reduce perfect goodness to mere 'benevolence'; a Platonist would have no difficulty, since the all-wise must have complete knowledge of the good, and to know the good is to act it out). M is also 'out of space' and 'eternal,' since geometrical and temporal relations are, and are what they are, as a consequence of M's existing and being what it is. Thus the conception of M with which we began as 'the one real being' passes into the conception of the almighty and eternal God, and the close of our historical retrospect brings us back very close to the position of Neo-Platonism again. It calls for remark that, though Lotze's initial account of M, taken by itself, would suggest a pantheistic or immanence theory, the doctrine, as fully worked out, is definitely theistic. Lotze is careful to guard himself, even when he says that M *is* the world, by adding that 'is' here has a unique sense which it has in no other judgment, and is consequently not the 'is' which occurs in an ordinary identity. Later on we find that each soul, being aware of its own unity, is a real individual distinct from God and from every other soul, though it is from the creating and sustaining activity of God that the soul derives this character. And mere inanimate things are held to be a superfluous hypothesis. There are, according to Lotze, only the one living God and His acts. Some of these acts are souls with a real spiritual individuality of their own. In this way, while avoiding the customary theistic language about the transcendence of God, Lotze secures the same result by maintaining not that God is immanent in the world, but that the world is 'immanent in God.' The limitation of real individuality to souls naturally reminds us of the Neo-Platonic view that souls hold the lowest place in the system of ὄντα, bodies being not ὄντα but γιγνόμενα, 'what becomes,' or εἰκόνες τῶν ὄντων, 'images of ὄντα.' The resemblance with Neo-Platonism is even more marked when Lotze uses his view of M as the metaphysical *prius* of universal laws or eternal truths as a ground for urging that life, truth, and goodness are not, as the Aristotelian phrase has it, 'naturally prior' to God; God is Himself the concrete Life, Truth, and Good.

17. Logical pluralism.—The foregoing statement of the theistic argument as presented by Lotze provides an opportunity for considering the type of ultimate pluralism of which we have spoken as the most serious philosophical alternative to theism. This type of view is best represented in contemporary English philosophy by the writings of G. E. Moore and Bertrand Russell, though, as neither of these authors has ever directly attempted the construction of a metaphysical system, we must be content to indicate the general view to which their studies in logic, ethics, and the philosophy of the exact sciences seem to point. A pluralism of the type in question would take issue with Lotze over the validity of the ground on which he maintains the existence of such a being as M. It would insist on precisely that form of 'dualism' which Lotze assumes to be unthinkable—the 'dualism' of actual existence and hypothetical universal laws. It would be maintained that what we actually find the 'world' to consist of is a plurality of existing things standing in a complicated network of relations of all kinds with one another. These relations, it would be further said, cannot all be reduced, as Lotze assumes, to reciprocal causal inter-connexions. Causal connexion is only one of the many types of relation; there are others, such, *e.g.*, as the mere 'togetherness' or 'compresence' which language represents by the word 'and,' the 'disjunction' symbolized by 'or else,' and so forth, in which causality is not a component at all. Relations are all 'universals,' and no relation is an 'existent,' while 'existents' are all individual. We have to accept it as an ultimate fact which permits of no explanation that specific individual existents stand in certain definite relations to other specific individual existents. To ask why this is so is to ask a question quite as illegitimate as that which Lotze ascribes to the purely mechanical philosophers whom he ridicules for asking 'how being is made.' More particularly, the special problem which leads Lotze to frame the concept of M—the problem how a change of 'state' is brought about, how one thing can exhibit a succession of different states or first have a relation to a second thing and then lose it—would be declared illegitimate. According to the view which has been most elaborately developed by Bertrand Russell,[1] the proposition that at a certain moment A changes its state from a_1 to a_2, or changes its relation to B from R_1 to R_2, if expressed accurately, only means that the whole duration of A's existence can be resolved into two mutually exclusive classes of moments. In any moment of the one class A has the state a_1, or stands to B in the relation R_1; at any moment of the other class A has the state a_2, or stands to B in the relation R_2. And, further, every moment of the one class a_1 comes before any moment of the other class a_2. There is no moment in the whole conjoint class a_1+a_2 at which A has both states or both relations, and no moment at which it has neither. Thus, strictly speaking, there is no such process as that which Lotze calls change, and we live, in fact, 'in a changeless world.' Fully thought out, this view leads to the position, adopted of recent years by Russell, that all existents really exist only at a mathematical instant. What we commonly call one and the same thing or one and the same mind is an infinite succession of different things or minds which we mistakenly regard as one, because the thing or mind which exists at a moment m_2 separated by a minute interval from a preceding moment m_1 is very much like its predecessor. Thus Lotze's argument is invalidated by denying the reality of the facts it is employed to make intelligible. As there are no changes, in the sense in which Lotze understands the word, there is no ground to assert the existence of M to account for them. All arguments for the reality of a 'being which necessarily exists' are thus invalidated; and it is, further, at least highly doubtful whether we can even form the thought of

[1] It will be clear from these last sentences why the present writer regards Lotze's argument for the unity-in-multitude of M as in principle identical with Kant's pre-critical argument for a 'necessary existent' as the foundation of real possibility.

[1] In *The Principles of Mathematics*, Cambridge, 1903. The later work of Russell and Whitehead, *Principia Mathematica*, Cambridge, 1910 and subsequent years, does not assume this metaphysic.

a 'being which cannot be conceived not to exist.' Causality, as commonly understood by metaphysicians, likewise disappears. The causal principle reduces to the modest proposition that an observed frequent sequence of an event of the class β on an event of the class α affords ground for the judgment that in cases not previously observed an event of class β is likely to have been preceded by an event of class α. How likely this conclusion is is then a mere problem in the mathematical theory of probability. Whether all events have causes or not remains an open question, and must always remain so. It is clear that such a theory leaves no room for theism in philosophy. If it is really the last word of metaphysics, belief in God loses all rational foundation, though it is, to be sure, still possible that the belief may 'happen' to be true. It must further be admitted that the theory has its strong points. It is by no means obvious that a philosopher is entitled to assume as axiomatic such a conviction about the thoroughgoing interconnexion of all events as Lotze makes the basis of his argument. In what sense or to what degree the 'world' is a unity is a question to which philosophy must find the answer. The interconnexion might conceivably be very much looser than Lotze is willing to admit. And it seems clear that the mathematical analysis by which the particular puzzle about change is eliminated is, *as far as it goes*, entirely justified.[1] Nor yet can it be denied that the very modest statement to which the principle of causality is reduced is all that is required at any rate for the purposes of natural science.

It still, however, remains a question whether we could possibly be content with a logical pluralism of the kind just described as the final answer to our intellectual demand for a rational explanation of the world. For the purposes of the present article it must be enough to call attention to a few of the considerations which suggest that such a theory can only be provisional. One may fairly doubt whether it can really be called an explanation or interpretation at all. The system of interrelated existents with which it presents us as the solution of a perennial intellectual problem seems to be simply the problem itself stated in an unusually abstract way. And it ought to be clear that, when it has been granted to the full that the special problem about the meaning of change has been eliminated, there is a more fundamental problem which the theory has simply left out of account. However true it may be that 'we live in a changeless world'—*i.e.*, that there never is a 'moment' in which anything is 'passing from one state to another'[2]—Lotze's main contention, that the analysis of the universe into relations and existents, which are the terms of the relations, rests on the uncriticized assumption that the successive steps of the logical construction by which we try to make things intelligible correspond exactly to the steps of the real process by which 'being,' so to say, constructs itself, has been left unanswered. Logical pluralism, no less than the 'panologism' of Hegel, simply assumes that the logically prior and the metaphysically prior are identical. The only difference is that the logic of Hegel is so much inferior as logic. To put the point in the simplest possible way, we cannot avoid raising the question why, out of the infinity of relations open to the study of the logician, some and only some are actualized—have existents as their terms. Logical pluralism has no answer to this inevitable question except that 'it happens to be so.' And this is really no answer at all. It amounts to saying not merely that the world might have been wholly different from what it is, but that there might equally well be no actual existents whatsoever. The theory fails to satisfy us for the same sort of reason as that which prevents the ontological proof from producing conviction. Just as that argument assumes that 'there must be something,' so the theory we are now considering assumes that 'there might just as well be nothing.' Now, we cannot prove that there must be something, nor can we prove that there might have been nothing; we have to start from the fact that there is something and that this something has a definite character. Hence, to the present writer, Lotze seems right in contending that it is the character of this something that accounts for the range of logical possibilities itself being what it is, and Kant in arguing that there is an actual ground presupposed by the very distinction between the possible and the impossible. In fact the logical pluralists themselves seem to admit as much when they rightly insist that the so-called laws of thought are laws not of thinking but of things. It is therefore by a rightful exigence of the intellect itself that we are driven to conceive of the structure of the world as explicable only by the metaphysically 'first' character of the 'necessary being'; and, when once we have taken this step, it is not hard to show that the 'necessary being' must have the character of the *ens realissimum*. It must be its own justification, its own *raison d'être*. If so much be granted, it follows at once that, though we can form no adequate positive concept of such a Supreme Being, the least inadequate way in which to think of it is in terms of the highest values known to us—*i.e.* by analogy with the human spirit at its best. How inadequate such an analogy is has always been patent. Even of the human spirit at its best we can only form very inadequate notions from what we see of its actual achievements, and our notion of the Supreme Reality which is the source of our estimates of worth, as of all other possibilities, must needs be doubly imperfect when it has to be framed in so unsatisfactory a way. But we can at least say that such a being must be all that we mean when we think of perfection in ourselves, and infinitely more. If we are not satisfied with theories which, under a disguise, offer us the unexplained detail of the world as its own explanation, it is only in the thought of the detail as throughout conditioned by the living Good that the intellect itself can finally acquiesce. Of course we cannot expect to know in particular how each constituent of this detail is consequent on the character of the Good—why, *e.g.*, it is 'best' for us in particular to be living on the particular planet on which we do live, rather than any other; why there should be just the number of members of our planetary system there are; why the range of colours we can perceive should be neither more nor less extended than it is; and the like. But the conviction that all this detail is as it is 'because it is best' gives an adequate reason why it is what it is, even though we may be quite unable to see why it is best.[1] And it is only the thought of the dependence of the world on the absolute Good which, by removing the artificial severance between the realm of fact and the realm of values, can achieve

[1] The question is *how* far does it go? Is an 'instant' more than a mathematical 'limit'? The 'Theory of Relativity' becomes important at this point (consult A. N. Whitehead, *Enquiry into the Principles of Natural Knowledge*, Cambridge, 1919).

[2] Yet it is surely true, as maintained, *e.g.*, by Whitehead, that 'passage' is just the fundamental fact about Nature, however we choose to analyse it. 'Nature' is, as Plato called it, a γιγνόμενον.

[1] It would be a superficial objection to say that 'because it is worst' would be also an answer to our question. Good (no one has done more to insist on the point than Moore) means something definite and positive. So 'best' has a meaning, but 'worst' has none, any more than 'so crooked that nothing can be crookeder' has.

the solution of the supreme intellectual problem, the reconciliation of science with life.

These considerations suggest certain further reflexions on the limitations of logical pluralism. The whole theory has manifestly been thought out in the exclusive interest of pure mathematics and the application of mathematics in the natural sciences, and for that purpose it works admirably. But there is more in heaven and earth than these sciences take into account. Even within their limits it remains to be seen whether the theory as it stands will really do all that a philosophy of the sciences should. The fundamental difficulty is that it is a consequence of the theory that, as has already been said, the establishment of scientific laws by induction comes to be simply a problem in the theory of probabilities. But the theory of probabilities, taken by itself, seems to give us no ground whatever for attributing to the conclusion of an inductive generalization any finite probability, however small.[1] Science would thus seem to be impossible in principle unless some as yet undiscovered premiss for induction, which is not included in the theory of probabilities, can be unearthed; and it remains to be seen whether such a premiss, if discovered, is consistent with the rest of the theory. Again, the replacing of the individual existents of popular common sense and ordinary science by infinite series of momentary individuals seems an absolutely necessary consequence of the initial assumption of the theory, and, so far as the things of the external world as conceived by common sense, or the constituents of the physical order as conceived by the physicist, are concerned, there might be no difficulty about it.[2] But it is quite another question whether the substitution does not destroy the whole significance of the moral realm, the system of intelligent spirits. It is not merely that it creates a difficulty in psychology, though surely it does create such a difficulty. The immediate witness of consciousness to our identity as subjects of experience is a real fact which no logical theory about the constitution of the world has a right to ignore. It may be that 'the mind thinks not always,' that there are intervals in which each of us is wholly unconscious, though such evidence as we have does not seem favourable to the supposition; but, at least when we are conscious, every conscious act fills an actual interval and yet has its absolutely unitary character. A 'duration,' though a brief one, is necessary to think the simplest proposition, and much more to draw the easiest inference. Yet the thinking of the proposition or the making of the inference is a unitary act only intelligible as the act of a unitary intelligence. It is nonsensical to say that, when I think 'God is,' this thought, as a mental event, is really made up of an infinity of momentary 'mental states' of similar but numerically different minds, or that the 'I' which resolves on a given act and the 'I' which carries out the resolve are each an infinity of different 'I's' with a further infinity of still different 'I's' between them. Only the elementary blunder in analysis of resolving activity into mere succession can account for the promulgation of such a view. It is a still more serious matter that the doctrine is wholly incompatible with the fundamental prerequisites of ethics. This point is capable of being developed in great detail and from more than one side, but in principle it should be enough to say that the denial of permanent personality is fatal to the conception of personality as having moral worth. If we analyse any act upon which a moral judgment would normally be passed into an infinity of momentary phases, no moral predicate can be ascribed to any one of these stages. The moral judgment for approval or condemnation has no meaning if it be applied to any such single stage; to be significant, it must be passed on the whole act, considered as one, and as an expression in act of the inner will of a subject who is one and the same from its first inception in thought to its completion. Similarly the notion of duty loses all its meaning with the relegation of permanent selfhood to the realm of illusion. That an act is my duty in the present situation means that it is something not yet done, but which ought to be done and to be done by me. But if 'I' only exist at a mathematical *punctum temporis*, the proposition that I ought now to do a certain act has no longer an intelligible significance. A merely momentary 'I' can do nothing and can be nothing except just what it is; 'ought' is a category which has no application to it. It is no mere accident that Russell should have dropped significant hints in his latest writings of conversion to the view that moral judgments are only 'subjective,' mere expressions of fundamentally irrational moods. The real outcome of a logical pluralism, put forward as the ultimate truth about what is, is not even that standing dualism of what is and what ought to be of which Lotze complains; it is rather the pronouncement that categories of value (there can be no reason to confine the conclusion to specifically ethical values) are one and all devoid of any real application. For those who cannot accept this result, Kant's moral argument for theism seems to the present writer unanswerable. For it is only if the Good is also the supreme principle of all existence that it becomes possible to understand how what is and what ought to be can form one 'world,' and from the recognition of the Good as the Supreme Being theism follows directly. This seems to be illustrated by the present state of philosophical opinion in our own country. Throughout the thirty years or so, from the seventies of the last century onward, in which Hegelianism, interpreted with a marked Spinozistic bias, was the dominant philosophy in academic circles, there was a natural tendency to make it almost the test of a man's philosophical capacity that his attitude towards the problems raised by the religious life should be an emotional pantheism; atheism was in discredit as indicative (as indeed it is) of lack of interest in or understanding of the whole realm of personal values; theism as a supposed mark of want of logical thoroughness. In the present generation the issues seem to be clearing. Philosophers are certainly tending, though not without exception, to range themselves into two camps. Those to whom the business of philosophy seems to consist mainly, if not exclusively, in providing a logical basis and a methodology for exact science appear to be identifying themselves with the doctrine of logical pluralism and taking up a definitely atheistic attitude which involves the denial of the objectivity of judgments of value; those, on the other hand, who are convinced that the business of philosophy is to make life, as well as science, intelligible, and consequently find themselves obliged to maintain the validity of these categories of worth apart from which life would have no significance, are, in the main, declared theists.

18. Objections to theism.—It may be desirable to add some brief observations on certain types of objections which are often quite sincerely raised against a theistic interpretation of the world. In principle none of these difficulties are novel; most of them find their expression in Hume and may be traced back far behind Hume to the literature of

[1] See the acute discussion by C. D. Broad, in *Mind*, new ser., cviii. 389–404, and the criticisms of P. E. B. Jourdain, *Mind*, new ser., cx. 162–180. Jourdain's criticisms do not seem to the present writer to affect the soundness of Broad's contentions.

[2] But the philosophical interpreters of the 'Theory of Relativity' would have something to say on this point.

the ancient world. Popularly these objections are often called 'scientific,' though their only connexion with modern natural science is that its discoveries enable some of them to be stated in a more impressive way. For the most part they are all summed up in the antitheological assertion of Lucretius that the existing world is too bad to have been created or to be administered by a divine intelligence, 'tanta stat praedita culpa.' Thus it is urged that the suffering of the animal creation is too great, the cost of the 'struggle for existence' too painful, for us to ascribe a world like that we know to a benevolent Creator. Or, again, it is said that an almighty Creator might have made the human race, in particular, such that it would not be exposed as it is to suffering, to constant struggle with its environment, to the consequences of its own mistakes and wrongdoing. It is then inferred that, if there is a superhuman intelligence behind nature, that intelligence is either deficient in wisdom or wanting in goodness. Now, obviously, criticisms of this kind rest upon premisses which may be fairly called in question. One might reasonably doubt whether the pessimistic interpretation of the facts which sees misery predominant everywhere in animal and human life has any real warrant. To an unbiased observer an animal does not seem normally to give signs that it finds its existence miserable, and it is notable that suicide is not common among men, and, unless the stories of the scorpions which kill themselves when surrounded by fire are true, apparently as good as non-existent among the lower animals. The misuse of the metaphorical phrase which describes the process by which species are selected for survival as a 'struggle' is too glaring to need more than a word of comment. If competition plays a prominent part in the economy of the animal and vegetable kingdoms, as it does in the economy of commerce, it no more follows that the life of every animal, or most animals (and? vegetables), is one of wretchedness than it follows that all or most business men are hopelessly miserable.[1] Still, of course, it may be said that there is, at any rate, some suffering in the world and that perfect goodness would have permitted none at all. Such an argument, however, tacitly assumes that perfect goodness can have only one end, a hedonistic one, and thus permits of the answer that whatever the end which perfect goodness conjoined with omnipotence would propose to itself—and we clearly are not in a position to say what that end would be—it is at least unreasonable to suppose that it can be the mere promotion of agreeable feeling, an end which even we ourselves regard as a low one. If we could know the purpose of creation, it might well be that we should see that it is entirely good and at the same time could not be attained without the presence of an element of hedonic evil in things. Similarly, with respect to the objection based on the view that it would be 'better' that human beings should have been placed in a world where there were no unfriendly or intractable environment to master, and should have been *ab initio* infallible and impeccable, it is obvious that it loses its force if we decline to assume (1) the hedonistic identification of good with pleasure, and (2) the proposition that the good of the human race must be the sole or at least the principal design of God. If God's aim in dealing with us is to educate us into noble character—a much worthier aim than that of making us comfortable—it may well be that such an end could not be obtained except by the discipline of struggle with our surroundings, with our own mistakes and our own misdeeds.

[1] And is it possible, in the present state of knowledge, to regard 'competition' as playing anything like the part Darwin assigned to it in determining the fate of 'varieties'?

Nor have we the right to assume that the human race must necessarily be the sole or even the chief object of the divine care; we do know, unless ethics is a delusion, that a human soul is a thing of absolute worth; that it is of higher worth than everything else which God has created is more than we can know. Indeed there is a rival objection which proceeds on the opposite assumption. We are asked to think of the enormous spaces revealed to us by astronomy and the number and bulk of the heavenly bodies, and then to reflect on the absurdity of supposing that the fate of the inhabitants of one petty planet can count for anything in the scheme of the universe. Yet it is clear that here, too, the antitheist is reasoning (if it can be called reasoning) upon a false assumption. He is assuming that we know that the absolute worth of a member of the universe is estimated by its bulk and duration. Man must be of little value in the scheme of things because his body is tiny and its lifetime short. Plainly we have no right to make serious objections to the theist's belief in God's care for man on such flimsy grounds. If we do not know that man is the thing of highest worth in the creation, neither do we know that he is not. The one thing which a theist can affirm is that the absolute worth of moral personality must be respected in a system which is the work of God. 'Justorum animae in manu Dei sunt'; that is all we can say, but surely it suffices. If the Good is the principle of actuality, that means that we can say that a thing has come to be because it was better that it should be than that it should not; it is where and when it is because this is better than that it should be otherwhere and otherwhen; that befalls it which does befall it because it is best that it should befall—*i.e.*, God is alike Creator, Providence, and Judge of His creatures. Of course, if we had no grounds at all for our theistic conviction, difficulties like those mentioned might forbid us to entertain it as a mere 'extra' belief. But, if it is true, as has been urged in this article, that speculation and practice alike point to the eternal nature of God as the object in which both find their completion, we have a double exigence of the practical and the speculative reason on the side of theism, and in the presence of such an exigence we are justified in applying Newman's remark that 'a thousand difficulties do not amount to one doubt.' One might add that there is a third exigence—the specifically religious. It would be perhaps a more serious objection to theism than any we have yet considered to urge that our whole procedure in looking for a First Cause is vitiated by one obvious fallacy. The world, it might be said, even if it has attained its present structure as the result of processes which are in the last resort reducible to mere redistributions of unintelligent primary constituents, directed by no mind and having no end, still must, of course, have a perfectly determinate structure, and, as we ourselves happen to be included in that structure, of course we inevitably discover adaptations in our environment to our special needs, and are led to fancy that such adaptations are evidence of the direction of the world by an intelligence which aims at supplying our needs. But the real fact is simply that it is not the world that has been adapted to us, but we who have learned and are learning to adapt ourselves to the world. If we did not so adapt ourselves, we should not be here, and, if a time ever comes when our capacity for such 'adjustment' of our 'inner relations' to the 'outer relations' is exhausted, we shall cease to be here. If the actual course of events had been different, all the reactions which we now call good, because they further adaptation, might have hindered it, and those which now hinder it might

have furthered it. If in such a state of things there had been reflecting beings at all, they, judging from their standpoint, would have called good all that we think evil, and evil all that we think good. They would have inferred benevolent divine activity from the existence of conditions which we should regard as indicating the control of nature by malignant 'diabolical' intelligences; and their inferences would have just as much foundation as ours. These considerations, it might be said, are a *reductio ad absurdum* not merely of all attempts to reason from 'Nature up to Nature's God,' but of the moral argument itself, since they show after all that standards of valuation are and must be in the end purely subjective. Since the human race exists, and so long as it continues to maintain itself, there must, of course, be no irresoluble discord between human estimates of value and the actual conditions of existence. But, as the illustration shows, we have no right whatever to argue from this simple and obvious fact to the dependence of existence on an absolute 'Good.' In fact, any of the races which have 'gone under' in the struggle for existence would be equally justified in asserting that existence depends on the absolute 'Evil.' Here, as it seems to the present writer, we are confronted by the real ultimate difficulty for theism. If there is, after all, no realm of absolute values, a line of thought which is throughout determined by the conviction that the realm of facts and the realm of values cannot be separated must manifestly be futile. It is just the recurrent fear that the 'realm of values' may turn out to be a fiction of our imagination that is, in speculation, the last enemy to be overcome. How is it to be met? The answer, it may be suggested, is the old one, given in the memorable utterance of Pascal: 'Tu ne me chercherais pas si tu ne me possédais. Ne t'inquiète donc pas.'[1] The sentences may be applied to ultimate doubt about the reality of every kind of human value. Is a man tempted to doubt whether there really is any absolute and certain truth, whether all our 'truths' may not be mere 'human' or even 'personal' points of view, *βροτῶν δόξαι αἷς οὐκ ἔνι πίστις ἀληθής*? Let him bethink himself that it is only because he is not unacquainted with truths that he can frame the notion of the absolutely true, and only because he has framed the notion that he can raise his doubt. So it is only because we are all along secretly aware that there are things which we ought unconditionally to do that the question whether any given accepted obligation is really unconditional can so much as be put. If we knew no beauty, we could not even ask ourselves whether our judgments about beauty rest on illusion. In like manner it is only because the absolutely Good and utterly Adorable has not left Himself without a witness in our hearts that we feel the need of an object to worship and are driven on from the worship of trees, or streams, or animals, or mighty men, or anthropomorphic deities, towards an object in which our adoration can at last find rest because that on which it is directed is adequate to sustain it. Prayer and adoration need no more justification than the questioning attitude towards things which leads to science, or the impulse to make things of beauty which leads to art, or the desire to do right which leads to morality. It is not for nothing that man, as the Greeks said, is the only animal who has a god. If we look at the matter from this point of view, we may fairly say that the Stoic appeal to the *consensus gentium*, though no formal demonstration, still contains a thought which goes to the very root of things. There are, of course, individual men who do not feel the impulse to seek for Him whom they may worship with a *rationabile obsequium*, as there are men with no sense of humour, or men to whom music means nothing, or men who cannot be made to see that the difference between right and wrong is anything more than the difference between what society will allow them to do and what it will not let them do without making them uncomfortable. The existence of such individuals is about as important in any one of these cases as in any other. Nor does the number of such men without a religion seem to be on the increase. In our own day the only effect of persuading men that the Most High is a dream appears to be that they transfer their worship to the demonstrably not most high; we get such quaint aberrations as the Comtist worship of 'humanity,' or the elevation of Marxian Socialism into a faith. The one real question is not what certain individuals are unable to feel the necessity of searching for, but what those who do seek find, *sed quid invenientibus?* The lives of the 'saints' are the real answer of theism to the last insistent perplexities of the doubter who lurks in each of us. Others, without the theist's faith, have often led noble lives; they have fought a good fight with the untowardness of a world which they have believed in their hearts to be stupid or malignant; yet the most clear-sighted among them, like Huxley, have confessed that mortal heroism is a losing game, a battle with the cosmic forces. Such heroes, after all, do but apply to the universe the saying of the Emperor Marcus about base men: 'The finest revenge is not to become like them'; they have revenged themselves on the world. What they lack—and one does not see how the lack is to be made good—is the secret of spiritual joy which belongs to those who are assured that it is the Good which is supreme in heaven and in earth. It would be tempting to develop this argument farther, from a slightly different point of view—that of love. To love, no less than to worship, it may be said, is an ultimate human need. At least, if a man does not feel the imperativeness of the need, we should probably say there was something 'inhuman' about him. And love too, like worship, seeks its adequate object — that which, without any yielding to illusion, a man can love with all his heart and mind and strength. Love, with no limitations, if it is clear-sighted, for us at least must be an *amor ascendens*, and, as it has its source in good (for real love is always for what is good, not for what is evil, in its object), so, unless it can at last rest in the supreme Good, which is good altogether, it must remain unsatisfied. But we cannot here pursue the point farther. Only one thing more will be said in conclusion, and that for the believer in 'science' who scruples at admitting the reality of the Good. Why do we believe in science at all? Why do we, as we must if we have this belief, refuse to entertain the possibility that the 'progress of science' is only bringing us nearer to a point at which the whole construction would be found to culminate in manifest and hopeless contradictions? As a mere logical possibility there seems to be nothing absurd about the suggestion. If we dismiss it, as we do, it is because we believe that knowledge is good, and because in our hearts, whatever we may say with our lips, we believe that the Good is real. Therefore, little as we know of the facts of the world, we work on in confidence that, however drastically the discovery of new facts may compel us to modify our statements of truth and to supersede as provisional results we once thought established for ever, no new fact of the infinity which might be discovered in an endless 'progress' will ever show that 'science' has been a secular nightmare of the race.

A. E. TAYLOR.

THEOCRACY.—The term 'theocracy' was coined by Josephus,[1] upon the analogy of 'aristocracy' and 'democracy,' to denote a certain kind of national polity. Any tribe or state that claims to be governed by a god or gods may be called a 'theocracy.' History has many different types; *e.g.*, the theocratic idea underlies Brāhmanism, Islām, the papacy, and the theory of 'kingship by divine right.' Yet there is probably no historical instance of a 'pure' theocracy. Just as the British constitution to-day, while predominantly democratic, has monarchic elements, so of old time the Hebrew commonwealth, for example, while predominantly theocratic, had democratic elements. Different polities are distinguishable historically, not because a single principle exhausts them, but because some one principle is dominant within them. The idea of government by God was the dominant one in Israelite polity. In this way it was unique, as Josephus claimed, among the polities of his time. It is the leading instance of theocracy for all times. It is the only one discussed here.

Theocracy came to Israel by survival. The earliest form of human society, so far as anthropology has yet discovered, was the clan or kindred-group. This appears to have been world-wide. In religion it was 'henotheistic,' a particular god belonging to a particular clan. He was part of it, as much a part as any human member. His relation to it was too many-sided to be summed up in any one word. In some ways a tribe's god was like a father, in some like a captain, in some like a king, and so on. But, as monarchy developed among the Semitic races, the relation of the god to the tribe came to be chiefly like that of a king. So, among them as well as elsewhere, there arose the early 'henotheistic' type of theocracy. Its best-known examples are Biblical: Chemosh ruled Moab, Milcom ruled Ammon, Jahweh ruled Israel, and so on. Sooner or later, however, this kind of theocracy perished in every settled land except one. The gods of such tribes as Edom and Moab passed away, with the tribal independence, before the attack of Assyria, or Babylon, or Persia. In other lands polytheism supervened on henotheism. There the gods slowly became rather an appendage of the state than its rulers. But in Israel the idea of the sole rule of a single God survived all the vicissitudes of history. It survived by development. Its history is the history of the way in which Hebrew thought about Jahweh's rule evolved to meet the varying challenge of national need. To set this out fully would be to write the whole story of Israel. Here a narrower question is in place: the idea of government by Jahweh being constant in Israel, how did the idea of its *method* evolve?

The study of the method of any kind of polity turns largely on the nature of its organs, for almost all civilized governments rule through organs. This is peculiarly so with theocracies, since it is only in legend that gods speak directly to their peoples. Josephus himself, in the very passage where he coins the word 'theocracy,' speaks, not of Jahweh, but of Moses, as 'our law-giver.' In Israel, as elsewhere, the organs of theocratic government were long associated with sacred shrines. Horeb, Shiloh, and Bethel are instances.[1] The shrine, so to speak, gave the organ authenticity. When doubt or dispute arose about Jahweh's Law, appeal would be made to the guardians of some great shrine.[2] These came to form a priestly class. At the great shrines, too, there soon began to be books of Jahweh's *tōrōth*;[3] here as well there were the few men who could write and read books. Traditionally, at least, the original Law had been given, and its first edicts written, at the shrine of Horeb or Sinai.[4] In later times, no doubt, when a Hebrew visited a shrine to learn Jahweh's will, its authorized exponent, the priest, would not only read the appropriate law, but explain it. Sometimes, again, he would need to extend an old principle to meet a new 'case.' So, little by little, the 'Law of Jahweh' would insensibly grow. For early Israel three things were indissoluble—Jahweh's shrine, Jahweh's book, Jahweh's priest. The three together formed the normal organ of theocracy.

The history of pre-monarchic Israel, however, has traces of two other theocratic organs—the so-called 'judge' and the 'prophet.' Of these a distinctive phrase is used: 'the spirit of the Lord came upon' so-and-so.[5] The phrase has variants,[6] but this is its usual form. It is the earliest explanation of the method of theocracy.[7] There are some hints that the 'judge' was usually connected with a sacred spot.[8] If so, this theocratic organ also cohered with the shrine. There was perhaps a similar connexion at first between the shrine and 'prophesying.'[9] Before the days of Samuel the

[1] *C. Apion.* ii. 16.

[1] The 'Ark of God' was originally a kind of movable shrine.

[2] Cf. Ex 21[6] and parallels; 1 S 2[25] 7[16ff.].

[3] Cf. Jos 24[26], Dt 31[9. 24ff.], 1 S 10[26]. [4] Ex 34[4. 12].

[5] *E.g.*, Jg 11[29], Nu 24[2], 1 S 10[10]. [6] Cf. esp. Jg 6[34].

[7] It is possible that historical study will at length speak of three organs here instead of two, distinguishing the 'judge' from the warrior-'saviour.' For it has been implied above that to judge, in the ordinary sense of the word (cf. 1 S 8[1-5]), was a function of the priest in Israel; and this was not confined to priests (*e.g.*, Jg 4[4ff.], 1 S 4[18] 7[6]). Such 'judges' were thought of as organs of the 'spirit of Jahweh' (cf. Nu 11[17ff.]). One who had 'saved Israel' (cf. Jg 3[31] 6[14] etc.) was also such an organ. Not infrequently a 'saviour' became a judge as well, and later Hebrew writers, used to the constant union of the captain and the judge in the king, treated it as constant in the leaders of early times too (*e.g.*, Jg 2[16 D] 3[9f. D]). Yet there seem to have been judges who were neither priests nor 'saviours' (Jg 10[3] 12[8-15]; cf. 1 S 7[16f.] 8[1]). To 'save Israel,' to judge, to serve at a shrine, were distinct theocratic functions, though two of them might unite in a single man.

[8] Jg 4[5] 8[27], 1 S 2[26] 7[15ff.]. [9] Cf. 1 S 3[20f.] 9[10].

Hebrew 'prophet' was probably hardly more than the wandering saint of other Eastern faiths[1]—a man who lived a separate and so a 'holy' life. In all lands these have frequented shrines, for, even where they have no 'official' connexion with the ritual, temples offer the best opportunities for the alms by which they live. The first band of 'prophets' named in the Hebrew records appears as 'coming down from the high place.'[2] Primitive thought does not readily isolate the different organs of a god's activity.

Scholars differ about the degree in which the religion of pre-monarchic Israel surpassed other tribal faiths, but all allow that within the period of the monarchy Hebraism became unique. In that period all the theocratic organs named above persisted, but in persisting changed. Every other Hebrew shrine was eclipsed by the Temple in Jerusalem, and at length disappeared. So, too, the Temple became at last the depository of the one recognized book of Jahweh's Law.[3] In Jerusalem, again, the priesthood of Israel ultimately concentrated. At crises in the history of the Southern Kingdom the high-priest sometimes played a decisive part,[4] and there is evidence that the Temple had a succession of priest-preachers who surpassed all contemporary priesthoods in the loftiness of their teaching and the purity of their lives.[5] Their permanent memorial is the book of Deuteronomy. It was only at the close of the monarchy that they became utterly corrupt—a fate that also befell the 'sons of the prophets'—and even then Jahweh's great witness, Jeremiah, was born a priest. Of the three other theocratic functions found in the times before the kings, two—leadership in war and judgment in peace—which had previously often united in a single person[6] now permanently blent in the king. While, of course, there were inferior captains and subordinate judges, he was both supreme captain and supreme judge. And he was effectively both. A king, unlike the earlier 'saviour,' held permanent office, and, unlike the earlier judge, had power to enforce his decisions. And he was king by the will of God. He was Jahweh's 'son,' as having His mind and acting under His guidance.[7] He was 'the Lord's anointed.' At times even a wicked king fell back upon Jahweh's help at the pinch of his people's need.[8] It is true that one king after another 'did that which was evil in the sight of the Lord,' and so repudiated the righteous God of Israel, but the ideal of a king who, like David, did the will of Jahweh remained a part of the hope of Israel. Ideally the Hebrew monarchy was theocratic.

The chief glory of monarchic Israel, however, was its prophets. They were different indeed from all other 'prophets'! With them the connexion of theocracy with shrines, maintained by the kings,[9] began to loosen. At times, again, the prophet must perforce denounce the priest. Yet the prophets, more than any else, were the true organs of theocracy. 'Thus saith the Lord' was their watchword. They spoke under the impulse of the Spirit. In a sense they kept God alive. It is true that, from the time of Elijah, Israel began to refuse their guidance, that at last the Northern Kingdom rejected it altogether, and that even in Judah they became the leaders only of a 'remnant.' But it was just this 'remnant' that meant so much for the future of the world. Israel is unique among theocracies because of its prophets.

The Exile was a signal proof of their greatness, for no other ancient people survived exile. 'To be carried captive' destroyed, as it was meant to destroy, nations and their gods together. Even in exile, however, Israel believed in the rule of its God. Of this creed the unknown prophet now called 'Deutero-Isaiah' was preacher *par excellence*. The Hebrew of the Return re-crossed the desert under the definite conviction that his God was leading him, as He had led Abraham.[1] In consequence a decisive change in the Hebrew idea of theocracy became complete. From Isaiah onwards the primitive notion that there were as many gods as there were nations had been gradually making way for the belief that there was but one God, and He the master of all nations. Only so could Jahweh save Jerusalem from Sennacherib, or redeem Judah from Babylon. Monotheism now entirely supplanted henotheism. While Israel was still Jahweh's 'peculiar treasure,' His theocracy was no longer limited to Canaan, but swayed the world.

Yet the immediate sequel was disappointing. 'Judaism'—to use the name appropriate after the Return—set out to be a pure theocracy. It rebuilt the old shrine; it gathered the ancient books; at length it made the ancient priesthood paramount. Yet it gradually became a splendid failure. The line of prophets dwindled away. The Jews looked in vain for kings like David. At last no priest dared, in the Lord's name, to add to His Law. And it seemed clear, besides, that the Lord did not rule the world. Theocracies tend to become hierarchies, and hierarchies tend to stagnate. Israel was now a hierarchy, and it looked as though Jahweh would sink to the level of the gods who had done great things in the past, but who did nothing in the present. The Jewish theocracy threatened to 'fossilize.'

Yet it escaped this fate. As the Psalms of the period show, there were always Jews who practised the creed that their God was still alive, and they knew that His time would come. The book of Daniel bears the same witness in a different way. It is the first apocalypse, and all apocalypses are theocratic. So, again, in its own way, is the book of Esther. The distinctive note of this epoch is not really its consummated ritual or its completed law, but its unextinguished hope. Israel believed that the future, as the past, was its God's and its own. There would be a perfect theocracy yet! The Kingdom of God would come!

There were two leading opinions about the way of its coming, readily separable in thought, though not always separated in fact. The one opinion found its aptest expression in the apocalypses. Broadly speaking, these expected a kingdom based on force, in which the Jew would rule all other nations—a kingdom won and maintained by a superhuman organ of God. This opinion laid hold of the external form of the old theocracy, kingship. It had an element of truth in it, for the NT has an apocalypse. In the interval before the perfect kingdom comes Christ does 'over-rule' all things and men, and this is a theocratic idea. Yet the other opinion is final for Christianity. Its earlier exponents were some of the later Psalmists; it lived in the quiet circles that 'waited for the consolation of Israel'; its perfect preacher was Jesus. He accepted the phrase 'the Kingdom of God,' and so looked for a theocracy, but He gave the phrase His own exposition and laid down the true method of the Kingdom's coming. It has been seen above that from the first a man who was the organ of

[1] *E.g.*, 1 S 10. [2] 1 S 10[5]. [3] 2 K 22[8] ('the' book). [4] 2 K 11, 22.
[5] Cf. G. A. Smith, *Jerusalem*, London, 1908, ii. 111 f.
[6] See footnote 7 on p. 287.
[7] Cf. 2 S 7[14]. The idea of a Divine monarch with an earthly vicegerent was quite common in the Semitic world (W. Robertson Smith, *Religion of the Semites*, lect. ii.).
[8] *E.g.*, 1 K 20[13]. [9] 2 S 6, 1 K 12[26ff.].

[1] Cf. Ezr 8[22].

Jahweh was thought of as 'filled with' His Spirit. This was why and how he knew God's will. More than once it had been discerned, even by OT thinkers, that a perfect theocracy, therefore, could come only if all its citizens, and not a few only, had the Spirit of Jahweh.[1] This idea is really central in Jesus' teaching, though He was able to teach it only as men were able to bear it. With the Acts of the Apostles it became explicitly the master principle of Christianity. At the same time there began the evolution of the Christian doctrine of the personality of the Holy Ghost. There can be a perfect theocracy only when every man acts always under the guidance of the Spirit of God. Here is the culmination of Biblical theocratic doctrine. Yet here also is its euthanasia. For this kind of 'theocracy' does not satisfy the definition given above. It is not a 'theory of national polity.' The Christian doctrine of the Holy Spirit is naturally individual, and as naturally universal, but it is not naturally national.[2] Again, the term 'polity' implies government and its coercions, and one of the marks of the Spirit's sway just is that it is incoercive. Yet the husk of Israel's theocratic idea held a kernel of 'eternal' value. The last human society will be a Kingdom of God.

LITERATURE.—For Josephus's use of the term 'theocracy' see *HDB*, *s.v.*, vol. v. [1904] p. 337 (V. H. Stanton); for the facts about the general Semitic notion of theocracy see W. Robertson Smith, *The Religion of the Semites*, London, 1894, lect. ii., and *The Prophets of Israel*, do. 1897, lect. ii.; for the development of the idea in Israel and in the apocalyptic literature see the standard authorities on the religion of Israel, the theology of the OT, and the extra-canonical Jewish books; the corresponding authorities on the NT discuss the relation of the idea of the Kingdom of God to the earlier theocratic doctrine. Separate treatment of the subject is unusual.

C. RYDER SMITH.

THEODICY.—1. The term.—Theodicy (Germ. *Theodizee*, adapted from Fr. *théodicée*, which is compounded of Gr. *θεός*, 'God' + *δίκη*, 'justice') means literally the (or a) justification or vindication of God. Leibniz appears to have been the first to use the word in its distinctive sense. In a letter written in 1697 he spoke of employing it as the title of an intended work,[3] and in 1710 the work duly appeared. The complete title was, 'Essais de Théodicée sur la bonté de Dieu, la liberté de l'homme, et l'origine du mal.' Since Leibniz's time the word 'theodicy' has been in common use.

2. The concept.—In modern usage the scope of the term is vague and ill-defined. Sometimes it is employed, as by P. Janet and G. Séailles,[4] as equivalent to natural theology or philosophy of religion. For those writers theodicy comprises the general problem of religion, though it is also understood by them in a more particular sense, as comprising only the central problems of the nature of God and the relation of God to the world. In either of these senses it may escape the charge of being a theory put forward 'to save the situation.'[5] But in the usual sense it does not so readily escape such a charge. For as a rule the use of the term is more in keeping with its literal meaning, and theodicy is understood as the (or a) vindication of the divine providence or government in view of the existence of evil. The 'theodicean' assumes the validity of the theistic conception of God as powerful, wise, and good, and on this basis seeks to defend the divine administration: he would

'assert Eternal Providence,
And justify the ways of God to men.'[1]

3. Origin of the concept.—The need of such a defence and vindication is not felt in primitive religion under polydæmonism, with its animistic or spiritistic view of nature, because under polydæmonism the world is subject to a multitude of spirits both good and evil, who limit each other and are themselves limited by the natural order. Nor is the need felt even at the polytheistic stage of religious belief, with its multitude or hierarchy of gods as distinguished from spirits or godlings, because at this stage thought, if no longer naive and instinctive, is still uncritical, and the gods are conceived as being subject to fate or necessity or as governing a world already given and never properly under their control. At the monotheistic stage of religion, however, where thought is become critical and reflective, the problem of theodicy arises and calls for a solution. Sometimes, as in Persian religion, a dualism in the divine nature is postulated, and the world represented as the scene of a grand conflict between the principles of good and evil, in which good is destined to final triumph; and obviously a dualistic philosophy of religion, if it could be otherwise satisfying, would ease the problem. Under a monistic philosophy of religion, again, the tendency is actually to get rid of the problem, by minimizing evil or even by reducing evil to illusion. This tendency is observable in the cosmic and acosmic pantheisms of Stoicism and Brāhmanism respectively. Only in a philosophy of religion in which God is recognized as wholly good, and evil as truly evil, is the problem of theodicy felt in all its insistence. *Si deus bonus, unde malum?* Christianity, theistically interpreted, supplies such a philosophy, and in the course of Christian history the problem of theodicy received distinctive treatment in the ecclesiastical doctrine of the Fall. Whatever may be said as to the form of that doctrine, it stands for a principle which should be acknowledged in theistic interpretations of the world, namely the principle of human freedom and responsibility. It is not without significance that the classical theodicy or theistic apologia of Leibniz bears in its title not only 'the goodness of God' and 'the origin of evil,' but also 'the freedom of man.'

4. Leibniz's Théodicée.[2]—(*a*) In the problems of theodicy Leibniz had been interested since his boyhood, and he claims to have given more attention to them than most.[3] There are many references to them, certainly, in his correspondence during the last decades of the 17th cent. with Pellisson, Bossuet, and others; and the *Essais* itself also bears ample witness to his long-continued interest in them. It should be remarked, however, that the *Essais* is not, properly speaking, a systematic presentation of the questions involved in theodicy. It is, in Leibniz's own word, a 'tissu'[4] of what he had said and written in the course of the theological and philosophical discussions, centred in Pierre Bayle's works and especially his *Dictionnaire historique et critique*, which he carried on with Sophia Charlotte, queen of Prussia. From a letter of Leibniz's written to Sir Thomas Burnett in 1710 it appears that the *Essais* was compiled at the request of his friends and as a memorial to the deceased queen.[5] The book was extraordinarily popular, and apparently the author finds satisfaction in recording that it was welcomed

by Catholics as well as Lutherans and Evangelicals.[1] No doubt the *Essais* served its purpose well in an age of theological rationalism, and helped to stem the tide of scepticism which was now beginning to threaten the foundations of religion itself.[2] But Leibniz's theistic apologia does not commend itself so readily in our time.

(*b*) It will be sufficient for the purposes of this article to indicate a few salient points in Leibniz's theodicy, for the sake of illustrating the difference between the older and the newer theism in apologetic method and outlook.

(1) *God.*—Unlike most recent exponents of a theistic philosophy of religion, Leibniz was of the belief that the being or existence of God could be demonstrated by purely logical or rational processes. Though he recognized, he did not make much use of, the ontological proof, and the proof, so peculiarly his own, from the 'pre-established harmony' is bound up very closely with his monadology; but the cosmological or ætiological proof and the proof from the eternal truths are both characteristic of his theology or religious philosophy and independent of his ontological scheme. In accordance with the principle of the cosmological or ætiological proof, Leibniz starts from the world of finite existents as contingent and infers an Existent which is not contingent but metaphysically necessary. There must be a sufficient reason or cause, he says, for the existence of the whole collection of contingent things which composes the world, and it is to be found in the Substance which carries with it the reason or cause of its own existence, and which is consequently necessary and eternal; and that Substance can only be God.[3] It may be objected to this argument that it is logically fallacious, as containing more in the conclusion than is contained in the premiss: as the premiss is contingent, so must also be the conclusion.[4] As for the proof from the eternal truths—*i.e.* truths which involve no reference to time or to the world of existents in time—it is largely dependent upon Leibniz's notion of possibility. For Leibniz, as not for Spinoza, the possible was wider than the actual, essence than existence; and he argues that, if the eternal or metaphysically necessary truths are real, and founded on something existent, that existent something must be the metaphysically necessary Being of God, in whom essence involves existence, and to be possible is to be actual. Without God not only would there be nothing existent, but there would be nothing possible.[5] Against this proof, as handled by Leibniz, it may be urged that it is inconsistent in one who regards the possible as wider than the actual, the essential than the existent, to regard truth as dependent upon existence; and that in any case we cannot on the premisses reach a necessary Being separate from the existent and actual world. In all such arguments indeed, as B. Russell points out, there is difficulty in avoiding Spinozism.[6]

(2) *The world.*—In presenting what may be named his teleological optimism Leibniz still moves on the high plane of metaphysical notions and *a priori* verbal proof, nor condescends to the lower empirical world, to which Bayle would bring him down. Founding upon the principle of sufficient reason and the idea of divine perfection, he holds that this is the best of all possible worlds; for, were a better world than this world possible, God would have chosen it. God is absolutely powerful, wise, and good; and His goodness moved Him to create and produce all possible good, His wisdom led Him by a moral necessity to the choice of the best, His power enabled Him to execute His great design.[7] It is curious to reflect that the Leibnizian optimism may be associated with the most diverse ethical valuations of life, optimistic, pessimistic, melioristic; which gives point to Schopenhauer's objection that, even if this is the best possible world, it does not prove that it is a world good enough to have been actualized.[8] An objection, this, on philosophical grounds, thus meeting Leibniz on his own plane, but it is on empirical grounds that the Leibnizian optimism has been most frequently challenged, from Voltaire's *Candide* down to the present. Nor could Leibniz himself ignore the empirical aspect of the problem of theodicy.

(3) *Evil.*—Accordingly—apart from his metaphysical theory of evil as necessary limitation appertaining to finite existence and the source of both moral and physical evil—we find him emphasizing the instrumental theory, according to which evil, especially physical evil, is to be interpreted as an instrument or means of good. In advocating this theory he sought to counter Bayle's contention that the strength of Manichæism was due to its conformity with an empirical rather than *a priori* conception of the world. Even from the empirical standpoint, Leibniz would reply, physical evil may be reasonably accounted for by the theory of instrumental value; and, as for moral evil, it could not be prevented by God without the subversion of the freedom of self-determination which belongs to spiritual beings and makes morality possible. By other empirical arguments also Leibniz supports his doctrine of optimism, but enough has been said to show that, while his theodicy is forced to recognize the standpoint of experience, it rests primarily—like his theistic proofs—on metaphysical considerations.

(*c*) The difference between Leibniz's theodicy and the modern attitude in theodicy may now be briefly stated. Leibniz approached the problem of evil with a God whose existence had already been proved, as also His character of absolute perfection in power, wisdom, and goodness; and it was therefore an altogether reasonable presupposition on Leibniz's part that this world as being the creation of such a God was the best possible. No matter what exception might be taken to the case as presented, the case itself was excellent. But nowadays, with the spirit of pessimism abroad in society, and the spirit too—not unakin—of anti-religious agnosticism, the problem of evil has become more acute, and one has learned to sympathize with W. James and others in their impatience with Leibniz's optimism and the complacency of his attitude towards, *e.g.*, a dogma like eternal punishment. The 'charmingly written *Théodicée*' is even described by W. James as a piece of 'superficiality incarnate'; as a 'cold literary exercise, whose cheerful substance even hell-fire does not warm.'[1] Such strictures are too severe, but let them be a reminder of the difference in spirit between the old and the new approach to the problem of evil. It would be quite untrue to say of modern exponents of theism that they compose theodicies 'with their heads buried in monstrous wigs.'[2] The modern theist is conscious of the failure of rationalistic or purely speculative theology to establish its claims, and of the necessity of fundamentally empirical methods in theology if scientific results are to be gained, and he therefore examines the world of experience in face of evil as an empirical problem, with the view of testing the reasonableness of the theistic faith in God as just, holy, and loving. And he is led to recognize that the observed facts of nature and history do not afford an unexceptionable argument for the goodness of God, and that after all the most solid ground of belief in the divine goodness lies in the needs and claims of the religious consciousness.[3] No doubt there would be a *circulus in arguendo* involved here if such considerations were put forward as a solution of the problem of evil.[4] On the one hand, it is by the faith of religion that God is affirmed to be perfectly good, despite the evil to be found in the world of His creation and governance. On the other hand, religious faith is based on the power of religion as a solvent, or at least a partial solvent, of the problem of evil: in religion men seek refuge from the various evils that assail, from without and from within—which shows that a non-rationalistic theism could not offer a real solution of the problem of evil. Nor does it profess to do so.

5. Theodicy and philosophical reflexion.—It is not necessary that this article should enter into a comprehensive discussion of the problem of theodicy from the side of philosophical explanation. This will be found in the art. GOOD AND EVIL, where it is affirmed with most students of the subject that 'every proposed solution either

leaves the old question'—*si deus bonus, unde malum?*—'unanswered or raises new ones.' None the less we should like to express our sympathy with a type of solution—partial as it must be—which is on the lines of Leibniz's theology, but which goes beyond Leibniz in its recognition of human freedom as real, in the sense of implying self-limitation on God's part. Self-limitation does not mean finitude, nor freedom unqualified indeterminism. Such a solution is not only consistent with the moral and religious consciousness, but alleviates also the burden of the mystery of evil; and it lends itself to attractive exposition in the speculative sphere, as in the humanistic or personalistic idealisms which arouse so much interest at present. Yet it still leaves God, as indeed must every theodicy, ultimately responsible for both physical and moral evil. At the same time the recognition of the instrumental worth of evil somewhat relieves the weight of the divine responsibility. Take it first in connexion with the problem of physical evil. Pain and suffering are no doubt largely retributive and to be accounted for as the wages of individual and racial sin. But retribution is not an end in itself, and the positive rather than the negative purpose of physical evil is being more and more emphasized. Through pain, hardship, and loss moral energy may be stimulated and character moulded and shaped to finer issues. In this aspect of it suffering may be twice blessed, blessing those who suffer and those brought into contact with them. Take it also in connexion with the problem of moral evil. Here again the instrumental theory applies, and evil may be regarded as for education and discipline. In fact many theists regard moral evil or sin as having been always under the divine control, and interpret it as necessary like physical evil to human development. It is the discord without which there could be no harmony, the shade without which there could be no light. Through sin man learns his weakness, and his need of strength from on high. Through sin, and its direful effects in society, he learns the meaning of brotherly service and the measure of the sacrificial love of God.[1] Christianity looks for the time when man's moral education shall be brought to completion, and his suffering and sin have served their purpose. Yet, when all is said, the problem of evil remains.

6. Theodicy and the religious consciousness.—The discussion of the problem of evil on empirical grounds, and in particular of the instrumental theory of value, leads us to a consideration of the religious solution. There is a philosophical theodicy, and there is a religious theodicy. In the first, evil is explained—or an attempt is made to explain it—in the light of the divine goodness; in the second, evil is not explained, nor is there any attempt to explain it—it is simply to be overcome. As Eucken has remarked, 'religion does not so much explain as presuppose evil';[2] and, as P. T. Forsyth so well insists, a religious theodicy is not 'an answer to a riddle but a victory in a battle.'[3] In a religious theodicy it is not man who justifies God's ways, but God who justifies His own ways, and that not by accounting for the world's evil, but by saving men from it. While this is said, religion can no more than philosophy escape the problem of evil. For the individual believer in God and His goodness the problem receives a practical solution through the victory of his faith: he estimates life no more by hedonistic standards, but discovers the Supreme Good in moral and spiritual union with God. From the universal point of view the religious solution of the problem may be stated broadly in terms of the teleological idea. The end or purpose revealed in the universe is the creation of free ethical personalities capable of personal intercourse with God and of reflecting as in a flawless mirror the divine image and likeness.[1] To that purpose the presence of evil is subservient, and there are traces of it even in animate nature, which we have too often regarded as merely a field of struggle and carnage.

'There is a legitimate scientific sense,' says J. Arthur Thomson, 'in which it may be said that Man is part of the system of Nature and the crown of its evolution; and it is assuredly of some significance that he can find in Animate Nature far-reaching correspondences to his ideals of the True, the Beautiful, and the Good.'[2]

We might therefore be content to state our theodicy in the following terms, which give due regard to the fact—made clear in modern science—that our world is still in the making, and which also illustrate the newer empirical as distinguished from the older rationalistic way of approach to the problem of evil, as well as the pragmatic tendency in modern theology and religious philosophy:

'While this world is far from being as yet the best possible world, nevertheless in view of its general constitution it may be regarded as the best possible *kind* of world in which to have man begin his development, and . . . the evils which exist in the world furnish no good reason for abandoning belief in a God who is both good enough and great enough to meet every real religious need.'[3]

LITERATURE.—References to the problems of theodicy may be found in works on the history and philosophy of religion, dogmatic theology, and general philosophy. See in particular the literature mentioned in the artt. GOOD AND EVIL, PESSIMISM AND OPTIMISM. Useful discussions will also be found in the following works, selected chiefly from recent philosophical and theological literature: O. Pfleiderer, *The Philosophy of Religion*[2], Eng. tr., 4 vols., London, 1886–88, esp. iv. 1–45; G. T. Ladd, *The Philosophy of Religion*, 2 vols., do. 1906; G. Galloway, *The Philosophy of Religion*, Edinburgh, 1914; J. Müller, *The Christian Doctrine of Sin*, Eng. tr., 2 vols., do. 1877, 1885; H. Siebeck, *Lehrbuch der Religionsphilosophie*, Freiburg i. B., 1893; J. Kremer, *Das Problem der Theodizee in der Philosophie und Literatur des 18 Jahrhunderts*, Berlin, 1909; O. Lempp, *Das Problem der Theodizee in der Philosophie und Literatur des 18 Jahrhunderts*, Leipzig, 1910; J. Martineau, *A Study of Religion*[2], 2 vols., Oxford, 1899; J. R. Illingworth, in *Lux Mundi*[15], London, 1904; C. F. D'Arcy, *God and Freedom in Human Experience*, do. 1915; B. H. Streeter and others, in *God and the Struggle for Existence*, do. 1919; J. WILLIAM FULTON.

THEODORE OF MOPSUESTIA.—See ADOPTIANISM, ANTIOCHENE THEOLOGY.

THEOGNIS.—Theognis is the name attached to a collection of some 1389 erotic, convivial, reflective, and hortatory elegiac verses whose chief interest for this article is that they are the fullest extant repertory of Greek ethical commonplace in the half-century preceding Plato and the tragedians. The collection begins with invocations to Apollo, Artemis, and the Muses, and a dedication to a young friend Cyrnus, to whom many of the quatrains and couplets are addressed, and whose name may be meant by the seal that perhaps marks their genuineness.[4] But many verses lack this certification. Some are addressed to other

[4] Line 19.

friends, including a Simonides who may be the poet.[1] After the first 100 lines there is little sequence or coherence of ideas. There are many repetitions, and some of the verses occur in the fragments of Solon, Phocylides, Tyrtæus, and Mimnermus. These considerations, and the fact that quotations in Plato[2] and in a passage attributed by Stobæus[3] to Xenophon are susceptible of various interpretations, raise many problems about the composition of the poem, if it is in any sense a unity, and have given rise to an extensive German literature of hypothesis most conveniently surveyed in E. Harrison's *Studies in Theognis*.[4] Harrison argues plausibly, if not always quite convincingly, that the poems as they stand form a connected sequence. His book concludes with an excellent chapter on the life and times of Theognis. He was a noble of Nisæan Megara, who apparently at one time was also a citizen of Hyblæan Megara in Sicily. He spoke of the terror of the Medes,[5] and is therefore conjectured to have lived to see the invasion of Xerxes. He lived in a time of social and political revolution at Megara, vaguely known to us from three references in Aristotle's *Politics*[6] and from one passage in Plutarch.[7] His temper was embittered by the temporary triumph of the popular party,[8] the loss of his property,[9] and the exile,[10] which was perhaps the cause of the travels in Eubœa, Sparta, and Sicily to which he refers.[11] To these experiences we may trace his pessimism,[12] his cynicism,[13] his harping on the hardships of poverty that constrains a man to deeds to which his will does not consent,[14] his complaint that money makes the man and that mercenary marriages corrupt the breed of men,[15] his emphasis on the virtue of faith[16] or loyalty to caste, club, and mates[17] in times of trial, and his frequent use of 'good' and other ethical terms in the political or social sense.[18]

Too much has been made of this last idea by Theognis's translator J. H. Frere,[19] by Nietzsche, whose own philosophy is largely based upon it, and by Grote, who, however, admits that the ethical meanings are not absolutely unknown.[20] Theognis is merely the chief example, the conveniently quotable *locus classicus*, so to speak, for a natural human tendency. We still speak of the better classes as they did in Aristotle's time,[21] and Homer characterizes menial tasks as the services that the worse sort perform for the good.[22] We cannot infer that the ethical idea was lacking.[23] We can only say that before Plato it was easier to confound pure or absolute ethics with prudential, conventional, tribal, caste, or political morality than it has been since. Much the same may be said of the naive inconsistency between Theognis's general commendations of truth, justice, good faith, and kindliness, and his passionate prayers for vengeance,[24] his (perhaps ironical) counsel to set your heel on the empty-headed demos,[1] to be all things to all men,[2] to adapt yourself to your environment with the protective resemblance of the polyp which takes the hue of the rock to which it is clinging,[3] and to flatter and cajole your enemy well till you have him in your power and then take your revenge.[4] The last precept appears almost as nakedly in one of the noblest Greek poets, Pindar.[5] Plato first laid it down that the good man will not wrong even his enemy, and Plato did not apply the principle to international politics in the Tolstoyan way. Lastly, the erotic verses of Theognis—most of them, to be sure, in a separable and perhaps spurious part of the collection,[6] dealing with themes repugnant to modern feeling — seem to us incompatible with the conception of him as a moralist and still more with the use of his elegies as a school-book. They were indeed, on the hypotheses of R. Reitzenstein,[7] mainly banquet songs. But, however that may be, Theognis's own use of the verb 'admonish'[8] classes them in some sort with the literature of prudential precepts and moral admonition known by the name of ὑποθήκαι.[9] And no less a moralist in his own esteem than Isocrates recommends the study and excerpting of them as entirely edifying. At any rate, whether in excerpts for school use or otherwise, they were, like Solon and Hesiod, learned by heart by educated Greeks of the 5th cent., and so provide many texts for amplification in Pindar and the Greek drama, and for discussion in Greek philosophy.[10] An exhaustive dissertation on this subject would be of interest, but would require the nicest discrimination. Harrison[11] collects the parallels in Pindar and Bacchylides, some of them perhaps overstrained. It is not easy to determine how many of the resemblances in tragedy are conscious reminiscences. The chorus in Sophocles, *Œd. Col.* 1226 ff., is clearly an expansion of the melancholy lines 425 ff. :

> 'Not to be born into life were the best for us, creepers on earth's face,
> Never to look on the sun's burning and pitiless rays;
> Happiest lot of the living is theirs who come quickest to Hell Gate
> Laid out quiet and stark, wrapped in a mantle of earth.'[12]

Jebb on *Antigone*, 622, quotes Theognis, 403, as one of the anticipations of the untraced 'quem Juppiter vult perdere dementat prius.' *Antigone*, 297, echoes Theognis, 221, in the sentiment that the man who thinks that he alone is wise is himself void of wisdom. Soph. frag. 356 repeats the commonplace that health is best and justice fairest of things;[13] frag. 525 the humorous fancy that even Zeus cannot please all, whether he rains or holds up.[14] But these are only conspicuous examples of an indeterminate list. When Euripides praises the man who is as true to absent as to present friends,[15] we cannot be certain whether he is or is not paraphrasing Theog. 93–95, and the same holds of the coincidence between *Phœnissæ*, 438–440, and Theog. 717 f. in the sentiment that

wealth is all-powerful. Plato's saying[1] that a spirit of reverence (*αἰδώς*) is a better inheritance than great riches is, the present writer thinks, a distinct reference to Theog. 409. Isocrates, i. 19, equals Theog. 72, and i. 29, Theog. 105.

Among the chief commonplaces of Greek ethics expressed by Theognis[2] are man's dependence on the gods,[3] and his ignorance of what the future has in store,[4] his duties to the suppliant and the guest,[5] and to parents,[6] the doctrine of the mean,[7] of nothing too much,[8] of *κόρος* and *ὕβρις*,[9] the late punishment of the wicked,[10] the dangers of slander [11] and of light oaths,[12] the admonition that all true gains are costly,[13] that ill-gotten gains do not abide,[14] that the lust for wealth is insatiate,[15] and that the boastful word (*ἔπος μέγα*) [16] or the forsworn forecast [17] provokes the gods and invites nemesis, the complaint that shame and reverence are exiled from a degenerate world,[18] and that men value nothing but wealth.[19] Other commonplaces, whether of ethics or of criticism of life, are the immortality of song,[20] the praise of patience,[21] the Anacreontic, Epicurean, or Horatian 'Carpe diem,' evil communications,[22] 'in vino veritas,'[23] there is no perfect man,[24] the ingratitude of children,[25] the foible of censoriousness and self-praise,[26] and the generalized metaphor of the 'counterfeit' man.[27] His convivial and social precepts, his slight anticipations of later motives of satire,[28] and his somewhat cynical, political,[29] or worldly wisdom[30] do not further concern us here. Lines 823 and 1181 are in apparent contradiction on the justification of tyrannicide. Theognis apparently does not mention the confounding of the innocent with the guilty, or the jealousy of the gods except as involved in the nemesis that attaches to the too confident oath.[31]

As an aristocrat he, like Pindar, emphasized nature against teaching.[32] No teacher can put sense into a man,[33] or make a bad man good. Plato[34] finds a contradiction between this and the admonition to associate only with the good because from them you will learn good only. But it is Theognis's belief that it is easier to corrupt the good than to reform the bad. In lines 155–159 there is a suggestion of the noblest thought of mature Greek ethics, the idea that the mutability of fortune and our common frailty impose the duty of leniency and compassion upon all men.[35]

Especially interesting are Theognis's direct appeals and protests to Zeus. He complains that the prosperity of the wicked casts doubt upon the moral government of the world.[36] This, however, is rather a development of the motive of Menelaus's speech in the *Iliad*[37] than the startlingly new thought which Croiset finds in it.[38] Theognis's protest against the visitation of the sins of the fathers upon the children, which results from the late punishment of the wicked,[1] invites illustration both from the OT and from later ethical literature.[2]

LITERATURE. — The fullest recension of the text is in the latest ed. of T. Bergk's *Poetæ Elegiaci*, Leipzig, 1915. The edd. of Immanuel Bekker (Leipzig, 1815) and F. G. Welcker (Frankfort, 1826) and the critical literature of the subject are discussed in Harrison's book referred to above. Cf. also T. Hudson Williams, *The Elegies of Theognis*, London, 1910.

THEOKRASIA.—See GREEK RELIGION, vol. vi. p. 421 f.

THEOLOGY.—**1. Definition.**—Theology may be briefly defined as the science which deals, according to scientific method, with the facts and phenomena of religion and culminates in a comprehensive synthesis or philosophy of religion, which seeks to set forth in a systematic way all that can be known regarding the objective grounds of religious belief.

According to its etymological meaning, the word 'theology' denotes 'discourse or doctrine concerning God.' In this sense it was used among the Greeks to describe the work of poets like Homer and Hesiod when they wrote of the gods and their doings, and that of philosophers like Plato and Aristotle when they speculated regarding the supreme reality or ultimate ground of all things. In early Christian literature the distinctive appellation of 'theologian' is applied to the author of the Apocalypse, probably because he maintained the divinity of the *λόγος*, asserting the identity of the *λόγος* that became flesh in Christ with God (*Θεός*). In this sense the term is applied to orthodox Greek Fathers like Athanasius and Gregory Nazianzen, who distinguished themselves in defending the personality and divinity of the *λόγος*. But doctrine concerning God—His being and attributes—is only one branch or department of theology, as that is now commonly understood. Man's knowledge of God is part of the content of that matter of human experience which is termed 'religion,' and which includes other content also, referring to the world of nature and of man, to sin and death, to salvation and immortal life. And, as science in general deals with some definite department of human experience, it is more in accordance with the proper conception of science to regard theology as that branch of science which deals with the department of human experience known as religion, from which experience man's knowledge of God and divine things is obtained. Theology is the science which, by right use of reason, in accordance with proper scientific method, correlates, systematizes, and organizes the matter of human religious experience in such a way as to reach a unified body of coherent doctrine, fitted to satisfy the mind's demand for truth and to furnish guidance for the practical life.

As the science of religion it deals not merely with the subjective contents of the religious consciousness, or the opinions, emotions, and actions of men in the religious sphere, but also with the objective grounds of religion and the ultimate truth or reality which underlies and explains the religious experience of mankind. It is not merely the science of religions dealing with the various historical religions which have developed among men (though that is a part of it), but the science of religion regarded as an important department of human experience, which claims to be no mere subjective delusion, but to have a real and rational foundation in objective reality or fact.

2. Theology and religion.—As theology is the science of religion, religion precedes and is wider

than theology and furnishes it with the matter with which it deals. In all departments of human life and activity experience, in which feeling, intuition, and volition are the predominant factors and reason or intellection is as yet implicit, precedes theory or science, which seeks to exhibit and make explicit the reason, thought, or principles of truth and reality underlying and accounting for the experience. Thus the use of numbers in the relations and activities of the practical life precedes the science of mathematics; the practical use of speech precedes the science of language; the use of reasoning in practice precedes the science of logic; and the sailing of the seas in ships precedes the science of navigation. So too the experience and use of religion as a practical factor in life's activities precedes the science of religion, or theology. And, as men may attain considerable efficiency and success in various departments of life without having rationalized or reduced their experience to system and exhibited its underlying principles, so men may live a truly religious life and have a rich and full religious experience without having attained to any very clear or coherent system of theology. But, while a man may be religious without being a theologian, religious experience is necessary to enable a man to be a competent theologian; and the fuller and richer his religious experience has been, the more likely is he to prove a trustworthy and satisfactory theologian.

Schleiermacher was so impressed with the importance of the part played by feeling or emotion in religion that he gave it not merely the predominant but the exclusive place. Over against the long prevailing definition of religion as consisting in 'knowing and doing homage to God,' he defined religious piety as in its essence consisting neither in knowledge nor in action but in a determination of the feeling. The root of all religion he held to be man's feeling of absolute dependence on some power or powers other than himself. But this dictum, while it emphasizes the important truth as to the large part played by feeling in religion, if strictly taken, is one-sided and exaggerated, in that it ignores the part played by the cognitive faculty in forming some conception, more or less definite, of the power or powers on which we depend, and the part played by the will in choosing and adopting means for getting into harmony with that Supreme Power or Being, which are elements characteristic of all religion.

In theology, as distinct from religion, the cognitive faculty, or reason, is predominant. It succeeds religion, and seeks by a right use of reason on the matter of experience furnished by religion to evolve out of it a system of connected and coherent truth to which the term 'science' can be properly applied.
